Misdiagnosis

The developmental dimensions of India's recent external debt crisis have been by and large side-tracked by lender agencies and concern with short-term liquidity aspects has led to the recommendation of economic reforms packages which are often antithetical to growth. The two aspects of the debt issue, the developmental and financial dimensions, bring to light a basic incongruity between the diagnosis and the remedial measures implemented. 805

State in Singapore

Over the last three decades Singapore has been able to combine good macro-economic performance and good social and demographic indicators with authoritarian policy and corporatist management. Are there lessons for India? 795

Rejecting Ram

The BJP's espousal of communalism as a political device has partly misfired, at least in Uttar Pradesh. Whereas the upper castes have clearly taken to Ram as a political device, the OBC/SC/Muslims continue to maintain an ecumenical attitude. 777

Sacred Cows

The logic of Narasimha Rao's 'middle path' in economic reforms is simple: while attention must be paid to maintaining the base of the social pyramid, the middle and the top must not be hurt. 773

Ethical Questions

The values which inform the decision to build a huge technological project encompass not only scientific and technical issues but social and political factors which pose conflicting ethical questions. 813

Power to the Panchayat

Self-government of any kind must have not only a clearly demarcated field of activities, but also the instruments with which to govern in this field. For this, panchayats must be endowed with the power to recruit and control their own staff. 789

Appalling Neglect

The lack of state support for Urdu education has not only led to a deterioration of educational standards but has devalued the language. 782

No Loss

The Madhya Pradesh chief minister's proposal to lower the height of the Sardar Sarovar dam will reduce power eventually available to the state, but will also reduce submergence area. 774

Flashback

If the resolutions of the Indian History Congress on Ayodhya had been taken seriously, the political climate in the country may well have been different now. 776

Export Orientation

Child labour in the carpet industry is obviously becoming a concern for the government—because it affects exports of the product. 794

Counterproductive

The policy of keeping exchange rates deliberately undervalued, may turn out to be counterproductive, because it not only fails to correct the external trade imbalance but affects industrial growth by making the cost of necessary imports prohibitive. 819

Kerala Panchayati Raj Bill

THE Kerala Panchayati Raj Bill that is being sent to a Select Committee this week, and is expected to be passed by the state legislature by April 20, proposes in effect to centralise power in the hands of officials at the state level, instead of decentralising it among the people as has been intended all along since panchayati raj institutions were accepted in principle, more than three decades ago, as the foundation for political and economic decentralisation in India. This is an astonishing distortion, indeed travesty, of the ideals that have guided this country since Mahatma Gandhi began to lead the freedom movement. Precisely for that reason, the present effort in Kerala, under the auspices of a government led by the Congress Party, has to be countered and defeated by organising and mobilising public opinion within the state to the extent possible in the next three weeks.

The commissioner, proposed to be appointed under the panchayati raj system should really have no powers beyond scrutinising the technical aspects of the budgets presented by individual panchayats. Instead, under the proposed bill, he has not only powers to add and delete items from these budgets but is also authorised to intervene in the day-to-day functioning of the panchayats. The bureaucracy, represented in the proposed system by the commissioner at the state level and by deputy commissioners at the district level, has in effect crucial veto powers which, if resorted to, can reduce panchayati raj to a tragic comedy.

Long before the Panchayati Raj Bill was framed, the state government had taken action to ensure that the requirements of effective panchayati raj as an instrument of democratic government were adequately examined and studied in depth. This was in fact done in great painstaking detail by no less a person than V Ramachandran, who was for many years the chief secretary to the state government. Ramachandran continues to be associated with the state government as vice-chairman of the State Planning Board. It appears he has not been consulted in the preparation of the bill that is now being presented to the state legislature, as its provisions run counter to many of his earlier findings and recommendations. There are however other more compliant members of the bureaucracy willing to fall in line with those in overall political command.

There is provision in the proposed bill for removal of the president or vice-president of a panchayat and for debarring members of panchayat from contesting in the elections for five years. This is bound to be used for purposes in gross violation of the principles of panchayat raj. Such powers should be vested with a permanent judicial commission, and not with any political or bureaucratic body.

Both political leaders and the bureaucracy at the state level have strong vested interests in retaining power in their own hands and in sharing them as little as possible with representatives of the people at the panchayat level. If their power and influence are not countered from the outset there will be in fact no effective decentralisation and no democracy at the grass roots. This is what the proposed bill tries to ensure.

It is therefore of the utmost importance that a major restructuring of the proposed bill is undertaken at the stage of the Select Committee that is now to consider it, as well as in the state legislature later through the combined efforts of enlightened members of the ruling party as well as members of the opposition. There is no time to be lost in making the general public also aware of what is at stake, to make sure that an environment is created in the state that makes it impossible to make a caricature of democracy at the grass roots. This is the least we owe as a duty to Mahatma Gandhi today.

PDS Reform

I HAVE some comments on the article on PDS by Jos E Mooij (January 15). With a simple calculation we can see that targeting of PDS towards, say, 6 crore needy families, giving every family a comparatively high (Kerala-level) monthly benefit of Rs 40, cost 12 × 40 × 6 = Rs 2,880 crore, which is about the same as the present outlays on PDS. If, in the light of structural adjustment programmes, PDS is to be made really effective, a monthly benefit of Rs 40 is still very small. However, it is about three times as much as the present benefit, and it would certainly lift a number of low-income families to the poverty line.

Given the tight budgetary situation in India, targeting is extremely necessary and effective. That is why it is strange that the author hails the situation in Kerala, where almost every family has access to PDS, and where the ration card is used as an identity card. That is an injustice (subsidising the rich) and a huge waste of scarce resources, with which quite a few families, inside or outside Kerala, could reach the poverty line.

If India wants to progress economically, there is no alternative to taking unpopular measures. The government (at least the central government) has shown that it is not avoiding these kind of steps. That is why there is no reason to rule out the possibility of PDS reform, as the author does.

ECONOMIC AND POLITICAL WEEKLY

Inflation's Return

EVERY aspect virtually of the government's economic management threatens to fuel price increases, particularly prices of commodities of common consumption. Apart from the phenomenally large revenue and gross fiscal deficits, the 1994-95 budget has opted for larger consumption expenditure in preference to productive and capital expenditure. The budget has done nothing to encourage saving; rather it has provided every stimulant to encourage consumption even as the disposable incomes of the relatively well-to-do have been augmented through tax reductions. Domestic saving and investment rates have declined in the three years from 1991-92 to 1993-94. Government policies are stoking liquidity growth at a time when productive investment continues to be sluggish and when the institutional and instrumental channels for directing larger flows of investible funds to agriculture and rural industries are choked. As a result, the growth of liquidity can only lead to build-up of speculative inventories of consumption goods. On the supply side, while there is growing availability of goods of middle and upper class consumption, both domestically produced and imported, the prospects for goods of mass consumption hinge precariously on the country experiencing a seventh successive year of buoyant rainfall in 1994-95. The large food stocks with the public procurement agencies and the impressive level of foreign exchange reserves are not sufficient safeguards against rise in the prices of essential consumer goods. Apart from the fact that the public agencies carry stocks of only rice and wheat, their operations have increasingly begun to be inflation-stimulating rather than inflation-containing. Overall, the hold of rich farmers and traders on rice and wheat marketing has tightened. Ministerial declarations of intent to effect large exports of rice and wheat have tended to push up prices of these major cereals in the open market. Besides, there are indications of acreage and farm investment in the agriculturally-advanced states getting diverted from cereals and pulses. As it is, the budget for 1994-95 has given a clear signal of reduced public investment in agriculture. Finally, in industry, apart from increases in raw material costs, the high real interest burden and, in many cases, the fact that product prices have been sluggish for quite some time reduce the scope for further containment of price increases, signs which are already visible in some basic industries.

The current trend of inflation has thus to be judged against some of these macro-economic developments. The over-the-year rise in the general index of wholesale prices (WPI), which had been running at a little over 7 per cent on the eve of the 1993 kharif season in October, has been creeping up since then and has, after some fluctuations, now touched 9.9 per cent as on March 19. The 1993-94 financial year has so far experienced a 9.8 per cent rise in the WPI against a rise of 7 per cent in the same period of 1992-93. And if final and not the provisional figures of the WPI are taken, the inflation rate should be well above the double-digit level. Further, but for the recession in the basic and capital goods industries, many of which have as a result shown only small increases in prices—machinery and machine tools 1.1 per cent, automobiles 2.1 per cent and cement 0.8 per cent—or even absolute declines, the inflation rate would have touched the double-digit level quite some time back. Thus the rise in prices of many agriculture-based raw materials and basic consumption goods has been very sharp indeed. The WPI for fibres as a group shows a rise of 75.8 per cent over the past year and, within the group, raw cotton prices have risen by 36.7 per cent, raw jute by 117 per cent and raw wool by 57.4 per cent. And, despite the large food stocks, wheat prices have risen by 10.6 per cent and much larger increases have taken place in the case of bajra (35.2 per cent), maize (15.4 per cent) and barley (24.6 per cent); pulses as a group (36.2 per cent) and, among pulses, gram (65.9 per cent), arhar (20.1 per cent), moong (23.7 per cent) and urad (18.4 per cent); vegetables (39.3 per cent) and, among them, potatoes (59.2 per cent), onions (124.2 per cent), green peas (48.1 per cent) and cauliflower (12.3 per cent); coffee (30.3 per cent); the sugar, khandsari and gur group (28.3 per cent) and, within it, non-levy sugar (36.3 per cent), levy sugar (10.9 per cent), khandsari (31.3 per cent) and gur (34.5 per cent); cotton textiles (9.9 per cent); and the electricity group (33.2 per cent). No doubt some commodities like coconuts, condiments and spices, edible oils and tea have experienced either more moderate increases or even some decline in prices, but the widespread nature of large price increases clearly suggests that the official series of consumer price indices grossly underestimate the rise in consumer prices. The CPI for industrial workers (base: 1982 = 100) shows a rise of only 8.2 per cent during April 1993-January 1994 compared to 5.2 per cent in the previous year and that for agricultural labourers (July 1960-June 1961 = 100) shows a rise of 10.7 per cent during April 1993-January 1994 against 1.9 per cent in the same months of the previous year.

While the government's grossly inadequate supply management policies have contributed to the accelerating inflation, the vast increase in liquidity in the system in the face of slow economic growth and rapid growth of consumption expenditures at the government and household levels cannot but fuel inflationary expectations in the new fiscal year and the situation could turn critical if agricultural production turns out to be less than satisfactory. Compared to the initial target of 12 per cent and the revised target of 14 per cent for growth of broad money (M_3) in 1993-94, actual monetary expansion so far (up to March 4) has been 16.9 per cent and the year may well have ended with broad money growth of not less than 18.5 to 19 per cent. Even more damaging has been the 23 per cent rise in reserve money

during the period, against the increase of only 3.7 per cent in the previous year. Constrained by the structural adjustment policies, the Reserve Bank has been rendered acutely short of monetary instruments to mop up or sterilise the liquidity growth arising from the rising foreign exchange accruals. As a result, the flood of liquidity has begun to play havoc in the financial system as well as in the stock and commodity markets. Short-term interest rates on market-related instruments like commercial paper (CP) have fallen to exceptionally low levels. Because the demand for bank credit continues to be sluggish (non-food advances of scheduled commercial banks have expanded by a bare 4.4 per cent during 1993-94 so far compared to an increase of 19.2 per cent in the preceding year) the whole financial intermediation process has been severely distorted. The stage is truly set for inflationary spiral with no hope concurrently of any improvement in employment and real incomes for the comman man.

RESOURCE TRANSFER TO STATES

Playing to the Gallery

IT cannot go unnoticed that as against the total resource transfer to the states of Rs 53,817 crore in 1993-94 (revised estimates) the amount provided in the central budget for 1994-95 is only Rs 53,303 crore. Obviously, resource transfer to the states, even in absolute amount, will be smaller by Rs 514 crore. But that is not the whole story.

As a proportion of gross domestic product at current prices, centre-states resource transfer in 1993-94 would work out to 7.7 per cent. Assuming that growth in GDP in 1994-95 will be around 13 per cent without adjustment for the inflation factor, resource transfer to the states as provided in the budget will work out to 6.7 per cent of GDP. This implies a decline in the states' share by as much as 13 per cent. This decline, it is noteworthy, will take place in spite of the assumed increase of Rs 2,150 crore in the states' statutory share of central tax revenues. Whether this increase will actually materialise is questionable, based as it is on very shaky assumptions in regard to the realisation of revenues from the shareable taxes. These are the same taxes in respect of which the finance minister has been most generous with concessions and rate reductions—some in the name of rationalisation, as in the excise duty regime, and others to meet commitments already made, as for corporate and personal income tax. Partly at least, the purpose of the finance minister's optimism that the estimated loss in revenue entailed by his tax concessions and rate reductions will be made up by improved revenue realisation must have been not to cause too much unease in the states, and that too in a year when a Finance Commission is working on its award. His optimism is also perhaps based very much on hopes of a recovery in industrial growth materialising during 1994-95. Even assuming that the projected tax revenues under the shareable tax heads are realised, the statutory transfers in this form will work out to a smaller proportion of GDP in 1994-95 than in 1993-94.

But the largest part of the decline in total resource transfers will be in central grants and loans to the states. Here it is well to remember the sharp decline in recent years in the amount the states have been getting by way of their share of small savings collections. Small savings and receipts from personal income tax have one thing in common—the small share of the centre in the collections, so that the centre has very little to lose from a decline in them. The cost of the centre's generosity in regard to personal income tax falls very largely on the states and still the states have neither any say in decisions on these revenue sources nor any claim to compensation.

The decline in resource transfer as between 1993-94 and 1994-95 is accounted for more by grants than loans and interestingly the decline is shared evenly between assistance towards central and centrally-sponsored schemes. So when the finance minister claims to have increased the allocation for anti-poverty programmes, he conveniently omits to mention that this is at the expense of other central and centrally-sponsored schemes—an accounting trick which helps him play to the gallery, even as overall resource transfer to the states, which the latter could use for the amelioration of the condition of the poor, is curtailed.

CORPORATE TAXATION

Gaping Holes

THE finance minister has always claimed the recommendations of the Chelliah Committee to be the basis of his attempted 'reform' of the tax system. The significantly selective departures from the committee's recommendations in his actual tax proposals, therefore, deserve notice.

In the case of personal income tax, for instance, the Chelliah Committee had desired that the tax should be based on the comprehensive income concept. Arguing that "structural adjustment should entail some serious adjustment in the lifestyle of the elite too", the committee had recommended that the existing provisions for taxation of perquisites should be tightened and employers should be taxed on benefits extended to employees which remain untaxed in the latter's hands. This was specifically recommended in the context of valuation of perquisites by way of rent-free accommodation, particularly the metropolitan cities.

But while personal income tax rat have been sharply reduced, the princip of comprehensiveness in the computing income has been scrupulously ignore What is more, there has been not a wo of explanation from the finance minist why he has chosen to depart from tl recommendations of the Chelliah Con mittee in this fashion.

The truncated implementation of tl Chelliah Committee's recommendations equally glaring in the case of corpora taxation. The committee had forceful argued that an essential concomitant the simplification of the tax system an reduction of tax rates was the eliminatio of all tax incentives and concessions, wit very few exceptions. The committee ha listed some of the fiscal concessions no available to the corporate sector; fc example, (i) 100 per cent deduction c donations for rural development program mes and programmes of natural resourc conservation or even for any "project o scheme for promoting the social an economic welfare or upliftment of th public"; (ii) deduction of 20 per cent o profits of newly-established industria undertakings for a period of eight year (iii) a similar 20 per cent deduction fo newly-established small-scale industria undertakings; and (iv) deduction of 30 pe cent of corporate profits for a period o 10 years after April 1991 for all newly se up industrial undertakings, hotels an cold storage plants and ships. Added t these, there is the five-year tax holiday fo units in the backward eastern states in troduced in the 1993-94 budget which ha been extended to cover backward district of all states in the 1994-95 budget. Beside these, there is also the liberal tax treatmen of entertainment and other such expense which, it is well known, are used t camouflage personal consumption.

The latest budget has introduced tw new provisions which will yield substantial tax saving for the corporate sector namely, reduction of the long-term capital gains tax rate from 40 per cent to 30 per cent and shortening of the holding period for units of the UTI from 36 months to 12 months to claim capital gains tax relief. Export profits, of course, continue to be completely exempt from corporate taxation, even as export profitability has been boosted by the depreciation of the rupee and a number of the other export incentive schemes, such as special import licences, duty exemption and concessional credit, continue. The Chelliah Committee had, once again, pointed to the need for rethinking on these measures once the indirect tax system on domestically produced goods had been rationalised.

The result has been that the incidence of corporate taxation has come down sharply over the years. According to the

RBI's study of company finances, the effective tax rate (tax provision to profit before tax ratio), came down from 39.2 per cent in 1988-89 to 36 per cent in 1989-90 and 32.4 per cent in 1990-91. For later years, the ICICI's study of the private corporate sector, covering 620 companies, shows that the effective tax rate came down from 30.2 per cent in 1991-92 to 24.8 per cent in 1992-93. As many as 189 companies in the ICICI sample were in the zero-tax category in 1992-93 and their number was expected to shoot up because of the reduction in corporate tax rates combined with the continuance of tax incentives and exemptions. It is no surprise, then, that corporate tax receipts as a percentage of GDP have shown no increase at all; in fact they have come down from around 1.4 per cent in the early 1980s to around 1.3 per cent in recent years.

If the corporate tax system is at all to be made more effective it is clear that, apart from pruning the multiple incentives and concessions and tightening tax treatment of certain types of expenses, it is absolutely necessary to introduce a minimum tax provision. The number of zero-tax paying companies is increasing alarmingly and a rough estimate suggests that if a minimum tax of 25 per cent were imposed on corporate profits, it would net not less than Rs 2,500 crore, which is as much as one- fifth of the total current collection from corporate taxation.

KASHMIR

Wrong Elements

A correspondent writes:

THE performance of their Pakistani patrons at the Geneva UN Human Rights Commission conference has put the Hizbul and other pro-Pak militant outfits in Kashmir in an awkward position. But they may continue to demonstrate their muscle power for some time with the help of a spurt of arms aid from Islamabad which, to compensate for its frustration in Geneva, is likely to increase the flow of arms in the coming months. As a result, we may soon see a few more killings in the valley—like that of the former assembly speaker, Wali Mohammad Ittoo—and threats of assassination directed against people like Farooq Abdullah. Such peevish gestures by the militants are a fall out from Pakistan's humiliation in Geneva.

But the fiasco over Kashmir in Geneva should open the eyes of those Kashmiri militants who had been seriously hoping to 'liberate' their homeland with the help of Pakistan. No liberation war anywhere has ever succeeded through the efforts of mercenaries or senseless terrorism—the two main features that mark the military strategy of many of the secessionist groups in Kashmir. The people of China, Vietnam and the African countries built up their own armies and fought wars to emancipate themselves from the yoke of oppression. If the Kashmiris feel that the Indian government is an alien oppressor that is colonising them, their leaders so far have failed to give shape to that feeling in the form of an all-round movement for independence that could have compelled the world to recognise it as a genuine case of self-determination. Instead, the increasing dependence on and identification with Pakistan has robbed the militants (even the pro-independence outfits like the JKLF) of the chance to convince world opinion of the validity of the Kashmiri cause. Taking advantage of their dependence on Pakistan, the Indian government has been able to convince a large number of states that the movement in Kashmir has no indigenous roots and is totally Pak-inspired. It is this again that has helped the Indian government to persuade them to cold-shoulder the issue of violation of human rights by the Indian security forces in Kashmir—an issue on which New Delhi needed to be ticked off at the Geneva conference. But the failure of the Kashmiri groups to pose their case as an independent issue and their reliance instead on the Pakistani delegates (who were out to grind their old axe and settle old scores with India) at the Geneva conference deprived them of the opportunity to voice their genuine grievances at a world forum and seek sympathy for their cause.

Meanwhile, in the valley, some of the militant groups have been frequently indulging in common crimes like abduction, rape, extortion of money, etc. As happened with the Khalistani secessionist movement in Punjab, once these elements from the anti-social underworld are allowed to take over, it is easier for the police to penetrate the movement through these elements and finish it off. In Kashmir, the militants' exclusive stress on terrorist actions easily allows the underworld as well as mercenaries from Afghan, Pakistani and other terrorist outfits funded by fundamentalist Islamic forces to enter the scene. This is likely to alienate those outside Kashmir who may otherwise be sympathetic to the cause of self-determination of the Kashmiri people.

UNEMPLOYMENT

Bias towards Underestimation

AS is well known, unemployment in the developed countries has been at rather high levels. In all the five most developed countries, also referred to as the G-5, unemployment rates are currently higher than ever in the past three decades. However, taking the formal figures of unemployment as such there are major inter-country differences. At one end is Japan with an unemployment rate of 2.7 per cent with the US following at a considerable distance with a rate of 6.4 per cent. At the other end are France and UK, with 12 per cent and 9.8 per cent respectively.

These formal rates do not, however, represent the correct picture of the level of unemployment in these countries. They do not convey the full extent of the problem of joblessness and the principal reason is, as has been pointed out in a recent issue of the *Amex Bank Review*, the failure to take into account the number of what have come to be called 'discouraged workers'. And this number, worked out on the basis of the procedure employed in two recent studies by the US Bureau of Labour Statistics, differs from country to country: "Many millions in the G-5 countries would like to work but are not actively looking for jobs, believing their chances of finding employment are low. Taking these 'discouraged workers' into account transforms cross-country comparisons, narrowing the dispersion between major industrialised countries but also suggests that the real scale of unemployment is much higher."

The adjustment with respect to 'discouraged workers' raises current unemployment rates for Japan and the US to 9.6 per cent and 9.3 per cent respectively and for France and UK to 13.7 per cent and 12.3 per cent respectively. Only for Germany is there no increase in the level of unemployment of 9.1 per cent. But this is not because the German figures take account of the phenomenon of 'discouraged workers', but because of lack of data on which to base an estimate of their numbers. The inter-country differences are still there, but they are not as large as when 'discouraged workers' had not been taken into account. The adjustment required for Japan, which is the largest, reflects a large drop in the labour force in times of slack employment, particularly in the female component of the labour force.

It is evident from the above that even in the developed countries, estimates of the level of unemployment and changes in it over time can go haywire. No less important is it to note that the bias is invariably towards underestimation of unemployment and that too largely because of failure to take into account those who would like to work, but are not actively looking for work, believing their chances of finding employment to be low. Finance minister Manmohan Singh needs to allow for this possibility before making claims of employment growth simply on the strength of employment exchange registrations, as he did in his budget speech

BURMA

Good Neighbours

Kamaroopi writes:

THE recent clarification by the Central Committee of the Kachin Independence Organisation (KIO) on the talks that the KIO has held with the State Law and Order Restoration Council (SLORC) regime in Burma confirms in its essentials what has been common knowledge for several months now.

The clarification, in the form of a letter to the *Far Eastern Economic Review* (March 10) only points out very minor inaccuracies of detail about the identity and rank of the personnel that took part in the talks without however disputing the material fact that such talks did take place. There have been further reports that the regime is now preparing to hold talks with other insurgent groups in the Karen, Kayah and Mon states as well. Gen Bo Mya, the president of the Karen National Union (KNU), whose armed wing has been leading the oldest of the insurgencies in Burma, is believed to have expressed the readiness of his organisation to hold talks with the regime. There have also been reports that the leaders of the Karenni National Progressive Party (KNPP) and the New Mon State Party (NMSP) have "begun talks with the central government". According to another report in the *Far Eastern Economic Review* (January 27) the Mons were the first to "strike a deal" with the regime in December last; the Karennis met the regime's representatives in early January; and, "about the same time", there was a meeting between "Gen Bo Mya and Lt Col Thein Swe, the Burmese defence attache in Bangkok".

These breakthroughs with oppositionist elements within the country appear to have been accompanied by similar improvement of the regime's image in foreign lands as well, though the regime has not softened its stand towards domestic democratic opinion and its moving symbol, Aung San Suu Kyi, now in the fifth year of her detention. This development, especially the improvement of its relations with its immediate neighbours, is likely to adversely affect the 'accommodation' which two of these neighbours, India and Thailand, have provided, albeit rather grudgingly, to political dissidents, in particular to the almost totally resourceless Burmese student activists.

Though Thailand has a much larger number of these dissidents and is moreover the territory through which the older insurgencies and the post-1988 resistance have access to their headquarters within Burma, the country has also been able to exploit these very factors and maintain on the whole amiable relations both with the regime and with the insurgent and resistance groups. China, the other important big neighbour, has from the beginning adopted a most 'pragmatic' and characteristically unsentimental approach and has fully consolidated itself as an important economic force, a process considerably helped by the continued presence in Burma of a substantial overseas Chinese population dominating business and trade.

Such 'pragmatism' was lacking in India's immediate response to the army crackdown in Burma. However, in the last one year India has taken several initiatives to make up with the regime. The visit of the foreign secretary to Rangoon towards the end of March last year was preceded by a visit of the Indian ambassador in Burma to Tamu and Moreh on the Burma-India border by road—a rather unusual initiative which attracted little notice—to study the problem of cross-border trade and related issues. The numerous official and political exchanges that followed culminated in the recent agreements signed during the Burmese deputy foreign minister's visit to Delhi on border trade and on 'co-operation between respective border civilian authorities' with a view to controlling insurgency and drug traffic, the two contributing to and thriving on each other, with considerable assistance from the very authorities empowered to control them on both sides of the border. The fact that the union home secretary signed the MOU on behalf of India, in the presence of the minister of state for home affairs, is only one indication of the essentially political content of the agreements, going well beyond mere cross-border trade and smuggling.

Quite apart from the urgent need to control the insurgencies in the north-east, the breakthrough China has been able to make in its relations with Burma going far beyond its already established economic dominance appears to have influenced these Indian initiatives. A PTI report from Beijing dated May 31 last year said, quoting Xinhua news agency, that China had opened a 93 kilometre stretch of a highway built in 1929 but for long in disrepair, "from Yunan province to a Myanmarese port on the Irrawady river", thus providing easy access to China to the Indian ocean via Myanmar (*The Hindu*, July 1, 1993).

There have been further reports since then of China helping Burma to upgrade its naval facilities at Sittwe in Arakan and at Bassein in the Irrawady delta, including the building of a new naval base at Hainggyi in the estuary of the Irrawady near Bassein and of a naval radar station on the Coco islands just north of the Andamans. Not to be left behind, India too has offered its help in improving the Tamu-Kalemyo-Kalewa road.

With such competing pragmatisms at work, where does it leave the Burmese democratic opposition?

TWENTY YEARS AGO

***EPW*, April 6, 1974**

The new commandment, which supposedly will usher in socialism, is a purposive narrowing of the area of operation of the public distribution system.

It is a grand design in which—now that the evidence is out—the government in New Delhi has been an active, enthusiastic participant. Since procurement has lagged behind, and since it is nearly impossible to obtain grain from outside, the axe would fall on public distribution. The government might even quote the authority of the Agricultural Prices Commission in support of this solution. Some hints have already been thrown by the union agriculture minister as to the manner of curtailment of the public distribution system. The budget has lit the way to how, in the guise of furthering economic progress and social justice, the most regressive public policies could be made to pass muster.

The re-ordering of public distribution would conform to a familiar pattern. The government would start by shedding its responsibilities to supply foodgrains to people in the countryside and in the semi-rural fringes. Distribution under official auspices would be concentrated in the areas covered by statutory rationing, certain urban pockets, and the industrial belts. When food is short, these are the areas which pose the greatest threat to law and order. The authorities propose to purchase peace by ensuring uninterrupted lines of supplies to such areas. Beyond this, the government's liability would now be disowned. As for the unorganised masses in the rural areas—comprising mostly landless labourers and small farmers—the authorities have given notice that they are washing their hands of them.

The gross immorality implicit in the decision is passing almost unnoticed. This blatantly regressive decision has evoked only a feeble protest in parliament and outside. Even were the government's commitment to ameliorate the condition of the weaker sections not to be taken seriously, there remains the other fact—confirmed dramatically by the results of the recent polls in Uttar Pradesh and Orissa—that the Congress Party's grass roots support largely stems from the poorer people in the countryside and in the backward regions. The pretension till last year, that the urban, upper-class bias in the public distribution system was to be redressed through opening new fair-price outlets in rural areas, is now being abandoned, and the poor are being ditched. They have fulfilled their duty, by and large, by voting for the Congress; the rest is going to be silence.

Shaba Chemicals

SHABA CHEMICALS, incorporated in December 1986, is engaged in the manufacture of trimethoprim and tinidazole (both bulk drugs) since 1988. The company now plans to expand its production capacity for trimethoprim from the existing 36 mt to 236 mt per annum at a total cost of Rs 2.7 crore. To part finance the expansion project the company plans to enter the capital market with a public issue of equity shares at par aggregating Rs 2 crore. In addition to exporting trimethoprim through leading merchant exporters for the last three years the company has also entered into a memorandum of understanding with Chemphar, Hong Kong for the export of 50 per cent of its output for the next three years. The recent announcement of reduction of customs duty from 85 per cent to 65 per cent on the company's major raw material is expected to improve its profitability further.

Neo Intex Mills

Neo Intex Mills, a company incorporated in 1990 and engaged in the manufacture of cotton yarn, initially set up production facility with three OE machines (imported from Germany), one blow room line with 10 cards and one draw frame. The facility was set up at a total cost of Rs 3 crore and was financed by the promoters and with term loans from banks. Commercial production commenced from March 1992. With the government's decision to allow import of second-hand textile machines, the company now plans to undertake phase II of its project which envisages the installing five OE machines, one blow room line, 16 cards, six draw frames, two carding machines and two draw frames. The second phase which is to cost Rs 4 crore has already been partly completed and the last stage of installation of the balance machinery and utilities is expected to be completed by June 1994. To part finance the project the company is entering the capital market with a public issue of 30,00,000 equity shares of Rs 10 each at par. The issue will be lead managed by Integrated Advisory Services.

Nagarjuna Jiyo Marines

Nagarjuna Jiyo Marines was incorporated in May 1992 with the sole objective of setting up a shrimp processing facility comprising processing halls, cold storage and freezers. The project is to be set up at Vizag at a total outlay of Rs 3.7 crore and is to be part financed through a public issue of 27,00,000 equity shares of Rs 10 each at par. The issue, which will open for subscription shortly, will be lead managed by Integrated Advisory Services, Madras. The company proposes to procure, grade, clean, process, pack, freeze and export high quality shrimps under the Individually Quick Frozen (IQF) process. In addition to the natural advantage which India enjoys in the form of a long sea-coast with a tropical climate which is ideal for breeding shrimp, the government has already come out with an integrated aquaculture policy to ensure sufficient and regular supply of high quality shrimps.

Pratappur Sugar

Pratappur Sugar and Industries (PSIL), an existing sugar mill, is approaching the investors for the first time with 12 lakh ordinary shares of Rs 10 each at a premium of Rs 15 per share. Out of this 9.6 lakh shares are offered to the Indian public and the rest reserved for mutual funds and financial institutions. Unlike the several sick sugar mills in Uttar Pradesh, this is a profit-making mill planning to take over two sick mills in the state. The average capacity utilisation of the mill is over 100 per cent and the sale recorded for the year ended August 31, 1993 was Rs 21.32 crore on which it earned a net profit of Rs 77 lakh. It is planning to diversify into manufacture of chemicals (using molasses) and co-generation of power from bagasse. It is also planning to sell surplus power to the UP grid during the off season. The project is being financed by equity capital, share premium and internal accruals. The issue will open on April 5.

Nepc-Micon

Nepc-Micon, a Madras-based company incorporated in 1989 and belonging to the Nepc group, is engaged in the manufacture of wind turbine generators and wind driven pumps. It reported a turnover of Rs 70 crore and a net profit of Rs 7.72 crore in 1992-93. The company, a pioneer in the field of wind energy, is diversifying into private air-taxi business. It has plans to purchase five Fokker F-27-500 aircraft and one King aircraft. The company will also procure two Boeing 737-200 and five other Fokkers on lease. The air-taxi project with a long-term working capital requirement is estimated to cost Rs 105 crore and is to be entirely financed by a right-cum-public issue of 35 lakh FCD of Rs 300 each. The company is entering the capital market on April 6. Of the 35 lakh zero interest FCDs, 16.20 lakh FCDs are being offered on rights basis (10 bonds for 100 equity shares) and 12.11 lakh FCDs are being offered to the Indian public. The FCDs will be converted into 10 equity shares of Rs 10 each at a premium of Rs 20 per share six months from the date of allotment. The issue is lead managed by Indian Overseas Bank and BOI Finance.

Sharat Sea Foods

Sharat Sea Foods, incorporated in 1991 at Nellore in Andhra Pradesh, began as a pilot project for brackish water prawn culture in 10 hectares of water-spread using indigenous technology. The company has today expanded with an additional 40 hectares and also acquired about 200 hectares of land to take advantage of economies of scale. The company has entered into a technical collaboration agreement with High Won Fisheries Development Corporation of Taiwan, a global leader in aquaculture, under which the collaborator will not only provide technical know-how but will also buy back 100 per cent of the company's production. The company plans to tap the capital market on April 4 with a public issue aggregating Rs 10 crore. The issue is to part finance the company's ongoing expansion programme which entails the establishment of a hatchery with an annual capacity of 200 million seeds, a feed mill with a capacity of 9,600 tpa and a processing plant capable of handling 3,000 tpa.

Dynachem Pharma

Dynachem Pharmaceuticals is setting up a project to manufacture micro crystalline cellulose, an import substitute product which is to be manufactured from dry bagasse obtained from sugar mills. The project which is to have an installed capacity of 600 tpa is being set up at Ahmedabad in Gujarat at a total cost of Rs 11.8 crore. At present micro crystalline cellulose is being imported by all the well known domestic pharmaceutical companies. The project is in an advanced stage of completion and the company expects to commence trial production from July this year and commercial production soon thereafter. To part finance the project the company plans to enter the capital market on April 21 with a public issue of 81,90,000 equity shares of Rs 10 each at par.

CURRENT STATISTICS

EPW Research Foundation

While exports in dollar terms have risen by 21.4 per cent in 1993-94 (up to January), imports have remained almost stagnant. Structurally there are signs of exports moving in favour of agriculture and raw material-based products and against manufactures and capital goods. In imports there is a relative shift towards capital goods. Inflation has begun to accelerate with prices of agricultural raw materials and commodities of common consumption galloping. Broad money, in particular reserve money, growth has also accelerated. Foreign exchange reserves have touched $ 14.4 billion

MORARJEE GOCULDAS

Poor Showing in Textiles

INCORPORATED in 1871, Morarjee Goculdas Spinning and Weaving Company (MGSWC), the flagship company of the Piramal group, has interests in textiles, tools and auto ancillaries and has several units in Bombay, Davangere and Gadag, Ankleshwar and Satara.

For 1992-93, though net sales increased by 14 per cent over the previous year, low production coupled with higher operating expenses led to pressure on margins with operating profit showing a mere 1.7 per cent rise. High interest charges despite lower recourse to term loans by the company and a sharp increase in depreciation charge further aggravated the company's woes and despite a zero tax provision (for the third year in succession) the company suffered a 47.5 per cent dip in net profits over 1991-92. The fall in term loans and the rights issue made to part finance the modernisation of the company's textile division led to a lower debt-equity ratio. Despite the drastic fall in net profit, the company maintained dividend at 20 per cent entailing a higher dividend outgo

A weakening demand for textile products coupled with rising cotton prices led to a poor performance by the company's textile division at Bombay. The turning around of the newly merged Davangere Cotton Mills provided little consolation and production of cloth (sale of which constituted up to 70 per cent of the company's turnover) was stagnant at 762.4 lakh mtrs (761 lakh mtrs). Production of yarn (which contributed up to 13 per cent of turnover) however was higher at 41.5 lakh kgs (33.6 lakh kgs). Sale of cloth rose to 774 lakh mtrs (725 lakh mtrs) while that of yarn was higher at 43 lakh kgs (33.4 lakh kgs) in 1992-93. The recessionary trends in the engineering and domestic automobile industries also affected the performance of these two divisions in 1992-93.

For the current year 1993-94, the company expects the completion of modernisation of the Bombay operations and installation of state-of-the-art machinery and the turning around of the Davangere and Gadag unit to contribute significantly to higher production and sales. The reduction in import duties is also expected to improve the margins of the tools and auto ancillary units of the company. The company entered into a technical collaboration agreement with Fico Transpar S A, Spain—the well known Spanish industrial group which specialises in automotive ancillaries—for the manufacture of wind-shield washer pump assembly. Production of this import substitute product was expected to commence in January 1994. To promote its products in the international market, provide on-the-spot services to the overseas customers and identify new business opportunities, the company has set up a liaison office at Stuttgart, Germany and plans to upgrade the office into a trading branch.

For the six months ended December 1993 MGSWC earned a net profit of Rs 8.6 crore on net sales of Rs 158 crore giving annualised earnings per share of Rs 11 for 1993-94 on equity of Rs 15.6 crore.

J B CHEMICALS

Diversification

A 15-year old company belonging to the Unique group, J B Chemicals has transformed its slack performance of 1991-92 to one of buoyancy in 1992-93. While net sales rose by 12.3 per cent, comparatively lower increases in manufacturing expenses and remuneration to employees as also interest caused operating profit and gross profit to spurt by 9.2 per cent and 22.9 per cent, respectively. And in spite of making higher provision for depreciation and taxation, profit after tax has gone up by 22.2 per cent. The burgeoning reserves have enabled the company to issue bonus shares in the ratio of 1:2.

During the year, except for capsules and ampoules, production of tablets, liquids and cartridges increased while that of bulk drugs remained more or less steady. Recently, the company widened its product range by adding the Nicardia range of drugs for treatment of angina, hypertension, etc. Besides bulk drugs and tablets, J B Chemicals also manufactures certain raw materials like glyokal which is a basic raw material for metronidazole, and other raw materials for captive consumption like metronidazolebenzoate and dielofenac diethylamine salt which are used for various pharmaceutical formulations.

With a view to increasing its presence in the market, the company is setting up two formulations plants—one to manufacture liquids and ointments at Panoli at an estimated cost of Rs 3 crore and the other to manufacture tablets and capsules at Daman at a cost of Rs 1.5 crore. It is also expanding its metronidazole plant and diclofenac sodium plant at Ankleshwar to increase capacity.

However, since most of the company's products fall under the government's controlled-price list, with a view to offsetting any possible adverse implications arising from the government's policies it has diversified into other pharmaceutical preparations. While an in-house R and D facility has been set up for manufacturing ayurvedic medicines, J B Chemicals has installed a plant for making soft gelatin capsules at Panoli in Gujarat. The company has also acquired an agro-based manufacturing unit, MCDA Agro, as its subsidiary. MCDA produces environment-friendly and non-toxic products like crop boosters and neem-based crop protectors which are reportedly in use in only 5 per cent of the cultivated area. As such, there is a good untapped market for the company's products.

The company claims that its research and development work has not only enabled it to bring its operations on par with international standards, but has also brought about increase in productivity and better utilisation of energy.

For the first half of the current financial year, J B Chemicals has reported 19 per cent growth in sales at Rs 45.2 crore with profit after tax going up by 46 per cent to Rs 4.9 crore.

DEEPAK NITRITE

Upgrading Technology

Despite a 51 per cent increase in net sales and zero tax provision, Deepak Nitrite failed to prop up its profitability during 1992-93 owing to steep rises in manufacturing expenses and interest burden. Profit after-tax declined by as much as 59 per cent and earning per share slipped to the single-digit figure of Rs 4.20 against Rs 10.30 posted last year. Exports posted a growth of 81 per cent, which was high, though lower than that in 1991-92. The exports-to-sales ratio was higher at 7.9 per cent compared with 6.6 per cent in the previous year. The increase in exports has been attributed primarily to increase in sales of its nitrite division.

With the performance of all the three divisions—nitrite, nitroaromatics and Sahayadri Dyestuffs and Chemicals—improving and particularly that of sodium nitrite/nitrate increasing by 12 per cent, the company is pursuing its strategy of improving competitiveness by adopting the latest technology, revamping and debottle-necking old plants, excelling quality norms of products and keeping costs under control. It is trying to increase both domestic sales and exports of its nitroaromatics division by concentrating on value added products.

At the same time, the company's research and development centres located at Pune and Baroda are developing downstream prod-

ucts from nitroaromatics. Research on biotechnological solutions for improvement in effluent quality have been successfully achieved for use in the dyestuffs division.

During the first half of 1993-94, Deepak Nitrite has posted sales of Rs 44.4 crore with net profit of Rs 0.8 crore

SHREE CEMENT

Lower Profit

The reduced offtake by government departments which normally constitute 40 to 45 per cent of total demand and the rising cost of critical inputs like coal, power, railway freight, etc, have adversely affected the performance of the cement manufacturing units in the country, Shree Cement (SCL) being no exception. The general recessionary trends in the economy and the downward trend in cement prices put pressure on the company's margins. After a satisfactory performance in 1991 92 when total income increased by 7 per cent and net profit rose by 18.4 per cent, the company's profitability fell drastically in 1992-93 with total income declining by 1.7 per cent and net profit hy a phenomenal 72 per cent over the previous year. This was despite a 4.4 per cent rise in cement produced from 7,64,416 mt in 1991-92 to 7,98,064 mt in 1992-93 and a 7.3 per cent increase in sale from 7,52,764 mt to 8,07,450 mt. In addition to a sharp rise in operating expenses, the interest charge was higher by 15.3 per cent and net profit margin fell from 13.6 per cent in 1991-92 to 3.7 per cent in 1992-93. Despite the fall in profitability and the rise in paid-up equity capital (following the issue of 36,00,000 equity shares of Rs 10 each at a premium of Rs 25 per share to FLT, UK, a subsidiary of F L Smidth and Co, Copenhagen, Denmark) the company maintained the dividend rate at 12.5 per cent.

SCL'S R and D efforts have reportedly resulted in saving in fuel consumption, further improvement of quality of cement, improvement in kiln operations and better use of marginal grade limestone. The company has received approval from financial institutions for the merger of Shree Leasing and Industrial Finance Company. The merger is expected to strengthen the business activities of the company. With the foreign and Indian technical experts submitting their findings on the potentiality of increasing the cement plant capacity, the implementation of the proposal for upgrading plant capacity is expected to commence in the current year.

For the first half of the current year (1993-94) SCL's profitability seems to have fallen further. While net sales were marginally higher at Rs 71.9 core as against Rs 68.6 crore in the corresponding period last year, net profit has fallen from Rs 4.7 crore to Rs 3.4 crore.

MAHARASHTRA SCOOTERS

Steady Growth

Maharashtra Scooters has been promoted jointly by Western Maharashtra Development Corporation (WMDC), a wholly-owned company of the government of Maharashtra, and Bajaj Auto. The company has technical collaboration agreements with Bajaj Auto for the manufacture of 'Priya' and 'Bajaj-Super' range of scooters and also commenced manufacture of 'Bajaj-Chetak' scooters at its works in Satara in 1992-93. The company's total income and operating profit have grown by a compounded rate of 14.8 per cent and 10.5 per cent annually, respectively, over the last four years. It has declared three bonus issues in the last 11 years at regular intervals and 82.5 per cent of the paid-up equity constitutes bonus equity. The company's current book value stands at a hefty Rs 114.

For the year 1992-93 while the company produced 1,01,048 scooters (96,265 scooters), a rise of 5 per cent over the previous year, net sales rose by 15.8 per cent and operating profit increased by 10.2 per cent over that in 1992-93. A sharp rise in interest charges from Rs 7 lakh in 1991-92 to Rs 2.8 crore in 1992-93 led to a 1.2 per cent fall in gross profit. A 1.2 per cent fall in depreciation charge coupled with a 5.1 per cent lower tax provision enabled the company to post a 2.9 per cent higher net profit for the year. It has maintained dividend at 25 per cent and consistent with its policy in the past has retained up to 86 per cent of profit after tax. Despite the rise in net profit, profitability has fallen over the previous year. During the year under review the company, which enjoys a very low debt-equity ratio, repaid its short-term loans completely. Further with the company depreciating up to 53.8 per cent of its gross fixed assets by 1992-93, turnover ratio improved from 75.8 per cent to 82 per cent.

In tandem with its efforts to bring down the consumption of power, fuel, oil and other energy sources, the company plans to introduce low temperature paint baking systems. The effluent treatment plant which was upgraded by installing a tertiary treatment plant for the treatment of water from secondary clarifier has reportedly resulted in savings in fresh water consumption as the treated water is recycled for processing operations.

For the first half of the current year the two and three-wheeler segment of the automobile industry has shown some improvement. The company's net profit improved only marginally from Rs 6.1 crore in the corresponding period last year to Rs 6.2 crore though net sales rose by over 20 per cent from Rs 63.8 crore to Rs 76.7 crore.

NEW DELHI

Behind the PM's 'Middle Path'

BM

Narasimha Rao's talk of pursuing a 'middle path' in economic policies amounts really to assuring entrenched vested interests that the status quo will not be disturbed.

A LARGER than life image of the prime minister has been sought to be built up by the media in recent months, especially after the assembly elections in the four northern states. The results of the elections were projected as the rehabilitation of the prime minister as a secular force and the confirmation of his commanding position in the Congress Party. The latest in this PR campaign is the attempt to invest Narasimha Rao with extraordinary philosophical wisdom. This discovery has been made especially during his frequent foreign excursions. His talk of a 'middle path' for India's socio-economic development at Davos was supposed to have impressed the hard-boiled executives of transnational corporations. His Guildhall speech in London has been hailed as 'brilliant' for his description of India's economic reform programme as something akin to the building of a pyramid, "going up, little by little".

If Narasimha Rao started the talk of a middle path for India supposedly to assert the indigenous character of the economic reforms being implemented and to deny that the programme had been framed by foreign agencies and accepted by his government the notion of the economic pyramid going up in India was applauded in London, especially by NRIs. "We don't want to distinguish between the top, middle and bottom" of the social pyramid in India, the prime minister is reported to have declared to the delight of his listeners. Elaborating further, he said that the government of India would take care of the bottom as no multinational corporation was going to do that; for the rest, the building of the pyramid was to be left to private initiative, Indian big industry together with the multinational corporations. This was the pattern the government had accepted. Narasimha Rao was "sure" that things would work "because no one is going to be hurt" by this approach which was in tune with "our heritage".

What all this really added up to was an assertion on behalf of the entrenched vested interests in India and abroad of the merits of status quo. It is certainly not the first time that India's social pyramid has been applauded even as efforts have been made to sustain it, especially when the demands and strivings of the deprived and exploited at the bottom for fair play and justice have tended to gain strength and rock the economic, social and political stability of the system. The anxiety of the political representatives of vested interests in such situations is to try to paper over the cracks in the pyramid. While making appeals for 'common sense' acceptance of the established economic and social order, they have to give some attention to the maintenance of the base but without in any way hurting the middle and the top. The economic policy of the government headed by Narasimha Rao is designed precisely for this purpose. But, in spite of much effort and skill and the foreign help that has been made available, the old cracks in the pyramid have become more and more visible and new ones have continuously appeared.

The political-administrative set-up, therefore, increasingly has to resort to subterfuges, obfuscation and to penal measures to enforce law and order and stability. The rhetoric of the prime minister in support of the 'pyramid' reflects this position. It also reflects the growing desperation of the ruling elite since appeals to interested quarters abroad for a wider and stronger 'safety net' for the preservation of the pyramid have not evoked the kind of response hoped for. On the contrary, the terms and conditionalities attached by foreign interests to their assistance, in the form of financial flows, capital investment and technological inputs, especially by the multinational corporations, have become stiffer in the last two-and-half years. The latest in this direction is the demand for special treaties on a bilateral basis to guarantee the security of and high returns on foreign investment, in addition to the guarantees given and obligations accepted under multilateral arrangements as well as the deals agreed to with particular foreign business firms and other investment agencies.

The pyramid theory and the policy commitment not to distinguish between the top, middle and bottom and to preserve the pyramid without hurting any one even as the conflict of interests in the economic and social structure grow and sharpen are, therefore, important and significant. This goes way beyond even the discredited trickle-down theory of yore. The effort to keep intact the bottom for the growing top and the middle to rest on it without its cracking is bound to be difficult. Since the domestic base of those who have taken on this job is becoming narrow and fragile, they have to make efforts to find understanding and support from foreign quarters. The upshot is that in the course of implementation of the economic reforms programme the government has been pushed steadily into the neo-colonial mould.

The visit of Robin Raphel has dramatised this position very well. The red carpet laid out, specifically on the directions of the prime minister, for her and the 'frank' talks she has had in New Delhi are significant. Noteworthy too is the way in which the media, by and large, could be managed to fall in line. Before Raphel's visit the impression was, sought to be given that since the US administration had stepped up its pressure on India to fall in line on such sensitive issue as Kashmir and the NPT, the Indian response too had stiffened. But the anti-climax came as soon as Raphel landed in Delhi.

Developments in India's economic policies during the 80s, the full implications of which are unfolding in the 90s, are of great relevance in this context. The notion the ruling elite in India had begun to entertain in the 80s was that, having achieved what began to be described as the mid-stage in its economic development, mass poverty notwithstanding, India should distance itself from the G7 and forge closer relations with the developed countries, the US above all. Third world solidarity and south-south co-operation ceased to be priority considerations in the government's foreign policy. This was the starting point of what Narasimha Rao has characterised during his foreign trips as "reorientation" of India's socio-economic development strategy.

The flaunting of the banner of a medium-level developing country and the hankering after a regional power status have, however, not helped the search of the ruling elite for crumbs in the world order and to assert a position of eminence in south Asia, in particular with respect to Pakistan. The notion that once India goes

through an economic reform programme as laid down for it by G7, it will enjoy the benevolent political-strategic support of the US and the G7 as a regional power has proved to be fanciful.

The euphoria over the assembly election results will soon disappear, especially in the face of mounting popular unrest and the efforts of the opposition parties to capitalise on it. The realignment of political forces now taking place in the country has been of a far-reaching nature and may well upset the designs of G7, in particular the US. India's independent socio-economic development and its foreign policy stances as originally conceived were closely interrelated. Its political integrity and sovereignty cannot be safeguarded if the path of self-reliant socio-economic development is not vigorously pursued. There is, of course, a thin upper crust of comprador business interests who are keen to partake gains of opening up the economy for exploitation by multinational corporations. There are also hangers of these vested interests and cosmopolitan intellectuals who believe that since India has a large market for multinationals to sell to it will ultimately win some benevolence from the other side. These avid sellers of the Indian market have now gone gaga over 'friends in high places' in US—the 22 American multinational corporations which have formed a so-called Indian Interest Group. Narasimha Rao is a hero to such disoriented individuals and groups. It has, for instance, been suggested widely, that Rao directed the reception of Raphel to be warm because he had at last received or was likely soon to receive president Clinton's personal invitation to visit Washington. Evidently he considers a visit to Washington to be received by Clinton as something so important that he would not do anything to jeopardise it.

Sardar Sarovar: Case for Lowering Dam Height

Vinod Raina

If lowering the height of the Sardar Sarovar dam will drastically bring down the area to be submerged and the number of people to be displaced, there is every reason to give the proposal serious and urgent consideration.

A NARROW chink seems to have been opened for a more rational resolution to the Sardar Sarovar controversy than was hitherto possible. The initiative of the Madhya Pradesh chief minister, Digvijay Singh, by asking for the lowering of the Sardar Sarovar Dam (SSD) height from 455 ft by 19 ft to 436 ft opens up many possibilities. It is important to note that by making such a demand, Madhya Pradesh has in fact opted for reduced power from the project, along with reduced submergence of its area, because the extra 19 ft have more to do with power generation rather than with water distribution. However, as will be argued here, the better solution would be to opt for a dam height of under 400 ft, which will reduce the displacement by about 80 per cent while ensuring that there is no decrease in the stipulated water supply to Gujarat.

As is well known, a Narmada Water Disputes Tribunal had to be set up to resolve the inter-state dispute regarding water sharing from Narmada. In its award of 1979, the Tribunal allocated 9 million acre feet (MAF) of water to Gujarat, 0.5 MAF to Rajasthan, 0.25 MAF to Maharashtra and making an allowance of a loss of 0.5 MAF due to evaporation, it recommended a dam height of 455 ft to make a total of 10.25 MAF of water available from Sardar Sarovar. This meant that as far as Sardar Sarovar is concerned, Madhya Pradesh does not get a single drop of water from the project, even though the submergence of its area is maximum; 193 villages compared to 19 villages in Gujarat and 33 in Maharashtra.

How was the height of the dam fixed? First of all, on geographical and other considerations it was decided that the full supply level, or the height of the main canal in Gujarat would be 300 ft. Which implies that to feed this canal by gravity, the dam height must be above 300 ft. A minimum draw down level (MDDL) of 307 ft implies that the dead storage of the reservoir must be 1.68 MAF. It was also assumed, that for a 100-year life span of the reservoir, a provision of 0.3 MAF should be kept for siltation, on the basis of a siltation rate that has now been seriously questioned. To deliver 9 MAF of water to Gujarat through the main canal, 1.39 MAF of live storage, over and above the dead and siltation storage was deemed necessary. It is the practice to keep provision for a carryover capacity in such reservoirs so that if there is a bad monsoon, there is a carried over volume of water from the previous year to compensate for the decrease. Surprisingly, a fantastic carry-over capacity of 2.81 MAF was envisaged for the reservoir, over and above the previous provisions. All this adds up to a reservoir capacity of 6.18 MAF, with 4.2 MAF of live storage capacity, for which a height of 436 ft was found to be necessary.

The extra 19 ft were added purely for the purposes of generation of electricity. The MDDL for the purpose of generating electricity was fixed at 363 ft, thereby increasing the dead storage to 2.94 MAF. The live storage capacity was fixed at 4.73 MAF, requiring a height of 453 ft. Unbelievably, merely in order to look better, this figure was rounded up to 455 ft, without any thought that these extra 2 ft would mean a further submergence of 3,000 acres of land in MP, of which 1,000 acres is prime cultivated land. This therefore is the basis for the stipulated dam height of 455 ft.

The only benefit offered to Madhya Pradesh from the project was power. The project includes a river bed power house (RBPH) with an installed capacity of 1,200 MW, with declining generation, and a 250 MW installed capacity canal head power house (CHPH). Madhya Pradesh is to get 56 per cent of the power generated from the project. It is significant that in his letter to the prime minister, the Madhya Pradesh chief minister, Digvijay Singh, while recommending a height reduction to 436 ft, has accepted to forego the share of power, that will consequently be reduced. In any case, as the energy scientist Amulya Reddy has pointed out, there is very little sense in the power generation component of the SSP, the

power benefits are, to say the least, very dubious. The firm power generated by the river bed power house would reduce from 401 MW in 2000 AD to nil by 2024 AD as the upper river projects are completed. All that will be left by 2024 AD is 110 MW of firm power from the canal head power house with an option to run the river bed power house by using power from other sources to pump water to it from the Gurudeshwar Weir. Digvijay Singh's option for a height of 436 ft would, therefore, seem to be justified as the power component is very unattractive, as also because this height finds mention in the Tribunal Award for purposes of water sharing.

The critical factor in determining the height of 436 ft is the lavish carry-over capacity of 2.81 MAF, and for the 455 ft height, the MDDL of 363 ft. If the height reduction to 436 be accepted as justified, the MDDL of 363 ft no longer has any merit. The crucial and determining factor for working out a proper height, within the ambit of the Tribunal Award, would be to ensure 9 MAF water to Gujarat. As should be clear from the foregoing arguments, such a flow will be ensured by a reservoir with a live storage of 1.39 MAF, with a component of carry-over capacity, and a MDDL above 300 ft to ensure gravity flow in the main canal. These requirements are more than adequately met by a dam height of 400 ft with a MDDL of 317 ft. The live storage capacity of the reservoir created by such a dam would be 2.33 MAF ensuring an adequate carry-over capacity of nearly 1 MAF. The submergence would be reduced by more than half and if desired, it could still generate power as the comparative table reveals.

The critical point to note from this comparison is that without affecting the Tribunal Award's stipulation regarding Gujarat's share of water and with the willingness of the MP government to accept a lower share of generated power, the submergence is less than half. In terms of displacement, the factor would be many times less, for it must be noted that the above submergence includes the normal river bed submergence up to full river capacity. Though that data is not available to the author, one can easily see its influence on net displacement. Let us assume that the river bed submergence without the dam is 10,000 acres. This would give net submergence at 455 ft as 81,500 acres and at 400 ft as 31,532 acres, which is nearly three times less. In terms of population displacement, it may be up to 80 per cent less than what it would be at 455 ft. Since the population to be displaced by the 455 ft dam is over 1,50,000 persons, this figure would reduce to around 30,000 persons, perhaps making the rehabilitation a possibility from the present impossible situation. One must however note with a great deal of anguish that even though the displacement would greatly reduce, the affected population would still be the tribals since their habitations are closest to the dam site.

Table

Factor	455 Feet	400 Feet
Submergence (acres)	91,500	41,523
MDDL (ft)	363	317
Live storage (MAF)	4.73	2.33
RBPH firm power (2,000 AD) (MW)	401	340
RBPH firm power (2010 AD) (MW)	167	141
RBPH firm power (2024 AD)	–	–
CHPH firm power (2010 AD) (MW)	98	49
CHPH firm power (2024 AD) (MW)	110	55

Other Factors

The foregoing arguments are compelling enough to warrant a reduced height of 400 ft. There are however other contributory factors which demand such a height reduction. At the time of giving its Award in 1979, the Tribunal assumed that the Narmada river carried 28 MAF of water, 23 MAF up to the proposed Narmada Sagar dam at Punasa in MP and 5 MAF between Narmada Sagar and Sardar Sarovar. The situation has considerably changed by now and much better data analysis now reveals that the water availability till Punasa is 21.8 MAF and between Punasa and Sardar Sarovar a mere 1.2 MAF. This raises serious questions about the viability of a reservoir with a live storage of 4.73 MAF at a dam height of 455 ft at the Sardar Sarovar site. It might lead to a dam which only sometimes reaches its full capacity, thus ensuring full displacement, but can deliver much less water, and particularly power, on a sustained basis. On the other hand the live storage of 2.33 MAF with a dam height of 400 ft would be adequately sustained at the reduced capacity of the river downstream from Punasa.

The other important factor pertains to the quantum of displacement. It is an open secret that a proper survey of the population to be displaced is yet not available, in spite of many deadlines. However, it has generally been assumed that submergence will occur in an area up to the height of 455 ft or near about. However, a resurvey available with the Narmada Valley Development Agency reveals that the backing-up effect of water will result in a much higher level during monsoons, particularly in the tributaries, as you go further upstream. Which means that the submergence level is not a horizontal line at 455 ft but has a continuously higher elevation as you go upstream from the dam. For example, the submergence level thus worked out at Maheshwar upstream in MP is 494 ft! Which implies that one other proposed benefit for MP of the SSP, the Maheshwar power generation plant, would actually be under monsoon submergence. But this also implies that the total displaced population would be much higher than expected presently since the back-up effect would affect the entire submergence zone. Though the submergence map available with the NVDA seems to have considered this fact, it cannot be believed to be final. For example, this map assumes that only the outskirts of Dharampuri town will be affected, but there is a strong possibility that the entire town of 40,000 population will need to be evacuated because of monsoon submergence. The implications of such an eventuality are stupendous.

It is to be assumed that such an effect would operate for the 400 ft dam too, but these are the kind of details that would need careful analysis before arriving at the best possible height. To that extent 400 ft is an indicative height. A detailed review might, for example, find a height of 388 ft to be adequate in terms of ensuring 9 MAF of water to Gujarat with minimum social, economic, environmental and human costs.

There seems to be an adequate case to suggest that a national consensus must ensure a comprehensive review and reformulation of the project now that a critical factor has entered the picture, namely, the rather bold initiative of the MP government to accept reduced power than was originally envisaged. Since most of the parameters are interconnected, only a comprehensive review can work out the entire set of reformulated design values and plans.

Since the issue involves the possible reduction of submergence by a staggering amount, without decreasing the stipulated water to Gujarat, illogical and bureaucratic excuses of the type raised by the former chairman of the NVDA, Sharad Jain, recently, to stick to the original height need to be severely criticised. The objection is not merely to his expertise—contrary to press reports he is a statistician rather than a water expert—it is more with such technically absurd assertions that if the water content in Narmada has gone down, then the dam height needs to be increased rather than decreased. With less water in the river, a higher dam would simply not fill up on a sustained basis. Gandhisagar dam on the Chambal is a classic example of such a miscalculation. Because of less water in Chambal than what the dam was designed for, the Gandhisagar reservoir has reportedly reached its full reservoir level just once in its 24-year history! Similarly to assert that the reversible turbines have already been ordered from Japan is a classic bureaucratic outcry. If the river bed power station will deliver reduced power only up to 2024 AD but cause a tremendous amount of displacement, and when the main power beneficiary, Madhya Pradesh, is prepared to settle for reduced power, the order for such turbines should simply be cancelled, even if it means a certain amount of payment. New design parameters can and must be worked out and new machinery ordered. The gain in social, human and economic costs by reduced submergence must counter any status quo arguments. There is an urgent need to bring in some reason and rationality in discussions about a project that is essentially in the sphere of science and technology, and its social impacts. And there are compelling technical reasons to suggest that the review process must begin for the reformulation of the project, using the height of 400 ft as, what we scientists say, the first approximation.

Use and Abuse of History

Geetha Gangadharan

An attempt to get the views of some historians, recently gathered in Mysore for the annual session of the Indian History Congress, on, inter alia, *the abuse of history and historians in the Ayodhya dispute.*

THE 54th session of the Indian History Congress held at Mysore recently afforded an opportunity to ascertain the views of India's leading historians on the Ayodhya issue. Senior historians from different parts of the country assembled here to discuss various issues. The conference went on under a few broad themes such as Ancient India, Medieval India, Modern India, Countries Other than India and Historical Archaeology, Epigraphy Numismatics and Archives.

The occasion was utilised by this writer to get the reactions of historians to some other issues of compelling importance. Among these are the relevance of the discipline of history, abuse of history and historians in the Ayodhya issue, textbook writing and the contribution of the Indian History Congress in these areas.

All the historians with one voice declared that the contribution of the Indian History Congress, since its inception, had been 'phenomenal'. Their contention was that if only the government had taken note of their pleas, resolutions and predictions, the recent history of India would not have taken this hopeless turn.

History, according to most participants, is a socially highly relevant discipline. It has the potential to act as a guide to the future. It will never be detrimental to the growth and development of the nation. They felt that knowledge of history is essential because we have to learn from our past mistakes and work for a better future.

R S Sharma clarified it further, "Our problems cannot be solved by history but it can throw light on the various dimensions of the problem." M G S Narayanan asserted, "As long as you don't believe in astrology for predicting the future of a society, the only way you can understand a society is by looking into its past history. But, history should not cloud our vision of the future."

The participants emphatically stated that the Indian History Congress tries to promote 'objective' or 'scientific' history based on the use of sources, solid evidence, etc.

Coming to the Ayodhya issue, the participants were unanimous in their view that had the government heeded their resolutions on the issue, the history of India today would have been different. Way back in 1986 this premier organisation of professional historians had resolved that Ayodhya should be declared a national monument. It is one of the last examples of Sherkey architecture, and a fine one at that. The IHC had resolved that no worship of any kind should be allowed there and the Archaeological Survey of India should maintain it. Asked about the protection of historical monuments in general in the country, the secretary of the Congress, Sreemali, said

> It is unfortunate that a country like ours which has such a long history and magnificent heritage, does not have any National Trust as such to protect our monuments and a large number of them are decaying and are left to all sorts of vandalism. The civic authorities have shown total callousness... The so-called Babri Masjid, I would say, has been lost forever. No promise of the prime minister is going to bring it back again. It is gone forever. History would record it as such

Shireen Moosvi of Aligarh Muslim University endorsed this viewpoint.

The historians asserted that we should really be concerned about our roots, but should not get obsessed with that. We should try to understand it and the process of understanding the past is a continuous process. It is a never-ending quest for the discovery of oneself, the people, the society, the land, etc. It was emphatically stated that in the process of 'understanding' the past, we should never 'invent' the past. They reiterated that politicians in this country have tried to misuse history, distort and in fact mythify it for their short-term gains. These politicians artificially create the 'masses' who then proceed to fight for their 'causes'.

Asked about the distortions in history with reference to Ayodhya, Jha of Delhi University had an interesting answer. He categorises these distortions into two groups. First is the distortion practised by British historians who would tirelessly say that Indian society had remained unchanged over a long period of time and Indians are barbarians, etc. This was motivated by a desire to perpetuate imperialism. He interpreted the available evidence purporting to show that Indians have remained backward. It was misinterpretation of the available information and facts to suit the British historians' convenience. But now we have a more dangerous kind of distortion. The VHP has not only misinterpreted the available evidence, but also 'manufactured' some. While we can fight the former distortion, the latter is impossible to fight because we do not have karsevaks at our command. About historians playing into the hands of politicians on the Ayodhya issue, the participants asserted that no historian worth his name had done so.

Misuse of electronic media was another important issue that came up. Jha felt that the 'Ramayan' serial had communalised the Indian mind to a very large extent and that was why the BJP emerged strong in the Hindi belt: "I myself personally and the IHC both had protested against it right in 1987 and we have been proved correct."

Coming to the textbook issue, this writer was told that the IHC has set up a committee for reviewing school textbooks. NCERT is also involved in that exercise. And the IHC has asked its executive committee members to monitor their own respective state textbooks. The Indian History Congress is also engaged at present in writing a comprehensive 'History of India' and a few volumes have already come out. M G S Narayanan asserted:

> India is not a nation, it is an assemblage of nationalities; each state has its own national identity. These regional polities should be allowed to grow into regional nationalities. There must be a genuinely federal constitution for common purposes, as they have in Europe. In fact, this is a lesson of history. India has never been under a single administration except in the British period and it is an imperial tradition. When the British empire was disintegrating, we all expected that individual national groups will have their autonomy. On the other hand, we took a retrograde step. In the name of federalism, we have established a unitary constitution detrimental to the well-being of the nation. It is responsible for all the conflicts and tension within the country today.

Hence he is re-writing Indian history as a history of different nationalities. With marginal exceptions, he felt, that all Indian histories have been imperial histories.

Asked about the rampant communalism in the country today, M G S Narayanan had a very thought-provoking answer:

> We have to recognise communalism as a fact of life in India today. We live as different communities. Marriage, diet and religionwise people have their different communal outlook. When they are living in communities, communalism is a natural expression of their lives. You cannot deny that. How to modify that should be our concern. But the first step is to recognise communalism.

Asked about the future of history, the historians were all optimistic. No doubt, difficult times are ahead for history as a discipline but it is only an interlude, the historians believe. The present turbulence has been created by a few disgruntled elements. "We can go wrong only for a moment; never too long." Shireen Moosvi felt that the latest election results have proved this. As a part of the heritage of a composite culture, the Indian ethos is congenial for the growth of tolerance of ideas. Unanimously they asserted that ours is a very old civilisation, not 100 or 200 years old, but many thousands of years old. "It has its own resilience", they say. Thus, on the whole, the historians seemed to be hopeful about the future of the nation, despite the present turmoil.

No doubt these historians and the Indian History Congress are both doing yeoman service for our understanding of history in the right perspective. Yet somewhere as a nation we seem to be going wrong, more often than not, in putting history to right use. We now have several kinds of histories and hitherto unknown heroes have come into existence through textbooks in various states.

Like any other creative force, history has enormous potential if used properly. But if misused, it can create havoc for the social fabric of the nation. We already know the result of the misuse of history.

On Casteism and Communalism in Uttar Pradesh

G K Lieten

Recent political developments in Uttar Pradesh have been characterised by two denunciatory concepts: casteism and communalism. Preliminary results of an attitudinal survey in Jaunpur district show that class-conscious voting in itself may politically result in caste polarisation. The simple characterisation of this polarisation as casteist may function as a shorthand for the condemnation and denunciation of a social stirring by the exploitative classes.

POLITICS in Uttar Pradesh has always been tagged on to simplistic explanatory models. Two concepts have been used to explain the developments which have taken place since the late 1980s and which culminated in the 1993 state assembly elections: casteism and communalism.

These issues have been taken care of as subsidiary points of interest in the course of a study of the panchayats and local democracy in three districts in the state. Some preliminary findings of an attitudinal study are presented here. They relate to the political manipulation of jati and religious denominations in the realm of politics.

The study relates to the northern area of Jaunpur district, 150 km south of Ayodhya. The 'opinion poll' was taken in the months preceding the November 1993 assembly elections. Apart from some factual information, opinions were solicited on two ranges: the priorities of development and the caste/religion imbroglio. For the opinion survey, a random selection was made of one-third of the panchayat members in one nyaya panchayat area in the Garwara assembly constituency, supplemented with a random selection of around 160 men and women in the villages of that area. Previously, in the monsoon and post-monsoon period of 1990, a comprehensive study of all panchayat members was conducted.

The 1989 assembly elections in the area had been won by Janata Dal (32.6 per cent), very closely followed by Congress (32.3 per cent), and then at a distance by the CPI (13.9 per cent) and by the BJP and BSP with around 6 per cent each. The figures are mirrored in the political allegiance of the panchayat members in 1990, which indicates that the massive desertion of the Congress had not yet begun, and that the political attraction and attractiveness of the BJP and the BSP had not yet started. The communists were still a force to reckon with, but collapsing leadership left its mainly kurmi and yadav supporters adrift. The next elections (in 1991) started the churning process which led to an ignominious collapse of the Congress, and the upward thrust of the BJP and the BSP.

In the middle of 1993, when the study was conducted, party re-alignment was still in a flux. The rupture of the different incarnations of the Janata Dal (led by Mulayam Singh, V P Singh and Chandrasekhar) had not been healed. Although the BSP had not yet made its mark in the area, it was clear that the new outfit, if in alliance with any of the Janata incarnations, was going to improve its clout considerably. More than half the sample at that stage had a distinct preference for the Janata Dal pariwar. In the elections a couple of months later (November 1993), the BSP attracted 36.9 per cent and V P Singh's Janata Dal 17.3 per cent of the electorate. The fortunes of the Congress, as the graph indicates, had been plummeting, and would plummet further until the party could secure not more than 5.5 per cent of the votes in the assembly elections. The ex-Congress electorate had clearly shifted its allegiance: the poor people towards the Janata Dal and the BSP, the rich people towards the BJP. The data in Table 1 illustrate this class/caste divide. There appears to be a perfect shift of upper caste and upper-class votes from Congress to BJP in the run-up to the elections.

Coming in the wake of the hindutva resurgence, widely publicised by Hindu organisations and media reports, and just preceding the assembly elections, which was predicted to bring into the open the anti-upper caste self-esteem of the lower castes, the purpose of the opinion survey was to gauge the undercurrent of secular versus religious and casteist sentiments. For this purpose, the respondents were invited to rate 10 statements in terms ranging from strong disapproval to strong approval. Similar statements were presented in different renderings, e g, in the positive clause later to be followed by the negative clause, so that the internal consistency could be checked.

Of the 220 respondents, only three forms had to be rejected for internal inconsistencies, and six persons were unwilling or unable to rate the statements. This may lead us to the first important conclusion, namely, the presence of a very high awareness and ideational commitment.

Caste and Class

There is no dearth of scholars, commentators and journalists who prefer to see Indian society, and UP society and politics in particular, in terms of caste. The 1993 election results has only reinforced that idea. To many secular observers, and to many progressive political organisations, the results came as a shock in the sense that they indicated a 'casteist' reflex. The gratifying disenthronement of the BJP was marred by the emergence of a new sphynx, namely, casteism as represented by the BSP and its helmsman, Kanshi Ram.

The indictment of UP politics as casteist politics would have had some validity if there was not a strong correlation between caste and class. If the correlation is strong, i e, if most SCs belong to the poorest households of agricultural labourers, sharecroppers and poor peasants, and if the brahmins and thakurs belong to the dominant households of rich peasants, traders, teachers, etc, then the inference of the voting pattern along caste lines may very well be that at stake is a class assertion rather than a caste assertion.

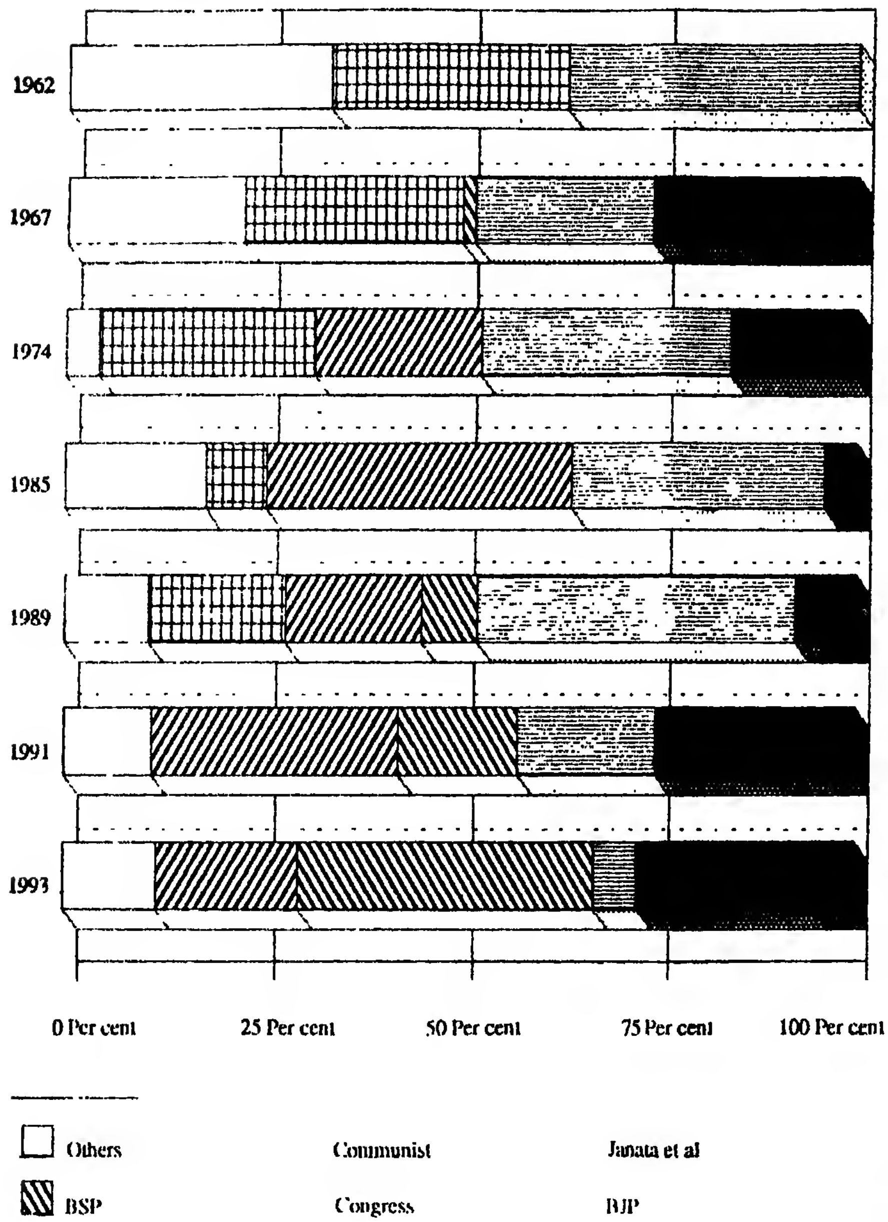
The conglomerate class position, as represented in Table 2 drives home the argument forcefully: at both extremes in the caste hierarchy, the correlation with class is almost perfect. Whereas only one brahmin belongs to poor households, practically all very rich families are of upper caste vintage. On the other hand, with two exceptions, the SC households can be classified as either poor or very poor. A wider sample would slightly blur the quasi-perfect correlation, but would not substantially alter the correlation.

Before proceeding further, we can therefore at this stage formulate the hypothesis that class-conscious voting (class in its mainstream sociological meaning) will politically result in caste polarisation. The simple characterisation of this polarisation as casteist may function as a shorthand for the condemnation and denunciation of a social stirring which exploitative classes may wish to denigrate and to crush. Hence the necessity to investigate whether the accusation of casteism holds.

Casteism in politics requires people to stand for elections on the basis of articulated appeals to caste as a way of garnering votes. In this definitional sense, elections in UP may have gone the casteist way. The public utterances of Kanshi Ram do suggest that he is bent on organising particular castes in order to wrench power from parties which in his public view are dominated by other castes.

Caste is ostensibly brought in as a bludgeon against political adversaries. In the

Figure: Assembly Elections, Garwara Constituency, 1962-1993



reading of Kanshi Ram and his sister-in-command, Mayawati, caste suppression is the work of all other political parties. Janata Dal and the Communist Parties also are 'Manuvadi' parties, i e, parties and leaders responsible for continuing to impose the caste system as invented by Manu, the brahmin (see *Frontline*, March 11, 1994: 11). The refusal to go in for an alliance with the Janata Dal had to be defended because of its Manuvadi lineage and because of the thakur character of its main leader, forgetting all the OBC-Harijan-Muslim leaders, and not because of its real motive: power. Kanshi Ram made this power enigma explicit in an interview (*Sunday*, December 5, 1993: 39): "I hate the JD and regard V P Singh as the greatest enemy of the dalits. In fact, even if it came to a choice between the JD and the BJP, I would prefer the latter. If I had agreed to such a political pact, V P Singh would have been unnecessarily occupying the centrestage at this point."

The message of Kanshi Ram, in his ostensible quest for power, is clearly casteist and continues a trend which has emerged during the colonial period, and has had some temporary successes in a few number of states.

Political casteism in addition, however, also requires the voters to collect behind parties and symbols on the basis of caste identification, and in the belief that they have to ally themselves as members of (an alliance of) castes against other castes. It requires the electorate to symbolise and to comprehend the divisions in society in terms of the caste order. This apparently is not yet the case.

Our findings indeed belie the widespread opinion that the casteist thinking of the lower castes in Uttar Pradesh has ultimately come into the open. They do react negatively to the suggestion that politics should be 'kaum' politics or 'varna' politics (see Statement 1).

The score of all SC respondents, on the scale from 1 (strongly disagree) to 5 (strongly agree), shows an average of 1.7, which indicate that they generally strongly disagree with the position that political parties should be based on caste.

The score frequencies indeed do suggest that only a handful of SC and OBC respondents want politics to be based on caste: out of 51 SC respondents and 77 OBC respondents, only six persons of each group agree or strongly agree with the position that parties should become caste based. The logic of this occasional respondent is simple: since all other political parties were dominated by the upper castes and, solely or mainly, have been looking after the interests of the very same upper castes, the lower castes have to start relying on their own organisations. Instances to shore the argument do not derive from national politics, but from the local inhibitive control by the upper castes. Even in the gram sabha where the brahmins and thakurs have only a scant minority, they manage to obstruct initiatives taken by the panchayat.

Empowerment of the hitherto poor and helpless requires the emergence of a new political formation. The new Messiah happens to be Kanshi Ram, but an electoral shift towards his party need not entail a casteist approach: of the 128 SC/OBC respondents, as many as 116 rejected casteist organisations in politics, most of them categorically. It is interesting to note that by and large similar scores are obtained if the socio-economic position is used as the denominator: the score is 1.8 for the very poor respondents and 1.3 for the poor respondents. On the other hand, the scores of the rich and very rich respondents add up to 1.1.

Empowerment

Empowerment expectations have been simmering for many decades. Political parties have failed to accompany this process and give it a non-casteist leadership. The CPI had done so at one time, but its organisation disintegrated. Indira Gandhi's

message of land reforms and justice then tied the lower caste/class people to the Congress. V P Singh was the next Messiah, not on account of the Mandal Report (most SC/OBC respondents do not set great store by the reservation policy) but on account of his direct empowerment appeal to the downtrodden. He received the deathblow from the bickerings and phony alliances within his party. Since the BJP from the very onset was perceived as a party of 'babhanlok' and 'Lalaji's' (brahmins and traders), it failed to reach the downtrodden villagers.

The simmering has now burst into the open. The general conclusion is that the changes in the UP political landscape reflect a class assertion. The leaders left in the field to ride on this class assertion are Mulayam and Kanshi Ram, and their local strongmen and organisers who have taken up the cudgels against alleged oppression and exploitation. These leaders themselves usually are not the direct victims of oppression and exploitation. On the contrary, they often occupy a privileged position. The short cut to leadership accordingly has to draw on caste solidarity rather than class solidarity. The purpose is to increase the share of state benefits rather than to fight for changes in the economic basis underwriting the state structure.

Earlier, we have indicated that one SC family in the sample could be classified as a rich household. This family is a typical representative of the upper-class leaders riding on the class assertion of their caste brethren and sisters. The respondent happened to be the wife of Kotwal Saheb. The husband is a retired police inspector, and till 1991 was solidly with the Congress. His and her families bear the imprint of that relationship: teachers, police officers, public sector managers, etc. The six sons and three daughters have landed in good positions or contracted good marriages. One of the sons-in-law at that time was a Congress MLA. Kotwal Saheb now has shifted to Kanshi Ram's party which he expects to help the educated SCs and OBCs. He candidly projects that Kanshi Ram is fighting only for a share in the government and in the administration, and that poverty and exploitation will not come to an end. Because of the BSP approach, however, and "through Mandal and the increasing power in the administration, it may help in reducing the atrocities".

This is the minimalist message of liberation and empowerment which goes down well with the weaker segments of the kurmi, yadav, kahar, and other OBCs and with the SC population in general. They want to get rid of the obnoxious, authoritarian, corrupt, repressive, arrogant and casteist 'punjipatti' (capitalist, synonymously used for upper castes).

That at least is the message which we got from scores of lower caste men and women, after rendering them a patient ear. The following account may illustrate the case. It is the tale of Munshi Harijan, a 35 year-old chamar who has already lost five of his seven children and scrapes through with agricultural labour work for which he usually gets a daily wage of three kg of wheat. Eastern Uttar Pradesh in a nutshell:

> You have come here and you are listening to us, but the people around here who should listen to what we have to say, they only order us around, and if we protest they will even beat us or call the police, and when we go to the police or to the block administration, their own people are sitting there and they won't even listen to what we have to say. Only our money they are prepared to accept, but then their own punjipatti lok give them more money, and that settles the issue. They are constantly fighting amongst themselves, but when it comes to dealing with us, or when the benefits have to be distributed, we are left with nothing but our mouth. That is the only thing we have, like monkeys, but even then we should not speak up. Our people do not have voices. The babhan (brahmins) have taken our land, and have captured village land, and all the parties are controlled by them. Nothing has helped. So, now we are planning to vote for the ashudh (untouchable) party, because even the educated and soft babhan who secretly may take water with us and who do less injustice, in the end line up with the other punjipatti of their ilk. If we had people in the administration, they would listen to us and we could do something about it. It is good that we now have some educated people amongst ourselves, and they can give us some information, because the babhan will never do that.

Some harijans gracefully remember the role played by some brahmin members of the CPI who indeed had helped them, and who had stood up against the punjipatti of their own caste, but that party has disintegrated, and the option for the BSP and Mulayam Singh may very well be an option by default with the intent of breaking the casteist hold of the punjipatti over their lives and their villages.

Communalism

The BJP had taken UP by storm. From a lilliputian position in the 1984 and 1989 elections, the party was catapulted into the top position in 1991. On what was perceived as the Ayodhya hindutva wave, the party secured 31.6 per cent of the votes (11.8 per cent in 1989), and formed the government. Since the BJP had fought the elections on the single issue of hindutva sentiments, the victory was explained as a vindication of Hindu unity against the so-called pseudo-secularists.

The most extreme communalist position involves the separation of Hindus and Muslims as separate ethnic identities, as separate nationalities, and then to argue that Hindustan belongs to the Hindus. Unlike the pseudo-secularist position, the communalists argue that India, or Hindustan, is the country of Hindus.

We have confronted the sample with three statements suggesting that there are no differences between Hindus and Muslims, that Hindustan is a country which basically belongs to Hindus with less rights for Muslims, and that Hindus and Muslims should have equal rights as citizens of Bharat. The reactions by the respondents belonging to the respective varna groups reveal a significant difference (Statement 2). The aggregate score of OBC, SC and Muslim respondents was 4.7, 1.2 and 5.0 which indicates a very strong agreement with the secular position. Among thakurs also, the secular position is dominant.

Brahmins, on the other hand, on the three statements relating to the rights of Muslims versus Hindus, had a score which hovers

Table 1: Classwise and Castewise Political Preferences, 1993

Socio-Economic Status	Janata Group	Congress	Communist	BJP	None
Poor	72	8	6	6	8
Middle	32	10	4	13	1
Rich	13	11	2	23	1
Brahmin	0	11	4	31	2
Thakur	9	4	0	1	
Bania	2	1	0	9	
OBC	68	3	3	1	2
SC	33	7	5	0	6
Muslim	6				
Total (per cent)	55.9	13.7	6.6	19.9	4.7
Elections 1993 (per cent)	64.5	5.5	–	28.0	

Table 2: Correlation Caste and Class

Economic Status	Upper Caste	Middle Caste	OBC	SC	Muslim
Very poor	0	1	10	35	1
Poor	0	5	30	14	4
Middle	27	3	28	1	1
Rich	26	2	7	1	0
Very Rich	11	1	2	0	0

around 3.0. The aggregate score is the statistical average of almost as many brahmins who take a secular position as compared to brahmins who want to treat the Muslims as second-class citizens. Among the vaishya bania castes, the communalists have a clearer edge over the secularists. Guptas and Jaiswals often take the most extreme position, and have no scruples in declaring: "Muslims should be asked to leave India and to go to Pakistan or to the Arabian countries".

The rich landowning class and the trading class, more or less congruent with brahmin and vaishya, have a pronounced communalist slant. Even if brahmins can vaguely be associated with a priestly caste and with a soft corner for the religious men, the bania definitely will not relinquish his power and earthly wealth to religious leaders. Nonetheless, that is the solution which presently fits into his scheme of power politics.

The Hindu slant of the traders, rich peasants, and administrators is not induced by religious piety and undefiled sodality, but by a basal political instinct: religion as a means of evoking loyalties against the dangers of a civic emancipatory process.

We have formulated three statements around the idea of having more interference by religious leaders, and the dharma imperative, in the running of the administration, or, in more abstract terms, the Ramraj. In Statement 3, we present the scores on two such opinions, namely, the contention that politics should be based on, and be inspired by religion, and that more religious leaders should get involved.

The bania caste, it appears, feigns a high degree of religiosity and a tendency towards a theocratic state. Most of them declare that politics should be based on dharma and religion and that religious leaders should be involved in the running of society and the administration. Brahmins tend to agree with the first position, but not with the second.

OBCs and SCs live in a world apart. Their religious worldview and practice is a world apart from the brahmanical beliefs, and they have understood, or have come to understand, that religious leaders operate hand in hand with the interests of the punjipatti. Their support for a theocratisation of politics, based on the 'imam', the 'sadhu', the 'pandit' and the 'yogi', is generally ruled out, with some exceptions though.

The exceptions within the 'jati' are not related to economic position or gender, but to age. The ten lower caste people who would like politics to be based more on religion are in their 50s and 60s. Only four of these 10 people also approved of the demolition of the Ayodhya mosque.

Here we come to the central argument in the BJP argumentation in the months preceding the destruction: the imperative of the Hindu faith over the constitutional and legalistic arguments. Since the Hindu did believe that Ram was born on that very same spot, and that the infidel Babur had destroyed the temple erected on Ram Janmabhoomi, the Hindus were entitled to undo the historic wrongdoing.

Although the argument is utterly ludicrous (the BJP itself would not like to concede the 'Kashmiri Belief'), the question which concerns us here is whether it indeed reflected 'The Hindu Belief', or whether it possibly was only a small minority asserting its 'Might Is Right'. For answering the question, we can rely on two sets of data referring to the same area. The first set relates to 162 members of the panchayats, and the second set is the same sample as described in the earlier section.

The fieldwork among the panchayat members was conducted from August 1990 through October of the same year, a watershed period in the political history of India. It was weeks before the first assault on the Babri masjid in Ayodhya.

On the basis of the class position of the five BJP panchayat members at that time, it was apparent which class its future support would draw on: with the exception on one middle-peasant, the others are rich peasants, and three of them have at least a BA degree. And above all, they are brahmins.

The other brahmins in 1990 were still siding with Congress, but the political collapse of their traditional party impelled them to look for an alternative. Such an alternative was urgently required because the signs of the time were ominous. The lower castes had become more vocal in their demands, and, through V P Singh and Mulayam Singh Yadav, had got a fat finger in the pie in the Lok Sabha and in the state assembly. The extension of job reservation to the OBCs in the summer of 1991 was commonly condemned by the brahmins, thakurs and banias as an unjust solution, reinforcing casteism and hurting the poor people across the caste spectrum.

While the immolation politics of brahmin students made many regions in northern and north-western India sink into chaos, the BJP hits on a novel idea to re-unite the Hindu masses: Ayodhya.

When it launched its offensive against the wrongs of history, the BJP claimed to speak on behalf of the Hindu masses. On the basis of our findings in late 1990, it is plain that the party did speak mainly on behalf of the brahmins. In addition to 23 brahmins (slightly more than half of the brahmin membership), we found only one thakur and one chamar who supported the idea of demolishing Babri masjid in order to construct the Ram mandir. Their arguments in favour of such a neither transcendental nor peaceful operation were still couched in a defensive complaint rather than in a belligerent language, but belligerence was on the increase.

Many Dubeys, Chaubeys, Mishras and Upadhyayas felt the blight of the new developments, and the major underlying discursive element was that of a fate at stake. For too long, the sentiments of the Hindus had been disrespected in the name of pseudo-secularism. Harishankar Upadhyay, the

Statement 2: Hindus and Muslims

	India Should Be Hindu	No Hindu Muslim Difference
Brahmin	2.9	2.7
Thakur	1.9	3.9
Bania	3.0	2.7
OBC	1.3	4.7
SC	1.2	4.8

Note: The value close to 1 signifies strong disagreement; a value close to 5 signifies a strong agreement.

Statement 3: Politics Must Be Based on Dharma and Religion

	Religion in Politics	Religious Leaders in Politics
Brahmin	3.5	3.1
Thakur	2.1	1.9
Bania	4.1	3.5
OBC	1.3	1.2
SC	1.1	1.1
Muslims	1.5	1.5

Statement 4: Temple Politics

	Religion Misused for Political Power Game	Temple Should Be Built
Brahmin	2.8	3.5
Thakur	4.4	1.9
Bania	3.6	3.2
OBC	5.0	1.1
SC	5.0	1.1
Muslims	4.8	1.0

Note: As in the previous statements, 1 denotes strong disapproval and 5 denotes strong approval.

Statement 1: Political Parties Should Be Based on Caste

Caste	Score	Frequency	Score	Frequency	Economic Position
Brahmin	1.0	51	1.1	14	Very Rich
Thakurs	1.2	14	1.1	36	Rich
Middle Caste	1.3	12	1.1	61	Middle
OBC	1.4	77	1.3	53	Poor
SC	1.7	51	1.8	46	Very Poor

Note: The individual scores range from 1 (strong disagreement) to 5 (strong agreement). The scores obtained from the reverse formulation of the statement produce more or less the same aggregate results.

young graduate in a landed family, successively fulminated against the government for not doing anything for the brahmins and the thakurs, and against the Muslims for suppressing the Hindus: "It is the highest time that we start reacting. Government is not doing anything for us. Nowadays, we have become the slaves of the lower castes and of the Muslims. Do you expect us to go and build a temple in Pakistan? No, but they have built their mosques here, destroying our temples. The sacred Ram Janmabhoomi has been left in their hands for too long, because the Hindus were timid and submissive. This historic wrongdoing towards the Hindus has to be remedied. It is a matter of national pride. Why should the Hindus continue to live as second class citizens in their own country?"

The brahmins contributed '*chandan*' to the construction of the temple. A few non-brahmins have followed their example, but even when they have done so, it has been a qualified chandan. On the lower scale of religiosity, the OBCs are more religious than the SCs, and around one half of them agree that a temple for Ram should be built. Or rather, they do not mind its construction, but only side by side with the masjid. Their axiom is explicit: "Holy places cannot be demolished".

The idea that holy places, belonging to whatever religious denomination, should be respected, stems from a widespread acceptance that there is only one god, and, as one female member asked rhetorically: "If God is the same, how can there be bloodshed in his name?". The female panchayat member happened to be a Muslim, but her ecumenical attitude towards religions was found commonly among the Hindu lower castes as well.

The approach of many yadavs and kurmis and of a few brahmins springs from a germane understanding of the importance of religion: "It is alright if a temple will be built there, but if this is going to lead to a revolution, if people are going to slash each other's throats, then it should not be done. After all, Ram does not live there, but we live in this country and this country should not be ruined for the sake of a building. That is utter nonsense".

Among the SC members, hardly anybody, in the monsoon of 1990, relished the idea of a temple construction. Above all, they wanted peace. They wanted to live peacefully with the Muslims and, above all, with the brahmins, which is experienced as more of a problem. The admonition to what they call 'the Hindus' is that they should start treating them in a humane manner, and not as untouchables. Whereas such a change in the behaviour of brahmins will benefit them immensely, the construction of a temple does not benefit anybody. Moreover, they argued, there already are so many temples in the country. Most temples in their villages are only good for dogs. They roam around there. Nobody else goes there, not even the brahmins. From such a perspective, born out of lived-in experience, there was hardly any support for the construction of yet a new temple.

The sample of 220 respondents which was taken three years later, i e, after the demolition of the Babri masjid, only confirms the positions which the different categories of Hindus had taken towards the end of 1990, with a further polarisation though (Statement 4). The brahmins and the banias have moved further in the direction of the Hindu Belief that the temple should be built.

A dramatic reconsideration has taken hold of the OBCs: whereas in 1990, around half of them had agreed that a temple could be built, the new position is clearly that a temple should not be built. This actually follows from the position taken earlier that a temple could be constructed side by side with the mosque, but not at the expense of the mosque. The OBC segment virtually collectively has shifted against the iconoclasts.

The BJP leadership claims that its line on hindutva and Ayodhya has been rewarded by the Hindu electorate. It has not done as well as desired, but even then 1993 elections ended with a small increase in popular support. The explanation relies on statistical fudging rather than on substantives. It is clear that the destruction of the mosque has cost the BJP dearly.

The OBC and SC electorate has disapproved of the political skirmishes at Ayodhya as a religious disaster and has clearly pointed its finger at the guilty players: the brahmin punjipatti of the BJP. As it happens, Ayodhya has been very much in the village news (*Bahut kuch sunte hai*), and people are very much conscious of who has done the demolition of the house of god. The blame is put on the BJP (49 per cent), the brahmins (19 per cent), the Bajrang Dal, sadhus and Ram bhaktas (17 per cent) and Congress and BJP (7 per cent).

The fact that the BJP has not been wiped out is to be explained in terms of its reincarnation as the strategic party of the ruling class. The Congress had performed that function till the late 1980s when it rapidly desintegrated and the swing towards the BJP followed. In the Jaunpur area, as the graph illustrates, the BJP ascendance since 1989 has been at the expense of the Congress.

Conclusions

We have presented some preliminary findings of an ongoing research project. The findings in many respects are similar to the findings which we obtained from two other districts, namely, Muzaffarnagar in western UP and Rae Bareli in the Avadh region of the state. The findings may thus apply more widely than to Jaunpur alone.

In respect of casteism, while agreeing that the BSP formation thrives on a casteist ideology, the lower castes (SC as well as OBC) clearly continue to maintain a politically anti-casteist attitude. It is rather the upper castes who maintain caste segregation and exploitation. Paradoxically, now, when the emancipatory stirring from below manifests itself, they want to imprint on this stirring the defamatory seal of casteism.

In respect of communalism, the internal divide shows up again. Whereas the OBC/SC/Muslim population maintains an ecumenical attitude, the upper castes have clearly taken on the 'trishul' as their new symbol. The lower castes identify the trishul and the Ram Janmabhoomi not as symbols of salvation, but rather as devious ways of class suppression. The upper castes, identical with the dominant economic classes, have made use of the masjid-mandir controversy in order to beat back the emancipatory movement of their reserve army of workers. The OBC\SC\Muslim combine has not allowed this to happen. They are opposed to the mixing up of politics with religion, and are keenly convinced that the BJP had tried to take them for a ride.

The overall conclusion validates the journalistic metaphor used by Praful Bidwai (*The Times of India*, December 4, 93) to explain for the 'bursting of the BJP hindutva bubble' in the UP elections: "The BJP is not only on the wrong wavelength but in the wrong waveband altogether".

[The research on which these findings are based forms part of a wider project in collaboration with Ravi Srivastava (Uttar Pradesh) and Ratan Khasnabis (West Bengal). The project is financially supported by Indo-Dutch Programme on Alternatives in Development. IDPAD cannot be held responsible for the findings and interpretations contained in the article.

Urdu Education in India

Four Representative States

Ather Farouqui

Urdu has become a language of the Muslims and Urdu education is sought only by poor Muslims in most states of India. The most important contributory factor for this state of affairs is the lack of support offered to Urdu by state governments.

URDU has been so neglected in India that it has become the language of only the Muslims. In other words, Urdu education has become synonymous with Muslim education. It is also worth mentioning that an impartial and unprejudiced account of social and political conduct of the Muslims as well as the causes of their backwardness in education cannot be examined unless the dimensions of the politics, around, Urdu after independence are understood and examined. The cause of Muslims' backwardness in India is mainly associated with their religious and social complexities. But this analysis will remain incomplete and one-sided until it is admitted in principle that the Muslim backward sections are not very different from the other backward Indian communities. Though at some levels it is easy to recognise the difference between Indian Muslims and the other backward communities in India, an analysis of the social and educational condition of the Indian Muslims is essential at various levels, especially comparing them with other communities because the circumstances and educational condition differ at every level.

An extensive survey through Bihar, West Bengal, Andhra Pradesh and Maharashtra disclosed, surprising, that there was not even a single non-Muslim student enrolled for studying Urdu even as an optional subject at the primary or secondary level, or opting for Urdu as the medium of education. It is disheartening to note that to date no authentic information is available about Urdu language or education. Neither the government nor any private educational body has ever tried to conduct any research in this field On the contrary, after independence, attempts were made by every government to erase Urdu.

The first survey on Urdu was conducted in Uttar Pradesh. An analysis of the state of Urdu education in some states above is available and an assessment is made here on the basis of the drop-out rates in five schools from each of the four states, namely, Andhra Pradesh, Maharashtra, Bihar and West Bengal besides UP.

Urdu is taught in some schools as an optional subject either from sixth class onwards, or, in certain schools from first to 10th class. There is a provision for teaching Urdu as an optional subject from sixth to eighth class at a few places in UP. There are some schools where Urdu, besides being taught as optional subject from first to 10th class, is also the medium of instruction. In some schools the regional language is also taught as an optional subject from third or fourth class onwards

Interestingly, even in Urdu medium schools subjects like science and maths are generally taught in English or the regional language (including Hindi medium). The main reason for this is lack of adequate scientific vocabulary in Urdu. Urdu is the medium of instruction only for social science subjects, like history and geography, etc. In some states private publishers have started publishing Urdu books in science and technology by using technical vocabulary picked up from Pakistani publications. Some publishers in Maharashtra have gone to the extent of republishing the Pakistani books illegally. But this development is still in its initial stage. In Hyderabad province, before independence an experiment to introduce higher education through Urdu medium, initiated by the then Nizam of Hyderabad, had proved a great success. In this connections 'Darul tarjuma', an institution set up for translating technical books into Urdu, did a commendable job. After partition the political role of Hyderabad became uncertain. Urdu had already come to be accused as a means of precipitating the partition of India. As a consequence Urdu was abolished as a medium of education and the stock of books produced by Darul-tarjuma was burnt to ashes in extraordinary circumstances. There are a few Urdu medium degree colleges in Andhra Pradesh but practically, Urdu remains merely a medium of examinations and not of instruction since most of the course books are available only in English or the regional language. Students whose mother tongue is Urdu prefer Urdu as medium of exams, rather than the regional language.

In almost all the states in India, except Maharashtra, Urdu education has reached the verge of death. Middle, low income or lower-middle class people who make their wards receive education in Urdu medium have to face a number of difficulties. Urdu as a medium of instruction is available only up to the secondary stage. Consequently, Urdu medium students lag behind regional language or English medium students. Urdu medium students opting for regional language as the medium of instruction have to drop Urdu education which remains the only source of study of Islamic literature in India. Of late, the Jamat-e-Islami has started the publication of the Quran and other Islamic literature in other languages but this work is still in its infancy. Muslims have not yet taken a clear decision either to adopt Urdu or allow it to be confined to regions where the feelings of regionalism are strong.

The condition of the Urdu language and Urdu education is most pitiable in Uttar Pradesh, a state which has been the traditional centre of Urdu learning for centuries. There is not even a single primary or junior high school of Urdu medium. The only two Urdu medium high schools are those run by and affiliated to Aligarh Muslim University. Consequently, the generation born and brought up in this state after independence is quite unfamiliar with Urdu. They are neither aware of the problems faced by Urdu, nor do they have any emotional attachment to it. The occasional references to Urdu literature and Urdu culture are limited to Urdu newspapers and, of course, the history-books. During the last decade there has been a mushroom growth of private schools everywhere in the state. This phenomenon has given rise to several technical complexities in the field of education. Fifty to 60 per cent of such schools are unrecognised. Still, the middle and lower-middle class people opt to send their children to these schools for education, even though it is very well known that these institutions are merely business centres. These unrecognised schools which are nothing more than teaching shops give admission to children up to fifth standard after which the students have no other option than seeking admission in the civic schools, which is possible only by greasing the palms of the concerned officials. Later the certificates from government schools entitle them to get admission into high schools or intermediate colleges.

Interestingly, though there is no facility for teaching Urdu in Uttar Pradesh, students can opt for an Urdu paper at the junior high school examinations. At some

places the high school and intermediate students of science and commerce group are allowed to take Urdu as an optional subject but in place of English. It is worth noting that such an option is not available to the students of the agricultural group. This arrangement leaves no option for a student other than dropping Urdu-first, because English, by and large, still enjoys a great popularity and, second, because the technical terms used in science and commerce have no equivalent in Urdu. It is quite clear that the curriculum has been fixed in such a manner that even if students want to they cannot take Urdu. There are very few schools offering Urdu as an optional.

A majority of the privately run junior high schools are unrecognised in UP, some have recognition only up to fifth standard. It has become a common practice now that the unrecognised schools arrange for their students to appear in junior high school examinations in other recognised schools as private candidates. People who are familiar with system of primary and junior high school education in the state know well that the students appearing in these examination have their results bought for the money they can pay. As a result the number of junior high schools in UP is increasing by leaps and bounds because all their students pass in the first division. But even in these schools the number of students offering Urdu medium does not exceed 500, and, again a majority of these students appearing in such examination are private candidates sponsored by the so-called teaching shops.

The case of UP has been referred to as an example. But the fact remains that there is literally no provision of Urdu education in this state. This observation is, however, essential for a study of the conduct of Muslims towards Urdu language and education especially keeping in view the pathetic economic condition of the Muslim masses.

Three-Language Formula and Urdu

The aim of introducing the three-language formula in India was to enable the child at the primary level to gain knowledge of the other important and necessary languages, along with the national language. The above interpretation of the scheme of three-language formula, which was widely publicised by the politicians, and, especially the chief ministers of northern Indian states, has played a major role in bringing an end to the provisions for the study of Urdu. Seen in this light Urdu appears neither important nor necessary, especially after the deliberate thrust given to Hindi. As a result, Urdu's end is imminent.

The central government's step-motherly treatment to Urdu, and, for that matter to all the regional Indian languages in comparison to Hindi, as also the tendency to neutralise the significance of mother tongue as a medium of primary education of a child has made for a number of problems. In the case of Urdu all sorts of political manoeuvres have been used against Urdu-speaking masses to neutralise their right of getting primary education in their mother tongue, i e, Urdu. The census staff in northern India took it for granted that the mother tongue of every one in the area is Hindi. They noted Hindi as the mother tongue of the Urdu speaking people even without consulting them. It is shocking that in the 1991 census the mother tongue of even well known Urdu writers has been given as Hindi in spite of their protest. Some of these people even knocked at the doors of courts and the concerned higher authorities. If the government itself can go to the extent of openly declaring a region with mixed languages as a purely Hindi region, who is the authority to hear complaints against the erring census officials?

The three-language formula enunciated in the Resolution on National Policy on Education was introduced with the sole purpose of giving emphasis and a proper place to mother tongue in primary education of a child. Later, in 1975, the Gujral Committee amended this policy and produced it in Table 1.

The south Indian states as also West Bengal refused to introduce this formula. This move somehow had an adverse effect on Urdu. Tamil Nadu excluded Hindi openly and bluntly and adopted a two-language formula based on English and Tamil. The fact is that Urdu had to bear the brunt of the agitations against Hindi in the southern states. In the light of these incidents the chief ministers of northern Indian states took the liberty of interpreting the three-language formula according to their whims. As a consequence no room was left for Urdu. The following plan was devised:

(1) Regional language, i e, Hindi was accepted as mother tongue. The status of regional language had been granted to it earlier.
(2) Under the three-language formula one of the modern languages of Eighth Schedule was decided to be given a place. Ironically, the chief ministers of northern Indian states decided to place Sanskrit, a prominent ancient language, in this column, instead of Urdu, which undeniably is a modern language. Hence, Urdu was very cleverly eliminated. Interestingly, for the sake of preserving Sanskrit the government of India decided to set up a new commission on the pattern of the University Grants Commission, with an annual grant of Rs 50 crore. It is most unfortunate that Urdu, one of the important and rich modern languages could not attract any favour from the government of India.
(3) Under the provision of the study of one foreign language only English was granted the status of foreign language to be studied. But whatever may have

Table 1: Three-Language Formula

In Hindi-Speaking States

Present Formula	Proposed Formula
(i) Hindi	(i) Hindi (with Sanskrit as part of a composite course)
(ii) English	(ii) Urdu or any other Modern Indian Language excluding (i)
(iii) Modern Indian Language (preferably one of the southern languages)	(iii) English or any other Modern European Language.

In Non-Hindi Speaking States

(i) Hindi	(i) Regional Language
(ii) English	(ii) Hindi
(iii) Regional language	(iii) Urdu or any other Modern Indian Language excluding (i) and (ii)
	(iv) English or any other Modern European Language

The non-Hindi speaking states may also adopt, as an alternative, the following formula being implemented in Andhra Pradesh for the Urdu-speaking population: (i) Urdu and Hindi (a composite course); (ii) Regional language; and (iii) English or any other Modern European Language.

Students whose mother tongue is Urdu should learn Hindi and those whose mother tongue is Hindi should get an opportunity to learn Urdu.

Candidates whose mother tongue is Urdu should be assured of admission to teachers' training institutions so that enough teachers become available who can teach different subjects through the medium of Urdu.

been the reasons, there is no denying the fact that Urdu has been deliberately thrown out of the Indian education system after independence. It may have some importance on paper but practically our political and social setup has left no room for Urdu in the present social system.

IN THE STATES

Uttar Pradesh: About two crore Urdu-speaking people live in UP. There is a provision for appearing for the junior high school level examination in the Urdu medium in the state, but the number of such students is very small. This number was below 500 in 1982, as compared to nearly 40,000 in Bihar in the corresponding year. Even in the Muslim-dominated regions in UP most students opt for the Hindi medium There is only one Urdu medium junior high school in district Badayun. Only three girls from this school appeared for the junior high school examination in 1987. This number reduced to two in 1988. In Moradabad district only two girls' schools provide education through the Urdu medium. People running the Muslim junior high schools confess that Muslim students prefer Hindi medium to Urdu and a sizeable number of Muslim parents take their children out of Urdu medium schools and admit them in Hindi medium schools.

Urdu is, however, not the medium of education in UP. Schools which prepare their students for junior high school level examination in Urdu, in fact, have Hindi as a medium for all the subjects. Urdu, in these schools, is taught only as a subject. Teachers capable of teaching through Urdu medium are generally not available in the state. At a few places Urdu medium primary schools are run by local bodies where teachers were appointed under the Bahuguna scheme. But in most of these schools Urdu is taught as an optional subject. Most of the people appointed under the Bahuguna scheme, the so-called Urdu teachers, generally do not even understand what is meant by the term Urdu medium

Therefore, in UP, Urdu education means teaching Urdu as a subject. It is unfortunate that few of the so-called Urdu teachers in UP can even read the books in Urdu script meant for primary classes. It has also been observed that the Urdu teachers in UP are engaged in their family occupations like agriculture and milk dairies and go to the school once or twice a month. It appears that the recruitment of teachers in the name of Urdu under Bahuguna scheme was only meant to appease the Muslims. It is very well known that the late H N Bahuguna was called the messiah of the Muslims. That was the time when even if a matriculate Muslim was recruited as an Urdu teacher. Later these people were imparted nominal training in teaching. They were also granted opportunities to appear in Oriental Urdu Examinations. Ironically, it was difficult to find Urdu-knowing youth matriculates from among the large Muslim population. Even today there are countless Urdu teachers recruited under that scheme who do not even recognise the alphabets of Urdu language It may be noted that the weekly holiday in these Urdu medium schools is observed on Friday which coincides with the weekly 'namaz' the Muslims offer on this day and which for Muslims has a special importance. This clearly shows that even the government accepts that Urdu schools are Muslim schools and that Urdu is the language of Muslims only. All the teachers recruited under this scheme also happen to be Muslims.

Andhra Pradesh: Hyderabad, the capital of Andhra Pradesh has been the historical centre of Urdu The Osmania University of Hyderabad has the credit of making Urdu the medium of higher education and it was here that Urdu was the medium of education up to engineering and medical science levels before partition. After independence and the subsequent reorganisation of states in 1956 Hyderabad became a part of Andhra Pradesh state, and things started changing from this point. The historic police action in Hyderabad was in fact the beginning of the downfall of Urdu there. Now, Urdu is moving fast towards its imminent death in Hyderabad. The old generation of Hyderabad, for which Urdu was the symbol of their characteristic etiquettes and culture, too, is in the last stages of its life. But the significant example of the total extinction of Urdu is that in UP and some other states where the use of Urdu had been put to an end at every level after independence. In other states the process has been slow but well-organised. In places like Hyderabad the position of Urdu has not changed only among the lower sections who get indoor Urdu education and up to the limit of religious 'madarsas'. The upper and middle classes too have bid goodbye to Urdu language and literature, not to speak of Urdu as a medium of instruction.

In Andhra Pradesh there still remains some provision though not satisfactory, of Urdu medium education and teaching of Urdu as an optional subject. A good number of students go to the private Urdu medium educational institutions run by Muslims. Some of these institutes are from primary up to the degree college standard. In Hyderabad there are a few

convent schools also where Urdu is taught as an optional subject. However, the students learning Urdu as optional subject up to primary standard in these schools have only a rudimentary knowledge of Urdu.

As in the other states, in Andhra Pradesh also, more than 90 per cent of the Urdu medium students come from lower middle class. Most of these students have studied Quran at home. There are some children who attend Urdu medium schools in morning and acquire religious knowledge at evening in dini madarsas (religious institutions). In Andhra Pradesh, apparently there are not many obstacles in the way of Urdu education. Yet, the circumstances as a whole cannot be said to be encouraging either. The drop-out rate of Urdu medium students in Hyderabad vary at both the primary and secondary level. While from class one to class ninth it is 40 per cent, from class six to class 10th it stands between 1 per cent to 43 per cent Normally the NCERT books are used, because the books published by Urdu Academy or by other government institutions though they are cheaper, are generally not available in the market. Often by the time these books reach the market, half of the academic session is over. The economic condition of the Muslims of Hyderabad is poor and may account for a high drop-out rates.

The state has provision that the students can read the books in other languages (regional or English) but can answer question papers in Urdu in the examinations. This is the position of Urdu at college level. English vocabulary is abundantly used, specially in the study of science, commerce and technical subjects. No doubt that the half-a-century old vocabulary of *Darul-Tarjuma* is still in use.

Maharashtra: Maharashtra is perhaps the only state in India where there is no apparent obstacle in the way of getting education in Urdu medium. This is due to the relentless efforts of various trusts and voluntary Muslim organisations. As most of the Urdu teaching schools and colleges are run by private bodies and the leading Muslim businessmen, the chances of mismanagement are remote. What gives satisfaction is the regular presence of Urdu teachers and regular holding of classes in the schools and even colleges. All the subjects in these schools are taught through the Urdu medium.

The Maharashtra government's attitude towards registration of Urdu schools has been sympathetic and co-operative. In Bombay city alone there are 124 registered Urdu medium high schools. The number of registered Urdu medium schools in the whole of Maharashtra, including Bombay is 230. The condition of Urdu teaching at primary level is also satisfactory and encouraging in comparison to schools of other languages run by the state government Table 2 shows the number of Urdu schools, teachers and students as compared to Marathi and Hindi in the state.

TABLE 2

	Marathi	Urdu	Hindi
Primary schools	569	230	185
Students	3,72,375	1,22,475	1,26,911
Teachers	9,316	2,727	2,592

Note: In the case of Urdu the centres for training the primary teachers is merely 2. Thirty teachers are engaged in these centres imparting training to 312 trainees.

It is interesting to note that in Maharashtra even middle class Muslim prefer Urdu education unlike other states where people prefer sending their children to convents; and in these states, too, only lower-middle class Muslims send their children to Urdu schools. One reason for this is that the Muslims of Maharashtra in general, and of Bombay in particular, hail from business communities. Some of the convent schools of Maharashtra also offer Urdu as an optional subject. But neither the students nor the teachers show much interest in Urdu in these schools. There is one more facility in Maharashtra which is not available in the other states. From primary to college level Urdu can be offered as an optional subject even in such schools and colleges where there is no provision for teaching Urdu owing to lack of required number of students and teachers. The desirous students are allowed to offer Urdu as an optional subject and appear in the examinations. However, they have to study and prepare themselves for exams on their own.

The course books are prepared by the Text Book Bureau. These books are initially prepared in Marathi, and later translated and published in Urdu. This means that the course material, both in Urdu and Marathi is the same. Besides, there are some other private publishers who also publish Urdu books.

Bihar: Bihar is another state where the condition of Urdu is satisfactory even without government favour and aid. The main reason for the popularity of Urdu in Bihar is the deep attachment of poorer section of Muslim society to Islam. Therefore, the people prefer sending their children to dini madarsas for religious education. Besides, most of the religious literature is available in Urdu only.

In Bihar, every year, at least 50,000 students take junior high school and high school examinations in Urdu medium. The state has 23 colleges teaching Urdu and 80 high schools. Urdu-knowing people have little liking for convent education because a major part of Muslim population belongs to backward and lower-middle class. Dini madarsas have played a significant role in the development of Urdu in the state. The state government also recognises the degrees of 'Madarsa Education Board' as equivalent to the degrees of other recognised boards and universities. These madarsas have also started technical education but it is in its initial stage now. Unfortunately, the 'Bihar Madarsa Education Board' is the most deformed of all educational bodies in India and is the biggest centre of all the possible irregularities and corruption from top to bottom. If the state government decided to take some steps to systemise its functioning, a revolutionary change in Bihar education system is possible.

The courses in Bihar are devised by the Rajya Bhasha Vibhag (State Language Department). But the course-books here are hard to get. Urdu books arrive very late in the markets. NCERT books are almost impossible to get. That is why mostly the RBV books are in use in the state. Though the overall condition of Urdu education is not disappointing in Bihar, it certainly is the worst managed and, therefore, the lowest in standard. Perhaps it is overlooked because only the backward and lower-middle class of Muslims have adopted Urdu medium education.

West Bengal: West Bengal provides the largest possibility for education in mother tongue. Primary education only in mother tongue is the clear policy of the state government here. With this purpose in view, mother tongue is the medium of education in all the government institutions. The minority schools, too, are recognised on this basis. West Bengal is faced with the problem of want of schools to cope with the large number of Urdu students. There are several areas where there is only one Urdu medium school for a population of 20,000. A great flaw in government policy is that it does not make the population the basis for recognition of schools and facilities of primary schools are granted on the basis of all minority communities taken together. This policy gives more benefit to Christians and other smaller linguistic minorities, and proves disadvantageous to Urdu-speaking minority in the sense that it widens the progress gap between them and other minorities. The state provides aid in the shape of books up to fifth class but, unfortunately, the Urdu books sometimes reach the student only by the end of the session. As a result of this delay in getting the books in time, the students are compelled to purchase the same from the market. The dearth of adequate resources for Urdu educational institutions is one of the biggest problems of Urdu minority. Most of them are in shocking condition.

New Economic Policy, Voluntary Organisation and Rural Poor

G S Aurora
Shashikala
S K Gayathri
Smriti Srinivas

While globalisation, liberalisation, deregulation and privatisation are the focus of the New Economic Policy at the macro level, it is important to get a clear understanding of both the threats and the opportunities emerging out of these processes at the micro level for individuals, families and local communities.

A SEMINAR and workshop were held at the Institute for Social and Economic Change (ISEC), Bangalore, on December 15, 1993 on the 'New Economic Policy, Voluntary Organisations and the Rural Poor' as a part of the project work, 'Policy Research and Voluntary Action'. Welcoming the participants, P V Shenoi stated that the ISEC had been interested in the structural adjustment policy (SAP) and rural development, since in its 20-odd years of existence, its research had been committed largely towards evaluating and directing public policy and had been related to the cultural parameters of development. Inaugurating the seminar, L C Jain noted that the research effort undertaken at ISEC was a unique experiment since it involved a joint effort by academicians and voluntary agencies. He stated that the structural adjustment policy has been understood in terms of its macro-policy implications with an emphasis on globalisation of the economy though, to come face to face with the rural poor, we must emphasise micro-level developments based ultimately on the principle that localisation of the economy is the need of the hour.

The seminar included papers on the historical background of IMF policies, the social and economic perspectives of SAP, and gender sensitivity in social science research, to mention a few. A number of points were raised by the participants during the discussions—the need for collective action to protect the autonomy of local-level communities and the importance of traditional inter-village linkages in the face of inroads made by commercialisation. The need for focusing on intra-community inequities, such as those suffered by dalits and other oppressed groups, was highlighted.

In a presentation on 'The Social Dimensions of the SAP', G S Aurora dealt with the crisis faced by rural communities in semi-arid tropics which cover the major portion of the agricultural landscape. He stated that there has been a degradation of the ecological base of these communities: village tanks, for example, have been neglected since independence and mechanised pump sets and tube-wells have been proliferating. Both these lower subsoil water-table levels and farmers with the capability to invest in irrigation facilities shift to wet lands instead of providing irrigation facilities for the survival of dry land crops. Therefore the food base of the poorer segments of the village population which is dependent on the production of coarse grains is reduced, and market-led growth in the form of SAP creates a further danger to their survival since it is not based on the principles of collective action of a village community, but individualistic enterprise. This paper led to a debate on the feasibility of regenerating village-level unity based on collective action. Some grass roots workers felt that in their experience, collective action for entire village communities was feasible, for example, in the creation of food banks locally, the provision of drinking water, watershed management, and so on, which were controlled by village representatives themselves; these minimised the exploitative tendencies of the market. There were criticisms of this approach from others: it was felt that the power structure within villages denied poorer classes access to common resources and, therefore, the idealistic idea of 'village' development was tantamount to strengthening the power and economy of dominant segments of the village.

This view found an echo in a paper by Corinne Kumar titled 'Research as Re-vision: Towards a New Feminist Scholarship'; there was a parallel between these holistic analyses of village communities and a thrust towards their so-called integration, and gender studies which intended to make women more 'visible' only to fit them into existing notions of work, skill, and development. For example, while there are many studies of the status of women workers, the displacement of women by men due to technological change, etc, none of these touch the basic premises of the industrial mode of production paradigm. Not only is women's work not wage work, but of a kind that does not fit into frames used to measure "male wage labour". Thus it was felt that groups such as the poorer classes, dalits and women may have world views and needs that should not be assumed to be equivalent to those of the dominant classes in order that researchers do not participate in the hegemonic processes of dominant groups in society.

The last four days were spent on a methodology and training workshop for the voluntary agencies. The methodology workshop focused on equipping the participants with the various tools that would be used in the project, with specific emphasis on the PRA method conducted by MYRADA.

The Project

The interest in the SAP at ISEC started with the introduction of the programme launched by the government of India in July 1991. ISEC became an arena of dialogue and networking between the institute and voluntary organisations who sought to understand and assess the nature of the relationship between the state and civil society under liberalisation. A number of meetings were held over a period of time, an important one was held on July 2, 1992 in ISEC. These efforts culminated in the research project 'Policy Research and Voluntary Action'.

It is envisaged that the project will integrate the two levels of discourse on the SAP, i e, the study of its general impact, performance of the economy in specific fields, and specific SAP policies; and the critiques of development, science, and technological reason implemented by the Indian state in SAP-type policies both by academics and people's movements. The political nature and cultural imbedding of development and state policy is recognised by the project, as well as the fact that poverty and economic change cannot be visualised as a mere managerial problem of the Indian state. If the rural poor, women and dalits, are to be placed at the centre of the humanistic concerns of this research then the historicity of their cultural being, their needs within a democratic policy, their resistance to what

Table

Threats	Opportunities	Strategies
(1) Disruption of traditional craft markets	Discovery of new craft designs and markets	Training and market organisation of the craftsmen
(2) Reduced support to the PDS system	Design of a PDS based on local resources mobilisation	Mobilisation of production and distribution locally
(3) Reduced support to the PHC	Design of local health system based on preventive health care	Revival of ethno-medicine and bare foot doctor programme
(4) Reduced support to the state educational system	Strengthening of primary and functional literacy programmes	Development of teachers to help in skill development
(5) Decreased employment on public works	Increased employment in land development	Watershed development, based on community effort

may be perceived as domination by the state or by elites, or the many ways of voicing their demands will have to be justly reflected.

As is well known, the SAP mainly involves four areas—globalisation, liberalisation, deregulation and privatisation, preceded by the stabilisation of the economy. While these processes are the focus of policy reforms proposed at the macro level, the concern of the present research endeavour is to translate the macro policies into the micro-level effects for individuals, families and local communities. A clear recognition of both the threats and the opportunities emerging out of the new economic climate can be briefly illustrated in the accompanying table.

With some of these considerations in mind, the methodology and the strategy of the project involves a triangulation between the academia, the voluntary sector and administrators—thus filling the chasm between the 'activists' in the field, researchers and implementers—to be better informed about the complexity of grass roots level situations. This is done in the belief that a confluence such as this would be far more realistic, flexible and 'people friendly'.

Altogether 30 villages have been selected from the four states of Tamil Nadu, Karnataka, Andhra Pradesh and Kerala to study the impact of the New Economic Policies. In order to make a meaningful comparison of the role played by the NGOs in the development process, 15 of the sample villages would represent NGO-operated villages and the rest would represent non-NGO areas. The NGOs selected are basically working on issues like tribal development, women and child welfare, environmental protection, and people's empowerment.

The project emphasises both qualitative and quantitative analyses: the primary data collection will involve the use of village, organisational and household level schedules covering crucial areas of the SAP impact such as the public distribution system, asset distribution, indebtedness, health, employment status, etc, to mention a few. Case studies and participatory rural appraisal methods will also be used as tools to analyse the data with special emphasis placed on participant research methods. The two sets of data would be supplemented by secondary data of various kinds and their analysis, thus contributing not only to theory, but also to policy formation.

Special area studies also form an important part of the project wherein problems like the changing relations of gender to poverty, the study of health systems, employment, and so on, would be studied by scholars across various disciplines at the ISEC.

Networking, which forms the central thrust of the study, is visualised as an instrument to facilitate the communication of grass roots level experience and efforts at various levels—the grass roots level itself, the district and the state level—by conducting workshops at each of the levels. Seminars for a wider audience of academicians and policy-makers will also be organised.

Self-Government and Its Instrumentalities

Nirmal Mukarji

Self-government of any kind must have not only a clearly demarcated field of activities, but also the instruments with which to govern in this field. Consequently, an essential power the states must endow the panchayats with is that to recruit and control their own staff. At the same time, unless traditional notions like permanent employment, security, service cadres and reserved posts are reconsidered, panchayats will be unable to innovate instrumentalities suited to their purpose.

I

A THIRD stratum of government is now a constitutional requirement. To what extent the requirement is fulfilled will depend on how far state legislatures are prepared to go in endowing powers and authority to their panchayats. It is likely that they may not go far enough. Their past performance has not been encouraging, and there is no evidence to suggest that state level elites are any more willing now to part with power than before. Therefore, it becomes necessary to try to be as clear as possible about the meaning of self-government for the panchayats.

A too miserly endowment of power and authority would amount to not complying with a constitutional directive. Such an eventuality would certainly be challengeable politically. In addition, though the 73rd Amendment says nothing about how to enforce its provisions, the issue could arguably be agitated in the courts as well, under the general law as it stands. Failure on the part of a state to legislate satisfactory enough self-government for its panchayats would not, therefore, be without consequences. It is conceivable that even the Supreme Court may, some day, be called upon to interpret the doctrine of basic features with reference to self-government at the third stratum.

II

Self-government literally means autonomy and the two expressions are used interchangeably. Contemporary history and current affairs are replete with instances where one or the other term has been employed to depict situations in which self-rule in some form has been at issue.

In our own country, prior to independence, these expressions were used at different points of time for different levels with different meanings. In 1870, the term 'local self-government' came into vogue to describe the limited reforms introduced in local bodies such as municipalities. In 1906, the Congress, under Dadabhoy Naoroji, adopted the political goal for the country as 'self-government on colonial lines', whatever, that meant. In 1919, a 'policy for the gradual development of local *self-governing* institutions' produced the curious system of diarchy in the provinces, under which effective power remained with the governors. In 1935, the above policy led to provincial *autonomy*, which did away with diarchy but kept safeguards and special responsibilities in the hands of the governors.

After independence, the confusion continued. The State List repeated, word for word, a 1935 provision for "local government, that is to say, ... municipal corporations, ... district boards, ... and other local authorities for the purpose of self-government", but in fact local government hardly advanced beyond its 1870 level. A directive principle required village panchayats to be units of self-government but this has remained on paper till now. The Sixth Schedule provided for autonomous districts and regions in the north-east, but these were cramped for governing space. The states have autonomy (though the word is not used), but not much more than the earlier provinces. There was the transitory experiment of an autonomous state, Meghalaya, within Assam. Currently, autonomous councils are on the anvil for several areas within existing states.

Looking abroad, most of the independent states that were republics of the splintered Soviet Union earlier have been trying to regroup as a commonwealth. The inevitable implication is that the states will lose some of their independence and become autonomous units within the commonwealth rather than completely sovereign countries. How much sovereignty has been, or will be, surrendered is as yet unclear. What is clear is that the giant state of Russia (RSFR) will dominate. But within Russia there are almost 90 republics and autonomous regions. Some of these, such as Tataristan, aspire to become sovereign, but must settle for only such autonomy as they can individually negotiate with the Russians.

In western Europe, when Maastricht takes effect, national sovereignties will surely be eroded, reducing the 12 member countries to autonomous entities in the overarching European Community. The process of erosion may not stop there. In west Asia, the festering sore of Arab-Israeli conflict has been lanced through an accord which gives limited autonomy to the Palestinians in Gaza and Jericho. An elected Palestinian council will have authority in five spheres: education and culture, health, social welfare, direct taxation and tourism. A Palestinian police force will look after internal security. An Israeli-Palestinian economic co-operation committee will work on subjects like energy, finance, transport (including the Gaza seaport), industry and the media.

The above summary, admittedly selective, shows that autonomy is highly stretchable. At a given time, it occupies such governing space at a particular level as can be negotiated between the concerned parties. But its stretch is not unlimited. At the upper level, it has to remain within boundaries set by federal centres as varied as Brussels (EC), Minsk (CIS), Tel Aviv (Israel) and New Delhi (the Indian Union). At the lower end, it must obviously stay above a threshold of minimum functions. This critical level is not easy to define, but is not indefinable. If its essentials could be identified now, the states would know how much is the very least that they must endow to the panchayats by way of powers and authority to make them recognisable institutions of self-government.

III

Sixty years ago, when the British parliament was debating the bill which led to the Government of India Act, 1935, the then secretary of state for India expressed his views on provincial autonomy in words which are worth recalling. Provincial autonomy, it may be mentioned, was one of the four vital principles of the bill, the others being all-India federation, central responsibility and safeguards.

> If it were only an administrative problem, the time was overdue to take a further step upon the road of decentralisation. The old government of India was adequate so long as the problems of government were comparatively simple. As, however, they became more complex, as political opinion grew up in the great provinces, so more and more it became inevitable that this step forward should be taken on the road of decentralisation. On the political side... it has been admitted by almost everyone who has studied the problem impartially that the reforms made under the Montague-Chelmsford scheme had outlived their usefulness.
>
> For both these reasons, it was necessary to take a step forward on the road to provincial autonomy. Provincial autonomy may mean one of two things. It may mean a kind of glorified county council government, under which the centre maintains a considerable

measure of control over the provinces, under which the centre makes grants-in-aid to the provinces, and under which the centre is ready to intervene when things are going wrong with the provinces... I believe myself that such a type of provincial autonomy in a country as great as India, with all its multiplicity of conditions, is totally impracticable. Any system of grants-in-aid and inspection from the centre will not work. Lord Curzon tried it a generation ago. Even Lord Curzon, with his great driving force and his great administrative ability, failed to make it work.

The only wise form of provincial autonomy is real provincial autonomy; a form of provincial autonomy in which the field of provincial activities is clearly marked out, and in which field the provinces are free from interference from the centre; a form of provincial autonomy that is broadly based on a wide franchise, in which the agricultural classes, the women and the depressed classes can make their voices heard; a system of provincial autonomy that is not dependent upon grants-in-aid from the centre, but subsists upon definitely allocated taxes... In any system of real provincial autonomy... it is essential and inevitable that law and order should not be reserved but should be transferred.

It is questionable whether the Act of 1935 provided the wise form of provincial autonomy spelt out above. For every provincial governor, exercising his individual judgment, carried special responsibility for the prevention of any grave menace to the peace and tranquillity of his province, as also for safeguarding the legitimate interests of the minorities as well as of members of the public services. And since the federal part of the act was never enforced, the governors continued to take their orders from the governor-general under the pre-existing command structure. From my personal experience in the political department of the then Punjab government at Lahore, I can testify that even simple letters from the centre were treated as firmans not to be trifled with.

The pity is that wisdom in regard to autonomy for the units of the Indian Union eluded us even after independence. The damage was done in the crucial period between the first Independence Day in 1947 and the first Republic Day in 1950, when the ruling elites at the centre were acculturated into the inherited system. Over-reacting to partition and its consequences, they went on further to constitutionalise a strong centre and introduce centralised planning. As a result, the states today resemble the glorified county council governments the secretary of state had warned against. The centre maintains a considerable measure of control over them; it makes discretionary grants to them, plan and non-plan; and it is only too ready to intervene when it likes. The first imperative, therefore, is to correct this founding distortion and accord the statewise autonomy.

The second imperative is to apply similar wisdom to the question of autonomy for the panchayats. This will require the field of panchayat activities to be clearly marked out. In this field the panchayats must be left free from interference from both the centre and the states. The panchayats must give the deprived sections, especially the poor and women, effective governing voice. They must not depend on discretionary grants from above, but function on the strength of statutorily devolved funds coupled with self-raised finances. Real panchayat autonomy cannot wholly exclude law and order, for local communities need good policing and that can come about only if there is a measure of accountability to such communities.

IV

It is elementry that self-government of any kind should have not only a clearly demarcated field of activities, free from outside interference, but also the instruments with which to govern in this field. In other words, devolved functions should be accompanied by the power to recruit and control the personnel required for the performance of such functions. Even the limited local self-government of the 1870 variety gave municipalities and district boards this power. The provincial autonomy provided by the Act of 1935 gave the provinces similar power, though restricted by safeguards exercisable by the governors. The Constitution rightly eliminated the safeguards and unambiguously gave the states power to regulate the recruitment and conditions of service of state public servants.

Consequently, when addressing ourselves to the question of self-government for the third stratum, an essential power the states must endow the panchayats with is the power to recruit and control their own staff for the performance of whatever functions that are devolved to them. The package of devolved functions should, of course, be such that autonomy at each panchayat level is real. For this, the subjects listed in the Eleventh Schedule must be treated as only indicative in nature and not exhaustive. Other aspects of administration should also be devolved to make panchayats truly self-governing. The functions that are devolved may differ from state to state, but power to recruit and control the connected staff must be there in each case.

India is the only major federal democracy in the world that gives constitutional recognition to its bureaucracy. That classic instance of federalism, the US, does not. Nor do Canada and Australia. Nor does the Federal Republic of Germany. The Indian exception is clearly a legacy of colonial rule. Sooner or later, serious thought will have to be given to deleting all references to the public services in the Constitution. So long as these continue, bureaucratic structures will remain rigid, defying reform. And public servants, noble exceptions apart, will continue to take advantage of their security to become more inefficient, corrupt and uncaring for the public they are supposed to serve.

However, for now, it is enough to note a major constitutional inconsistency. As a result of the 73rd Amendment, there will hereafter be three strata of government: the centre, the states and the panchayats. But, under the provisions of Part XIV, there will continue to be just two levels of public services, under the union and in the states. If the panchayats are to have their own staff, as argued earlier, either Part XIV will have to be amplified to introduce a third level, or else the state legislatures will have to be deemed sufficiently competent to endow the panchayats with the power to recruit and control their own employees. Constitutional niceties apart, the state legislatures are best fitted to deal with the staff question since it is they who will be identifying the functions to be devolved.

The extension of autonomy to areas like Bodoland, Jharkand and Leh is going to open a new and parallel channel of devolution to sub-state units. This could well set a principle on the basis of which distinct ethnic and geographical units across the country seek autonomous status. Already there is talk of autonomy for Chattisgarh and the hill areas of Uttar Pradesh. How the autonomy of these units will compare with the self-government of panchayats remains to be seen. The Darjeeling Gorkha Hill Council has, it seems, become the basic model for the new crop of autonomous councils. Therefore, it is worth noting that the DGHC has more autonomy than the panchayats and, in particular, controls the personnel deputed to it. Functions and staff thus go together. Perhaps this will be the case in the councils also.

It bears repetition that both panchayats and autonomous councils must have the power to recruit and control their own staff. Until they are in a position to exercise this power, all existing state employees handling devolved functions will need to be placed at their disposal on deputation. But this would be just an inescapable transitional expedient, to be gradually phased out as and when the panchayats and councils are able to recruit on their own. Logically, all government posts hitherto occupied by personnel to be deputed should be extinguished and fresh recruitment against these cease. The deputed personnel could be given the option to resign as state government employees on honourable terms, say, after two years, and seek absorption under the panchayats or councils, if they are wanted there.

Such an arrangement, of which the bureaucratic implications may require detailed consideration, would eliminate the vertical intrusion the state services would constitute

in an otherwise horizontal stratification of governments at state, autonomous council and panchayat levels.

Independence gave us an opportunity to restructure the country's bureaucracy. We missed it. For, we not only retained colonial structures, complete with constitutional recognition and safeguards, but vastly enlarged them. We retained them because the political leaders of the early years had too many other problems to attend to and, in any case, knew too little about administration to touch an institution led by the fabled Indian Civil Service. We enlarged them because the minimal governance of colonial times had to give way to the maximal requirements of free India's welfare and developmental objectives. Colonial structures were not suitable for the new situation, more so as they grew to outlandish proportions. But, unfortunately, what had been retained kept expanding.

The main features of the pre-independence bureaucracy were that every government employee was (or aspired to be) permanent and had statutory security, he was a member of some service, every service had a cadre, every cadre had posts reserved for its members and presiding over each service was a cadre management authority before which every member's knee bowed for career prospects. Sad to say, things are much the same now, except that there is more of every ingredient: government employees, security, services, cadres, reserved posts, cadre management authorities and, especially, bended knees. Over the years, the bureaucracy has established a mutually beneficial nexus with the political class. The two seem to govern mainly for each other. Not surprisingly, an exasperated public holds both in low esteem.

A new stratum of government with freedom to devise its own instrumentalities offers a fresh opportunity for change. If we miss this also, we shall have only ourselves to blame for the consequent infliction on the panchayats and the people of an obsolete bureaucratic system. If, on the other hand, we wish to take advantage of the opportunity, two simultaneous operations will be called for: throwing out the old and bringing in the new. Neither will be easy, the first because everyone (not excluding elected representatives) is too conditioned by the past and the second because no one is inclined to think of possible alternatives for the future. But unless traditional notions like permanent employment, security, service cadres and reserved posts are cast out, the panchayats will be unable to innovate instrumentalities suited to their purposes.

To break out, the panchayats must ask basic questions. Such as: do panchayat governments have to rely only on employees as their instrumentalities? The answer must surely be 'no'. A number of functions can be better performed through co-operative societies, whether for supply of credit or for agricultural marketing or for dozens of other things. Dairy co-operatives of the NDDB model are a prime example. Still other functions can be entrusted to registered societies based on self-help, of which a shining instance is the Gramin Mahila Shramik Unnayan Samiti (GMSUS) at Jhilimili in Bankura district of West Bengal. Yet again, informal associations of beneficiaries could be left to operate and maintain, for example, tubewells, eliminating departmental officials.

Another basic question: must panchayat employees be permanent and secure, exactly as central and state government servants? Constitutionally, 'no', if power to recruit staff is endowed by state enactments with no, or minimum, conditionalities. Administratively, the principle of accountability to the public should take precedence over the security of employees, though both are important. Any new system will need to strike a proper balance between the two considerations One way of doing so would be through contract appointments, extendable if performance is satisfactory but terminable, on suitable notice, if it is not. Safeguards against arbitrary or vindictive action could be built into contracts in the form of democratic processes to be observed by the concerned panchayats or gram sabhas.

Again: having regard to the problem of absenteeism in the rural areas, especially of school teachers and health functionaries, should panchayats give preference to local candidates? Before constitutional experts throw up their hands in horror, it may be mentioned that concepts like local areas, local cadres and preference or reservation for local candidates are already there as special provisions for Andhra Pradesh (Article 371-D). The question is whether state legislatures are competent to incorporate similar concepts in the recruiting powers they endow to their panchayats. In case the panchayats of a particular state favour preference for locals, the legislature of that state could at least consider the issue. And, in case a number of states feel the same way, any possible constitutional impasse could eventually be overcome.

Further: should there be reservations for women? The National Commission for Women is reported to have gone into the question and taken the view that reservations for women, across the board, should be examined in the light of Article 15(3) which permits making special provisions for women and children. More particularly, it considers that job reservations for women in panchayat appointments would be in consonance with the 73rd Amendment which provides for one-third reservation of panchayat seats for women. Also, sub-reservations for women within the reserved quotas of scheduled castes, scheduled tribes and other backward classes would not violate the basic structure of the Constitution. Until these points are finally resolved, state enactments should at least leave the door open for possible reservations for women in future.

If the states endow the power to recruit and control staff, as they must, should it reside wholly or primarily at the district level or be spread over district, intermediate and village panchayats? In the latter event, how should the spread take place? These and innumerable other questions need to be discussed and answers found, preferably for statewide application. Karnataka introduced a state development council (defunct at present) composed of the chief minister and chairpersons of zilla parishads. West Bengal has before it a proposal to set up an inter-zilla council, hopefully more effective than the inter-state council at the national level. State councils such as these would be the right forums for basic questions pertaining to instrumentalities to be discussed and settled.

Postscript

State level politicians and state bureaucracies are generally regarded as the main obstacles in the way of decentralised governance. It makes little sense for state bureaucracies, at least, to want to stay in the line of fire any longer.

At a deeper level, the real villains are feudalism and patriarchy. So long as these remain the organising principles of rural society, little good can be expected from self-governing panchayats. For, they will only give more power to those who are already powerful in social and economic terms. Control over the instrumentalities of self-government will further strengthen their hands. 'Out' groups of one kind or another, especially the poor and women, may well come to feel the weight of oppression more than before. For them, decentralised governance could turn out to be a curse rather than a blessing.

Consequently, it is of the utmost importance that concerted measures be taken by the states to break the hold of feudal and patriarchal forces, Unless this is done side by side with decentralisation, power will stay with the few and not pass to the people. Not for nothing did West Bengal's programme of rural resurgence have the two prongs of land reform and panchayats.

This postscript is offered as a warning to those who believe that administrative reform by itself holds the master-key to the success of self-government at the third stratum. It is certainly necessary, but by no means sufficient.

[Paper presented by the author at the National Conference on 'Interface between Officials and Elected Representatives in Panchayats' at Institute of Social Sciences, New Delhi, on November 8, 1993.]

NGOs and Women's Empowerment

Dolly Arora

Women and Wasteland Development in India edited by Andrea M Singh and Neera Burra; Sage Publications, New Delhi, 1993; pp 336, Rs 295.

DEVELOPMENT discourse underwent three major shifts in accent in the decade of 80s, reflecting in, one, an increased concern for the protection of environment; two, an emphasis on people's participation, especially in the protection, management and regeneration of natural resources; and, three, the incorporation of gender concerns as an important element of development concerns. The growing interest of international agencies, non-governmental organisations and donor agencies as well as the Indian state in programmes of wasteland development on the one hand and increasing involvement of women in these programmes on the other both manifests this discursive transformation and creates further discursive space for subsequent policy actions and expectations. It is essentially in this context that one can understand the various projects on women and wasteland development being undertaken by several non-governmental organisations in specific local settings.

The book under review, a collection of papers prepared for the 'National Technical Workshop on Women and Wasteland Development' organised by the International Labour Organisation in 1991, is primarily an analysis of the experiences of some 20 NGOs engaged in involving women in wasteland development in nearly eight states of India. Besides, two detailed case studies of NGOs—People's Education and Development Organisation (PEDO) in Rajasthan and Social Action with Rural and Tribal Inhabitants of India (SARTHI) in Gujarat—by Madhu Sarin and Chandrika Sharma, and by Madhu Sarin and Renu Khanna, respectively, there is a comparative study of 10 Forest Protecton Committees in West Bengal by Philip Viegas and Geeta Menon. Vasudha Dhagamwar and Enakshi Ganguli Thukral examine the legal issues involved in respect of women's participation in wasteland development in the light of experiences of Self-Employed Women's Association (SEWA), and to some extent Vikram Sarabhai Centre for Science and Technology (VIKSAT) in Gujarat, while Neera Burra's comparative analysis of the experiences of about 20 NGOs looks into the relevance of caste, class, tribe and gender in shaping the limits and possibilities of involving women in wasteland development programmes. The first paper in the volume, by Martha Alter Chen, attempts to provide a framework for gender-based wasteland development planning which, she feels, can be used as a tool for designing, implementing and evaluating the projects which seek to involve women in wasteland development. The last one by N C Saxena, however, differs from others in terms of its emphasis on the need to adopt a macro-perspective towards the problems of poor, including women, and to introduce policy changes (such as changing the nature of species planted by social forestry projects from timber-oriented to usufruct-based). Except for him, all other contributors to this volume not only focus on the activities of NGOs, they also consider NGOs extremely important for the participation of women in wasteland development. The conclusions of the workshop, listed at the end of the book, seek to create space for NGOs both as a link between state and women and as a source of support to them.

All contributors to this book admit the need for involving women in wasteland development. Not because women are instinctively closer to nature, but because they suffer ecological degradation most and afforestation projects which are not planned around women's schedules and needs often deny them rights which they enjoyed before the project started—women's rights to grazing or foraging can be denied through conversion of common lands into woodlots to which access is restricted or closed, and women may lose access to private farms for fodder and lops or tops as a result of monoculture plantations on private lands (Chen: 42). It is not right to mythologise women's relations with nature, argues Burra. The case for gender specificity of wasteland development programmes rests, in her view, on the reality of development programmes and women as a sub-group deserve special attention to improve their position in the family and in the economy (Burra: 273).

Women's participation in wasteland development varies not only in terms of the presence or absence of NGOs in the area (as in the study of Viegas and Menon) but also in terms of the approach of NGOs (as in the study of Burra) and in terms of the socio-cultural context (as evident in the case studies of PEDO and SARTHI). In some cases, women's participation did not involve more than being paid wages for their labour in plantation; they were not consulted in the design, conception or implementation of the project, and all decisions were taken by personnel technically qualified in agriculture. In some other cases, interest was shown towards mobilisation and organisation processes, and women were encouraged to form groups and take part in the decision-making activity itself, as in the case of PEDO and SARTHI. Some groups have local leaders who operate closely with the people, others are urban and operate through some local staff. Some try to help women meet their subsistence needs, others are keen to strengthen their linkages with the market. Some operate with clear guidelines from donors, others enjoy relatively more discretion and are open to demands from the women concerned. After reading through such detailed accounts of differences in the approach as well as performance of NGOs, one feels convinced that the existence of NGOs by itself does not mean much to the reality of women and wasteland development. Yet, most contributors to this book end up suggesting just the opposite, pleading for recognising the significance of NGOs in promoting women's participation in wasteland development!

The case for NGOs is made on various grounds: 'ordinary, poor, illiterate women' would not have the resources or experiences to deal directly with panchayats, bureaucracies, governments and law courts (p 18); despite their roles as primary collectors, women have limited legal or traditional property rights even in CPRs and cannot fight the legal battles on their own (p 241); and 'the culture of silence' inhibits women in taking part in decision-making (p 204). NGOs, it is suggested, can motivate women to organise and take part in wasteland development or forest protection and in the process strengthen themselves; NGOs can liaise with governmental authorities and pick up the legal gauntlet on behalf of the village women; and NGOs can educate, motivate and orient people towards forest protection. For various reasons, thus, NGOs are assigned an important role in respect of women's participation in wasteland development by most contributors in this volume. The argument appears very logical and valid, especially when it is accompanied with

empirical evidence from diverse contexts. The trouble, however, starts when one looks at the manner in which the evidence generated by the contributors has been overstretched at some ends and undermined at others—the conclusions of the workshop not only indicate this biased interpretation of experiences from the field but also how some significant questions have not been raised at all.

The detailed accounts of participatory processes and empowerment activities promoted by groups like PEDO and SARTHI, for instance, may give one the impression of women actually being empowered. Yet, one also knows from the accounts themselves that when faced with resistance from men, these NGOs took a compromising stand and tried to go only as far as men would permit. One does not really feel convinced if such empowerment can take women very far in terms of their claims to an egalitarian social and economic order, especially when the exploitative structures of patriarchy are accepted not as targets but confines of such empowerment. Further, despite all talk of empowerment, and of women's in-depth knowledge and know-how about the properties and uses of various biomass species, their capacity to differentiate species, identify varieties of trees, bushes, shrubs, grasses and medicinal herbs, most NGOs place far greater faith in modern technologies and make efforts to transfer it to women in project areas through training programmes—if this does not reflect any contempt for women's own knowledge and technologies controlled by them, this also does not suggest any commitment towards its remaining so. Such bias underlies the various programmes of technical training and assistance provided by most NGOs. Often, the apparent autonomy of decisions is already conditioned in the process of training, thereby effectively reducing participation to its instrumental relevance as serving the ends of project promoters. The real implications of training programmes need to be studied more closely and their implications for empowerment or disempowerment examined with care before these are attributed an increased role by either NGOs or state. Further, the contributors talk of empowerment without relating it to the issue of autonomy or reduced dependence on outside support. In fact, in most cases outside economic and technical support increases manifold as a consequence of the entry of outside NGOs. Can such increased dependence be interpreted as empowerment? These and several other questions are not paid the attention they deserve while discussing the relationship of NGOs to women's participation and empowerment.

The book undoubtedly provides interesting insights into the dynamics of participation and non-participation in several micro-contexts. The major limitation of the book, however, emanates from this very context. Meant as it was to take stock of various projects on women and wasteland development being undertaken by NGOs in various parts of the country, the analysis is primarily a comparative study of the approaches and performance of several NGOs in respect of women and wasteland development. It emanates from a belief in the project approach to development. Read from the viewpoint of those engaged in executing development projects in specific locations it may appear to offer a wealth of useful suggestions for improving project performance. But when evaluated from the perspective of social scientists and policy researchers, it needs to be put in a broader context. For one thing, one needs to be careful in defining and evaluating the meaning of such processes as participation. Can we, for instance, capture the essence and extent of participation without referring to the extent of autonomy or capacity for effectively utilising the local knowledge system or rejecting outside technical support which is implied in it? For another, one has to qualify the possibilities of development—of women or wastelands—by placing it in the overall context of problems and possibilities. The limits of making any significant difference to the overall situation through a limited number of development projects undertaken by NGOs, however sincere they may be, have to be realised. For, as long as the negative fall-outs of other general policies continue pouring into the lives of women, and as long as the dominant structures of their exploitation, as women and as poor women, go unchallenged, the possibility of development projects changing the conditions of their life will remain very weak. Some relatively more successful projects may provide a basis for hope, and may be seen as models to be replicated. But the limits of replicability emerge not only from the peculiarities of each local context; the limits of resources which can be committed themselves are also daunting. It is this which provides reasons to look for alternatives, not only to project approach to development, but also to development which is dependent on outside support, and on the honesty, commitment or even sensitivity of such support. Even if one admits the success of some NGOs in specific contexts, it is not possible to overlook the negative implications this may have for other areas because of their ability to divert resources to their own area of operation. The meaning of successful projects of NGOs therefore needs to be read without overlooking the implications and limitations which remain unstated, though seldom unfelt by those not covered.

Carpets of Ugly Design

Karin Kapadia

Child Labour in the Carpet Industry: A Status Report by S Vijayagopalan; **NCAER**, New Delhi, 1993; pp 64, Rs 120.

THIS short book is based on a survey of 500 children working in the carpet industry in the Bhadohi-Mirzapur belt of Uttar Pradesh. It has a curious provenance, having been sponsored by the Development Commissioner (Handicrafts), Government of India. Rather tellingly, the front flap states, "Unless and until the problems of child labour are tackled on a war footing, not only the Indian carpet export trade will be in jeopardy, but every other export-oriented handicraft item will be suspect in the mind of the importers". However, though concern for "the mind of the importer" may have inspired this study, any study of child labour is welcome at any time, given the great importance of the issue—and the equally great neglect it has suffered.

The most interesting findings of the survey (conducted by the National Council of Applied Economic Research, who have published the book) are as follows: (1) Child labour is of two, significantly differernt, kinds: family labour and paid labour. (2) While family labour may be countenanced (for various reasons), there is serious exploitation of children who are paid labourers. (3) This is particularly because these children come as migrant labour (brought by agents) from impoverished rural areas in Bihar, eastern Uttar Pradesh and Madhya Pradesh and are in the care—or, rather lack of care—of their employers. (4) Far from their parents, and at the mercy of their employers, these children have poor health, are badly paid and "appear to be famished" (p 56); they suffer frequent cuts and injuries in their work and 15.4 per cent have tuberculosis. In this connection the author states, "The utter lack of concern by the employer about the seriousness of the health problems faced by the carpet children can be gauged by the fact that 87.7 per cent of the children resorted to self-medication or home remedies" (p 56).

Further, these children are bonded labourers: their parents have been given 'lump sum payments' of Rs 2,300 to Rs 2,800 per child. Here the author's comments are very significant: "Such [bonded] children are required to work for a specified number of years, mutually agreed upon by the parents and the agents and in the event of breaking the arrangement the parents *have to repay the funds with interest*. Parents living below the poverty line who cannot even feed their children, *can never repay the advance amount along with the usurious rates of interest*. As a consequence, children are forced to work for the employers for long periods" (pp 41, 43; italics added). The wicked ingenuity evidenced here is remarkable—parents are trapped as much as their children are; they *cannot* withdraw their children even if they want to. Given that these parents are extremely poor and, as the author himself repeatedly states, are "forced" to send their children for bonded work, it is consequently surprising to find him observe (after describing the "lack of concern of employers"), "The parents of the carpet children appear to be equally unconcerned about their wards. As many as 67 per cent of the working children complained that their parents never visited or corresponded with them" (pp 56, 59). Is it not likely that very poor parents would not have the means to visit their children—and are illiterate?

The author implies that parents and children do not *like* the kind of education that is on offer in rural schools and that this is why children work instead of going to school: he says, "the present curriculum [is perceived] as being difficult, expensive and futile" (p 61) and suggests that "it is up to the government to evolve a suitable educational system to suit the needs and aspirations of children who are normally from the weaker sections of society" (p 61), recommending "a vocational training-cum-general education in schools free of cost" (p 61)

With due respect, two points can perhaps be made here. Firstly, is it not possible that it is not the *cost* of education that dissuades parents from sending their children to school, but, rather, dire poverty which makes it essential to *increase* family income through paid child labour? The author states that in Tamil Nadu, for instance, "free mid-day meals, uniforms and books have been successful in attracting children to schools" (p 63). While this may be partially true it must be pointed out that R Vidyasagar has noted that the estimate that there are 10 lakh working children below the age of 15 in Tamil Nadu is "only the tip of the iceberg"—the real number is likely to be around four million [Vidyasagar 1992: 29]. In short, there are huge numbers of child labourers even in Tamil Nadu—because of rural poverty.

Secondly, is it not possible that both parents and children show considerable wisdom in staying far away from rural schools, given that the standard of education on offer is often appalling? Field studies have found that the education provided is often worse than useless—I found that many children who had completed fifth standard (in rural Tamil Nadu) were entirely illiterate [Kapadia forthcoming] while Jean Dreze and Mrinalini Saran too have noted (in rural Uttar Pradesh) that "the quality of [school] services is deplorably low" [Dreze and Saran 1993: 74]. In such a situation, what is the point of sending your children to school? Further, to suggest that 'vocational schools' can solve the problem, is to not recognise that many parents are too poor to send their children to *any* school: the family cannot survive without the children's labour. This is not to say that we should not be attempting to 'eradicate' child labour—but, rather, that to really do so, one has to recognise that it is the direct fruit of rural poverty. Until rural poverty is seriously tackled, child labour is certainly not going to go away.

Some Aspects of Role of State in Singapore

Mukul G Asher

This paper analyses selected aspects of the role of the state in Singapore. Over the last three decades, Singapore has been able to combine good macro-economic performance and good social and demographic indicators with authoritarian policy and corporatist management. Singapore has used market as an instrument rather than as a mechanism.

The paper discusses the issue of economic boundaries of the state in Section II; budgetary policy in Section III; role of public enterprises which has been extensive in Singapore in Section IV; and the Central Provident Fund (CPF), which has become an important socio-economic institution, in Section V.

The paper cautions that unless certain pre-conditions are met, pursual of policies and style of management similar to that of Singapore by others could lead to very different results. Therefore, great care must be taken in drawing lessons concerning the role of the state from Singapore's experience. The paper suggests that rapid aging of the population combined with affluence would pose a formidable challenge to the policy-makers, and meeting it may require significant modifications to the present role of the state in Singapore.

I
Introduction

AFTER nearly two and a half decades of almost uninterrupted rapid economic growth, Singapore is now an affluent society, with per capita GNP of US $ 14,210 in 1991.[1] In this remarkable economic performance, the Singapore state[2] has played a crucial role. Two major economic functions performed by Singapore are as a production base for selected goods and services, such as oil refining, disk drives, financial services, and transportation services; and as a middleman for the region and beyond. Its economy is dominated by the multinational companies (MNCs),[3] and by the state-owned enterprises (SOEs), which in Singapore's case may be divided into statutory boards and government-linked companies (GLCs).[4] The state ownership of land increased from 44 per cent of total land in 1960 to 76.2 per cent in 1985 [Lim et al 1988: 101]. The land in Singapore is usually leased for a long period, but its ownership is retained with the state. Since the early 1990s, Singapore has been making a concerted drive to regionalise its economy by developing investment and other economic relations in the region.[5] Singapore also has high saving and investment rates;[6] and high and persistent structural surpluses in the budget.[7] In Singapore, economic, social and related information is regarded as a strategic resource at the state's disposal rather than a public good. In the remarkable economic performance and in bringing about the present structure and features of the economy, state's role has been vital. The state has acted as strategist, planner, regulator or enforcer, manager and administrator, entrepreneur, social engineer, and a direct participant in economic activities. In the process it has either set up or has undertaken overseeing responsibilities relating to cultural, social, political and economic organisations and institutions.

As Singapore has till now provided a viable combination of high growth, good social and demographic indicators such as educational attainment,[8] home ownership,[9] and life expectancy,[10] and authoritarian polity, with corporatist management,[11] its experience is of particular interest to those countries which give improving economic performance priority over other concerns such as political reform.

Singapore has used foreign models, at times explicitly to support particular socio-economic strategy adopted. Margolin divides the ideological and intellectual transformation of Singapore into three periods since the 1950s These are: "the 'revolutionary', Third Worldist one of the opposition years; the social-democratic one of the 1960s; and the 'Nippo-Swiss' one of the last two decades" (1993: 85). Each successive model is more and more economy-centred, and so has been the case with the Singapore society as a whole [Margolin 1993. 85].

A necessary but clearly not sufficient condition for an economy-centred society is near-monopoly of politics and political processes by the governing elite, and depoliticisation of the rest of the population and of issues. It also requires population which is willing to accept such a focus An important determinant of this willingness is the ability to provide rapidly rising living standards, even to the elderly who are no longer participating in the labour force. Thus, authority, both political and moral, of the elites and legitimacy of the government in an economy-centred society are inextricably linked with the ability to provide rapidly rising living standards.

This paper examines the role of the state in Singapore in selected areas, and suggests possible implications for other countries. It is organised as follows. Section II discusses the issue of economic boundaries of the state.[12] In the Singapore context, it concerns the manner in which market has been used; and steps taken by the Singapore government to ensure effectiveness of its style of economic management. Budgetary or fiscal policy represents for any government an important instrument to influence aggregate economic activity, to assign priorities in government expenditure, and to raise resources through tax, non-tax and borrowing sources to finance government expenditure. The discussion in Section III of budgetary policy also briefly touches on the role of fiscal incentives in Singapore. A brief discussion of the role of public enterprises including privatisation is provided in Section IV. One of the important socio-economic institutions in Singapore is its national provident fund, called the Central Provident Fund (CPF). Brief comments are offered about the CPF in Section V. The final section provides the concluding observations.

II
Economic Boundaries of the State

In the conventional economic literature, market and government represent two alternatives to economic organisation. The balance between the two has undergone significant changes over time. Before the great depression of the 1930s, faith in market mechanism and in Adam Smith's 'invisible hand' under which individuals pursuing their own self-interest were pictured as achieving the overall maximum well-being of the society was extremely high. But the great depression of the 1930s revealed in a dramatic man-

her failure of macro-economic co-ordination; and the second world war demonstrated possibilities of effective government planning and intervention. This, combined with the importance attached to the goals of distributive justice and of positive freedom, designed to improve the capacity of individuals to expand consumption demands, meant that role of government expanded significantly. But such expansion led in due course to intensive examination of the concept of government failure. Reasons for such failure may be summarised as follows: (i) consequences of many government actions are extremely complicated and difficult to foresee; (ii) government may promulgate policy measures, but it has only a limited control over relevant variables; (iii) there is a gap between legislation and intention, and between those who set broad policy framework on the one hand and those who frame detailed rules and procedures and who actually implement them on a day to day basis on the other; and (iv) different interest groups may vie with each other in a society, and this may complicate the task of defining what is overall public interest.

In addition to the failure in macro-economic co-ordination noted above, other reasons for market failure include monopoly power (when buyers and sellers are price-makers rather than price-takers and entry and exit barriers are high), externalities (when actions by an individual or a firm affect cost or utility functions of others but these do not get reflected in the market); public goods (when marginal social cost of an additional person consuming a good is zero and when those who do not pay cannot be excluded because of technical infeasibility or high cost); and asymmetric information (when either a buyer or a seller has markedly more relevant information in a transaction). However, as Weimer and Vining (1992: 76) have noted, "market failure is most likely in situations where information asymmetry occurs in combination with public good problems in secondary markets".

In addition to the above types of market failure, reservations about the efficiency of capital and insurance markets, and concern for values other than efficiency such as equity, including income and consumption distribution, freedom and human dignity provide the analytical rationale for the role of government in the economy.

Thus, both market and government are imperfect alternatives. Indeed, as Helm has noted, "... economic theory does not provide any evidence to support a general preference *either* for markets *or* for planning" (1989: 42-43, emphasis in the original). A pragmatic approach would be to assess which of the two failures is greater in a specific situation and context, and to then decide on whether market or government is more appropriate. If government is chosen, it is also necessary to design the instruments of intervention in a careful manner, taking into account sources of government failure noted earlier.

While the emphasis in the economics literature has been on market and government (or planning) as alternative mechanisms, economic success achieved by Japan and other east and south-east Asian countries, including Singapore, which have borrowed heavily from Japanese methods of economic and to a lesser extent political organisation and management, has raised many complex issues regarding market and government. Friedland has described the Japanese policies as favouring "... producer over consumers, bureaucratic control over political debate and stability over innovation" (1993: 12) Indeed, the above policies, and the role of the bureaucracy in guiding markets have led some analysts such as Clyde Prestowitz Jr and Chalmers Johnson to argue that Japanese capitalism is different in fundamental ways than the western capitalism, and that international economic policies of the US and other industrial countries should take them into account [Sterngold 1993]. Sterngold quotes Yasushi Mieno, governor of Bank of Japan, as stating that western nations need to study the Japanese model of economic organisation and that lessons from the Japanese model should be applied by the multilateral institutions in their advice on development strategy (1993).

The main difference between the conventional economic theory and the western view on the one hand and that of Japan, Singapore and other like-minded countries on the other is that in the latter market is used an instrument of policies and goals already set as in these countries belief in the idea of invisible hand as a mechanism is quite weak. As a result, markets in these countries are not free in the western sense. Thus, in Singapore extensive government landholding noted earlier, combined with extensive public housing programme have resulted in government being a dominant player in the real estate and property market. Similarly, government decides on the number of certificates of entitlement (COEs) to be issued in each period; but then uses auction mechanism to allocate them. Government also decides on the amount of levies, overall number, and the source for foreign labour, but then allows this labour to be allocated according to those who are prepared to pay the resulting price. Thus, market is used as an instrument because it is regarded as more economical in information and administrative costs, but not as a mechanism. It should be noted that such use of the market does not carry with it normative efficiency implications which are normally associated with market mechanism leading to Pareto efficiency, under which it is not possible to make someone better off without making others worse off. The policy-makers in Singapore however did ensure that state intervention did not ignore the disciplining functions of the market. Moreover, state intervention did attempt to reduce uncertainty and risks of business through overall policy stability while being flexible about tactics; by fostering optimistic psychology in individuals and by skilfully projecting Singapore and the region among investors, opinion-makers and others.

Use of market as an instrument also assumes that allocation function can be separated from the distribution function. When the use of market as an instrument is combined with corporatism, almost no area of individual's life is theoretically immune from the purview of the government. This is evident in the role state has played in Singapore, which has touched lives of citizens in many diverse areas.

It appears that Singapore government recognised at the very beginning that for its method of economic organisation and management to function effectively, efficiency-conscious, and result-oriented bureaucracy; very high priority to business interests and minimisation or elimination of illegal payments to those in positions of power within Singapore, would be indispensable. Indeed, those entities which are unable to match these requirements may find that Singapore-type of economic organisation and management yield very different results. Thus, changing the attitudes and behaviour of the civil servants, so that these are consistent with the ruling party's objectives and strategies has been a priority ever since the People's Action Party (PAP) formed the first government of the State of Singapore in 1959. On September 16, 1963, Singapore became a constituent state of Malaysia. It became a sovereign, independent nation on August 9, 1965. Through various measures and policies relating to personnel, training, adoption of information technology (IT) in government, review of procedures, rules, regulations, and others, the government has lowered compliance costs, both psychic and financial, of day to day transactions of general public with the governmental machinery. The government has also taken steps to encourage flexibility and responsiveness and adaptability to changing market forces and other factors by the governmental organisations. The government has set up Corrupt Practices Investigation Bureau (CPIB) under the prime minister's office (PMO). As Ow has noted, "... the CPIB has immense

powers and may carry out investigations of allegations of corruption by civil servants, other public sector employees, Members of Parliament and Ministers. The director of CPIB reports directly to the Prime Minister' (1986: 247-48).

The planning process in Singapore centres around a broad indicative plan and several sector-specific physical and human resource development plans. Currently applicable indicative plan is the Strategic Economic Plan (SEP) which identifies for targeting 13 industry clusters in which Singapore should develop international competitiveness, and which aims to turn Singapore into an innovation-driven economy by the year 2030, with substantial command over economic decisions exercised from the headquarters of the domestic and foreign firms located in Singapore [Ministry of Trade and Industry: 1991]. The sectoral plans include Urban Redevelopment Authority's Concept Plan, Master Plan for Singapore's physical development, National Technology Plan, National Automation Master Plan, and others.

The following characteristics of Singapore's planning process may be noted. First, plans are constantly reviewed and when necessary updated. Second, vision and objectives of the plan are clearly articulated, and then communicated to the concerned parties, including the general public. Third, clear lines of accountability and responsibility are assigned. Fourth, implementation details as well as results are emphasised. Project planning and execution is among the important strengths of Singapore.

III
Budgetary Policy

Budgetary accounts of the Singapore government are organised around various funds. A distinction is made between the current or operating expenditure and capital or development expenditure. The budgetary system emphasises efficiency objective, and as a consequence, relationship between financial and other inputs for a given activity or a programme on the one hand and resulting output or performance on the other is stressed. The published budgetary amounts are based on a mixture of cash, accrual, opportunity cost, and notional cost elements, whose combination may vary from year to year. As a result, budgetary analysis needs to be undertaken with care.

Tax Policy

It may be useful to begin the discussion of tax policy by briefly summarising the relevant features of Singapore's revenue system. Data for the fiscal year 1992-93 provided in Table 1 form the basis for the summary provided below.

(1) Total revenue to GDP ratio at 34.5 per cent in 1992-93 is fairly high, particularly when compared to government expenditure 20.1 (per cent of GDP in 1992-93).
(2) Tax revenue (at 18.3 per cent of GDP) accounts for 53.4 per cent of total revenue. Unlike the revenue to GDP ratio, tax to GDP ratio for Singapore is substantially lower than the average for the Organisation of Economic Co-operation and Development (OECD) countries (38.8 per cent of GDP in 1990).[11]

Thus, the reliance on non-tax revenue and capital revenue combined is exceptionally high (46.8 per cent in 1992-93). This has three main implications. First, the government has considerable flexibility in raising revenue. In particular, it does not need to rely exclusively on taxes if additional revenue is needed. Second in analysing the economic effects of revenue structure, such as on stabilisation, the cost of doing business, and incentives to save and to work, exclusive attention to tax revenue is likely to be inadequate. The effects of various regulatory and non-regulatory charges, incidence of land acquisition policy,[14] sale (essentially long-term lease) of land, pricing policies of statutory boards, and sources of and cost paid to generate investible funds, all need to be taken into account in analysing the economic effects. The above suggests that budget balance (or changes in it) is even less likely to be an useful indicator of the overall direction of fiscal policy than is normally the case. Third, since a major portion of income is from capital income and investment income, and since a substantial part of the investment income is from investments abroad, conservative management of investment portfolio and continued health of the current international financial system are vital for Singapore's fiscal health.

Persistent government budget surpluses has meant a build-up of assets of the Singapore government. The assets have increased from $ 1,07,300 million on March 31, 1992, to an estimated $ 1,21,500 million on March 31, 1993 (1993 Budget Document, p 85). These assets may be contrasted with the estimated total expenditure and operating revenue for fiscal year (April-March) 1993 of $ 15,500 mil-

Table 1: Singapore—Revenue Structure, FY1992-93[a]

Category	Amount (Million $)	As a Per Cent of Total Revenue	As a Per Cent of Tax Revenue	As a Per Cent of GDP[b]
1 Total revenue	25,832.4	100.0	188.1	34.5
2 Current revenue	20,116 9	77.9	146.5	26.5
3 Capital revenue	5,715.5	22.1	41.6	7.6
3.1 Sales (lease) of land	4,526.4	17.5	33.0	6.0
2 Current revenue	20,116.9	77.9	146.5	26.8
4 Tax revenue	13,731.0	53.2	100.0	18.3
5 Non-tax revenue	6,385.9	24.7	46.5	8.5
5.1 Fees and charges	2,045.8	7.9	14.9	2.7
5.2 Investment income	3,337 2[c]	12.9	24.3	4.4
4 Tax revenue	13,731.0	53.2	100.0	18.3
4.1 Income tax	6,738.0	26.1	49.1	9.0
4.1.1 Individual income tax[d]	1,714.1	6.6	12.5	2.3
4.1.2 Company income tax[e]	5,023.9	19.4	36.6	6.7
4.2 Asset taxes[f]	1,436.1	5.6	10.5	1.9
4.3 Import duties	709.0	2.7	5.2	0.9
4.4 Motor vehicles taxes	1,548.0	6.0	11.3	2.1
4.5 Excise and related taxes	1,593.3	6.2	11.6	2.1
4.6 Stamp duties	671.7	2.6	4.9	0.9
4.7 Other taxes[g]	1,034.8	4.0	7.5	2.3

Identities: Total Revenue = Current Revenue + Capital Revenue.
Current Revenue = Tax Revenue + Non-Tax Revenue

Notes. a Based on revised estimates.
b GDP in 1992 was $ 74,974.5 million.
c No figures have been provided for Singapore Technologies Holdings.
d Estimated from the assessed income tax to individuals divided by total income tax assessed in 1991. The ratio in that year was 28.1. From Income Tax revenue, contribution by the Statutory Boards of $ 638.1 million is excluded for calculating the individual income tax revenue.
e Includes contributions by the Statutory Boards.
f Includes real estate taxes and estate duties.
g Includes levy on domestic maids, foreign workers levy and certain other taxes.

Sources: Calculated from the Republic of Singapore, the Budget for the Financial Year 1993-94, pp 55, 73; and Republic of Singapore, Department of Statistics, *Yearbook of Singapore 1992*, Table 4.3, p 81.

lion and $ 17,200 million respectively. The 1993 assets are equivalent to 162.1 per cent of the 1992 GDP of Singapore. The official foreign reserves have increased from $ 17,917.9 million in 1982 to $ 65,788.4 in 1992 [Republic of Singapore, Department of Statistics 1993: 223, Table 12.4]. Accumulated balances in the national provident fund, called the Central Provident Fund (CPF) amounted to $ 51,526.9 million as at end 1992 [Republic of Singapore, Department of Statistics 1993: 233, Table 12.15].

While the above are gross and not net figures, (public debt as at end 1992 was $ 67,255 million), they do demonstrate the point that conservative management of such large balances is vital for future economic and social well being of the residents of the country.

An important and potentially far-reaching institutional development in this context is the Elected Presidency Law (EPL) which came into effect on November 30, 1991. Qualifications needed to be nominated to contest for presidency are set in such a way that at present only several hundred individuals can potentially qualify. There are two main fiscal powers under the EPL. The first gives the president the right to veto the annual budgets of the government statutory boards and key government companies if they draw on reserves accumulated during the terms of previous governments (definition of reserves is at present somewhat ambiguous). The president also has the power to scrutinise and if necessary veto any large item of expenditure by a statutory board or a government company. The second fiscal power allows the president to veto key public service appointments, including those concerned with fiscal aspects

The EPL does not forbid the use of reserves, but requires the concurrence of the president before this can be done. This suggests that the president does not have any direct oversight powers over the level or composition of the public sector, though the president can still influence it through the veto powers. Nevertheless, the EPL is designed to prevent drastic departures from the present public sector arrangements, including almost exclusive reliance on the national provident fund mechanism to provide social security.

(3) In 1992-93, taxes on income accounted for 49.1 per cent of total tax revenue. The individual income tax however accounted for only 12.5 of the total tax revenue. This is in sharp contrast to the OECD countries where it accounts for about four-fifths of the total. As a part of the tax burden of company income taxes is usually assumed to be shifted forward to consumers, and given Singapore's high income status, the role of taxes on income, particularly of individual income tax, cannot be regarded as being unduly high.

(4) Motor vehicle taxes accounted for 11.3 per cent of total tax revenue in 1992-93. If other types of taxes dependent on motor vehicles, such as petroleum excises, and motor vehicle related fees and charges such as for Certificate of Entitlement (COE), essentially a licence to purchase a motor vehicle, are included, then the share of motor vehicle taxes could increase to around one-fourth of the total tax revenue. Excises are levied on traditional items and accounted for 11.6 per cent of tax revenue in 1992-93.

(5) Among the 'others' category which accounted for 7.5 per cent of total tax revenue in 1992-93, foreign workers levy is quite significant. In this case, government not only sets the overall quota, but also decides on the share of workers to be sourced from various countries, and the amount of levies. At the lower end of the wage scale, such as to construction workers and maids, it is likely that foreign workers' levy according to the government exceeds the wages paid to the foreign workers; and it is they who bear most of the burden of the levy. Pricing is used to allocate labour, but control is exercised on both the demand and the supply side Amount spent on services provided to foreign workers is not provided in the budget documents, but it is unlikely to be significant.

(6) Singapore does not levy any export taxes. The import duties are largely confined to liquor and tobacco products, motor vehicles, and others such as textiles, cosmetics and chocolates. Thus, unlike in many countries, import duties play only a marginal role in the revenue structure and in the system of fiscal incentives.

(7) Singapore does not levy capital gains taxes. The only tax on wealth is estate duties whose revenue importance is negligible. Some of the east Asian countries such as Taiwan and South Korea have in recent years attempted to levy capital gains taxes to curb asset inflation in stock and real estate markets. Whether similar measures will be taken in Singapore if the asset inflation persists remains to be seen.

Introduction of the Goods and Services Tax (GST): The GST is to be introduced from April 1, 1994 at a rate of 3 per cent.[15] The GST is a type of value added tax (VAT) covering all aspects of production and distribution. However, because of the high exemption level (those with turnover of S$ 1 million or less are exempt from the tax, but as a result they cannot claim refunds on input taxes paid), only 20 per cent of businesses are expected to be covered under the GST. This would turn GST into a complicated excise tax with cascading-type features

The main official rationale for the GST is that its introduction will permit reductions in company and individual tax rates, thus helping to keep its tax system internationally competitive.

The introduction of the GST is to coincide with various other changes in the tax system. Among the most important are the reduction in company income tax from 30 per cent to 27 per cent; and in the top income tax rate from 33 per cent to 30 per cent, both effective from the year of assessment 1994. Other tax measures include increase in personal relief from S $ 2,000 to $ 3,000; and an annual sliding-scale rebate on income tax. The above changes in income tax, according to the government estimates, are expected to reduce the proportion of households liable to income tax from the present 90 per cent to 50 per cent. As Singapore has used income tax for a variety of socio-economic objectives such as providing incentives for qualified women to have more children; to take care of the aged parents; for gifts to approved charities; and to in effect differentiate in income tax rates between citizens, permanent residents and others; lower coverage of income tax as well as lowering of rates will reduce their effectiveness.

The GST is expected to increase the share of taxes on domestic goods and services, while reducing the share of income tax. This is expected to move the overall tax system in the direction of regressivity. It is also expected to increase the administration and compliance costs of the tax system.

The GST will also have important implications for social security financing in Singapore, as noted in Section V.

With the GST, Singapore now has two broad-based taxes, namely income tax and consumption tax. Since both have the potential to generate significant amounts of revenue, the government is well placed to meet increased expenditure, if a policy decision is made to do so.

Role of Fiscal Incentives

As may be expected from Singapore's economic strategy and from the role of the state, Singapore has pursued an activist fiscal incentive policy.[16] In addition to the incentives contained in the Economic Expansion Incentives (Relief from Income Tax) Act, there are incentives provided in the Income Tax Act. Certain tax incentives also exist in the double tax treaties which Singapore has negotiated with other countries, particularly in treaties with the capital exporting countries. While Singapore continues to be a significant importer of capital, in recent years it has also been exporting capital first in the

passive form and increasingly in the form of direct foreign investment. As a result, it faces a complex task in double tax treaty negotiations, particularly if it is to adhere to the most favoured nation clause in the OECD model for such a treaty. Singapore has entered into investment guarantees agreements with countries such as the US, Germany, UK, People's Republic of China, and Sri Lanka. Such a treaty with India is being considered. In addition to the Economic Development Board (EDB), the Trade Development Board (TDB), Monetary Authority of Singapore (MAS), the National Computer Board (NCB), and other bodies have become active in granting and monitoring incentives during the 1980s. In recent years, there has been a shift towards promoting service related activities at the margin. There are also many important types of incentives which have not been written into the law, but which are expressed by the relevant authorities as administrative or policy decisions. Thus significant discretionary power is exercise in Singapore in granting of fiscal incentives.

Rules and regulations governing the entry and operations of foreign enterprises, with some exceptions such as retail domestic banking, have been relatively liberal once objectives of significant contribution to the economy and consistency with the economic strategy have been satisfied. Repatriation of capital, and remittance of profits and other capital income are allowed with no undue restrictions. There are no local content, technology transfer or other such requirements. Borrowing by foreign firms from domestic sources also faces only minor restrictions. Foreign labour flow is however regulated.

It is important to recognise that Singapore government has attempted, quite successfully, to regard fiscal incentives as only a part of overall business environment; and has regarded incentives as signals to investors as to where government's energies and policies will be focused. It has also had an effective pre as well as post incentive evaluation programme. Thus, while incentives are quite generous on paper, in practice stringent criteria are applied in granting them, particularly whether the enterprise granted such incentives will help the economy to reach a higher level at the margin. Post-evaluation of incentives has meant effective sunset types of policies under which incentives are withdrawn after a certain date; and new ones introduced in response to perceived need for new niches.

Concerning the business environment, civil service reform has already been indicated. In addition, the following may be noted. First, the government has emphasised relevant and utilitarian investments in skills formation, particularly on technical training. This constant upgrading of technical skills has meant that Singapore can not only develop the capacity to move up the technological ladder, a move which is essential as its competitors catch up,[17] but also provides a real possibility of overcoming technological dependence implied in the overwhelming importance of foreign enterprises in the economy. Towards this end, Singapore has been providing scholarships to students from such countries as India, China and Malaysia for pursuing engineering and related technical and professional careers. There is a provision to bond these students, so that their services become available to Singapore. This talent-augmenting is one of the policies pursued to achieve the above objective. The second aspect concerns the power of the trade unions. In 1968, Singapore enacted two important labour legislations which severely circumscribed union's power to negotiate on economic issues. While the Employment Act curtailed the power of unions to negotiate fringe benefits; the Industrial Relations (Amendment) Act made matters, such as recruitment, promotion, reclassification, transfer, retrenchment and dismissal of workers, management's prerogatives, and thus not a part of bargaining with the unions [Yoshihara 1976, 32-33].

In a recent study, Asher et al conclude that fiscal incentives regimes in Singapore have enjoyed an overall success, but as number of agencies involved in initiating and implementing incentives increases, as political system matures, and as distribution coalitions take root, greater transparency, public disclosure, and accountability would need to be given greater weight (1992: 126-27). This conclusion is particularly relevant as there does not appear to be any prospect of less activist fiscal incentive regime.

Expenditure Policy

The expenditure policy of the Singapore government has the following main features. It is designed to keep the level of government expenditure low. Thus, government expenditure plus net lending has declined from 35.89 per cent of GDP in 1985-86 [IMF 1993: 475] to 22.21 per cent of GDP in 1990-91 (Table 2). Unlike in the case of revenue, 1990-91 data are used because it is the latest year for which expenditure data in the IMF format are available. Per capita government expenditure in 1990-91 was $ 5,340 (Table 2). It should be stressed that the above figures refer only to the general government sector, and only net lending and grants to statutory boards and others are included.

Second, in allocating expenditure, priority is given to defence, education and

Table 2: Singapore—Level and Composition of Government Expenditure, 1990-91

Category	Amount (Million $)	Per Capita Expenditure[a] ($)	As a Proportion of Total Expenditure Plus Net Lending	As a Proportion of GDP[b]
Aggregate Expenditure				
1 Total expenditure plus net lending	14,444	5,340	100.0	22.21
2 Total expenditure	14,223	5,258	98.5	21.87
2.1 Current expenditure	10,867	4,017	75.2	16.71
2.2 Capital expenditure	3,356	1,241	23.2	5.16
3 Net lending	221	82	1.5	0.34
Functional Expenditure[c]				
4 General public services	897	332	6.2	1.38
5 Defence and public order and safety	3,915	1,447	27.1	6.02
6 Education	2,825	1,044	19.5	4.34
7 Health	652	241	4.5	1.00
8 Social security and welfare	300	111	2.1	0.46
9 Housing and community amenities	1,121	414	7.8	1.72
10 Economic affairs and services	2,362	873	16.4	3.63
11 Interest on public debt	2,021	747	14.0	3.11
Expenditure by Economic Type[c]				
12 Expenditure on goods and services	7,193	2,659	49.8	11.06
12.1 Wages and salaries	3,780	1,397	26.2	5.81
13 Subsidies and other current transfers	1,653	611	11.4	2.54

Notes: a Based on resident population of citizens and permanent residents of 2.7051 million in 1990.
b GDP in 1990 equalled 65,024 million dollars.
c Includes net lending. Details may not add up to the total as some items have been omitted.

Sources: Calculated from IMF, *Government Finance Statistics Yearbook, 1992*, Washington, DC, IMF, 1993; Republic of Singapore, Department of Statistics, *Yearbook of Statistics, 1992*, Singapore 1993, Table 2.1, p 9.

economic services. Thus, in 1990-91, expenditure on defence and public order and safety amount to 6.02 per cent of GDP (Table 2). Even this, rather high level is understated as in Singapore males are required to do two and a half years of national service. The amount paid to them is at below market rates. The military training however is regarded by the government as an indispensable past of nation building, and in preparing individuals for facing economic realities confronting Singapore. In 1990-91, education expenditure was equal to 34 per cent of GDP, with primary and secondary education receiving the largest subsidy as a proportion of its costs. The government is to cap the subsidy for tertiary education at 75 per cent of recurrent costs. With numerous scholarships and bursaries available, affordability of education is not a major issue in Singapore. Stress on education is a part of human resource development; and it is designed to allow rapid restructuring and upgrading of the economic activities in Singapore. Expenditure on economic affairs and services equalled 3.63 per cent of GDP in 1990-91 (Table 2).

Third, expenditure on health and social security and welfare is kept low, with emphasis on individual or family provision. This is achieved by extensive government intervention on both the demand and the supply side of health care. The objective is to price health services as near to true economic cost as possible, with provision made for the most needy. As a result government's health expenditure has declined from 1.64 per cent of GDP in 1981 to 1.0 per cent in 1990-91. Whether affluence, rapid ageing, longer life spans, and commercialisation of health sector particularly evident since the mid 1980s will allow this trend to continue remains to be seen. Difficult choices between equity, efficiency, affordability, and needs and demands concerning health care lie ahead. The question of social security is discussed in Section V.

Fourth, since the late 1960s, providing affordable good quality public housing has been an important goal of Singapore government. In this the government has achieved remarkable success (see note 9). The government acquired the land at below market prices but it passed on this low land cost, until recently, to the public, while simultaneously ensuring that the Housing and Development Board (HDB) and other such bodies had management culture and expertise to build good quality housing at relatively low cost on a mass scale. The CPF scheme provided the means to the general public to purchase public housing; and the centralised nature of the scheme meant negligible default rates. It also made available enormous amount of data which could be used for social engineering and economic planning. In the first half of the 1980s when the public housing programme was expanding rapidly, net lending was an important item of expenditure (it accounted for 8.67 per cent of GDP in 1985-86). But with the programme now at a lower level, and because of revision in pricing and accounting procedures of the HDB, net lending has become much lower, accounting for only 0.34 per cent of GDP in 1990-91.

Fifth, even though government has had an overall budget surplus since 1968, and its external debt is negligible (less than 0.04 per cent of total debt in 1992) the interest expenditure in 1990-91 was equivalent to 3.11 per cent of GDP, or 14 per cent of total expenditure plus net lending (Table 2). Singapore's internal debt has increased from S$ 19,855.7 million in 1982 to S$ 67,228 million in 1992 [Republic of Singapore, Department of Statistics 1993: 254, Table 13.5]. This debt is issued in the main to satisfy the statutory requirements of the financial institutions, including of the CPF. Indeed, almost all of CPF assets of S$ 51,526.9 million in as at end 1992 were in Singapore government securities. The government in turn invests these funds at home and abroad, though the details of portfolio are not made publicly available.

Sixth, in 1990-91, wages and salaries accounted for 26.2 per cent of total expenditure plus net lending or 5.81 per cent of GDP. The government considers it essential that it is able to attract highly qualified technical and professional manpower. It is willing to provide the employees with competitive compensation package, though recent medical benefit revisions for both existing as well as new civil servants and employees of statutory boards have created some concern among them. At the same time, productivity, performance and behaviour of the civil servants are closely monitored to ensure efficiency and minimise principal-agent problems. The civil service rules are flexible enough to enable induction of individuals with necessary talent and expertise. Scholarships accompanied by service bonds are used extensively to attract and retain talent in the civil service. Corporatisation of certain government departments and divisions has been used to provide greater flexibility in personnel policies.

IV
Public Enterprises and Privatisation

As noted, public enterprises has played an extensive role in Singapore's economic development. As Tan has argued, "... since the 1960s, statutory boards have played a catalytic role in spearheading new activities and identifying the main thrusts of the government's development policies for the private sector to follow through" (1992: 13).

Two main types of public enterprises in Singapore are statutory boards and government-linked companies (GLCs). Statutory boards are autonomous organisations set up by specific Acts of Parliament. Their autonomy permits greater commercial flexibility. Recently, the Inland Revenue Authority, which collects income tax, property tax and other mainly direct taxes, have been turned into a statutory authority. Almost all infrastructural, promotional, and public utility services are provided by statutory authorities in Singapore. While they enjoy managerial flexibility, they are controlled by a small group of individuals.

The activities of the statutory boards are complemented by the GLSs which are in turn owned through three major holding companies. They are Temasek, Singapore Technologies and Ministry of National Development, MND Holdings. The GLCs are also controlled by a small number of individuals.

Recent initiative of the government to develop an external economy is also being led by the statutory boards and GLCs. Many GLCs such as, the Development Bank of Singapore (DBS), Sembawang Group, Singapore Technologies, Keppel Corporation, TDB Holdings, and Singapore Telecom have been aggressively expanding abroad, often in partnership with domestic and foreign private sector firms. As an example, a consortium of Singapore companies which will hold 40 per cent of total equity (with another 40 per cent held by the Tata Group and the remaining 20 per cent by Karnataka state government) in the Bangalore Information Technology Park in India to be completed by 1995, and whose total cost is expected to be Rs 4,825 million, includes two GLCs and three private sector firms. Moreover, public enterprises are not confining their activities to a particular area as evidenced by the Singapore Technologies, a defence sector company, teaming up with others to operate a family-dining chain across ten countries (*Straits Times*, Singapore, October 27, 1993: 40). This is consistent with the trend in east and south-east Asia where military has been involved in a wide range of defence as well as non-defence related ventures.

Statutory boards and GLCs have been provided with task of absorbing technology and becoming a counterweight to the multinational enterprises. They have also been in the forefront of promoting use of information technology, and spearhead-

and technology, through Research and Development (R and D).

The government has kept the subsidies to public sector enterprises at minimum; and has set bench-marks for them which not only retain but improve on Singapore's international competitiveness. At the same time, potential entry in the domestic arena and regulatory policies have been managed in such a way as to permit public sector enterprises to obtain high level of profits essential for upgradation. The balance between the profit-orientation and public service-orientation is overwhelmingly in favour of the former.

The issue of public-private mix and privatisation has also been discussed in Singapore. But privatisation is an elastic term and a variety of measures are usually included under this term (see figure). Singapore has emphasised cost recovery, user fees, corporatisation and partial divestment, i e, divestment without giving up control among the various aspects listed in the figure. Government's privatisation programme, spelled out in a 1987 Report of the Divestment Committee, is designed to broaden and deepen the stock market. It is also designed to permit relatively younger middle level technocrats in the civil service more advancement opportunities, thus helping to retain them in the public sector. It does not envisage privatisation as a way to spread risks associated with choosing technologies, markets, and products or to introduce a different management culture. The programme is also not being envisaged to promote local private firms. Instead, these firms are encouraged to team up with government enterprises both at home and abroad. It should be stressed that the impetus for divestment in Singapore has not come about because of such traditional reasons as the lack of technological dynamism, inefficiency, or drain on budgetary resources by public enterprises. Indeed, government enterprises have continued to expand scope of their activities, and their number has also been increasing. As their number and scope expand, there will be increasingly need to co-ordinate their decisions and activities, so as to prevent macro-economic failure and to ensure that their activities are consistent with public interest and objectives. This represents a formidable challenge to the policy-makers and its importance is likely to grow as public sector co-ordination problems become more complex, and various factors significantly weaken the material incentives to join public sector organisations.

A strong case can be made that in the Singapore context, its privatisation programme will make the role of government even stronger and more extensive. This is because there is an overall budget surplus, so the divestment proceeds are not needed to either reduce taxes or expand expenditure. Instead, these can be invested at home and abroad. Since divestment of such public enterprises as Singapore Telecom, Singapore Airlines and others has usually been partial which allows retaining control by the government even as divestment proceeds give greater control over financial wealth to the government. If this wealth is used to rationalise public sector portfolio, overtime the public sector could emerge stronger. This is likely to be the case in Singapore. Thus, public enterprises will continue to play a dominant role in Singapore. The government will continue to regulate competition to ensure adequate profits to these enterprises; linking efficiency with international competitiveness and trying to achieve them through administrative and political leadership. Producer

FIGURE: CLASSIFICATION OF PRIVATISATION MEASURES BY OPERATIONAL AREA OF IMPACT

Marketisation
The whole range of market-oriented transformation initiatives
Affecting

Ownership	Performance	Finance	Organisation	Business Environment
Divestment The transfer of ownership by: Private offer of shares Public offer of shares Restricted sale or lease of assets, e g land **Management/Employee Buyout (MBA)** Ownership is transferred to a group of managers and/or employees of the firm. **Leveraged MBO** The MBO if financed through credit from the financial sector or by the seller itself (the state). **Employee Stock Ownership Plan (ESOP)** Special financial arrangement promoted by the SOE to minimise the financial burden to the employees. Dilution of ownership. Allowing new private investments in the SOE.	**Contracting-Out** An external entity is paid to perform a service. **Agency** The transfer of the performance to a subject who acts in name and on behalf of the SOE. **Franchise** The lease of the enterprise to a firm who pays to acquire the right and bear all the entrepreneurial effects.	**User Pay** The main reliance is on financing by the users. **Cost Recovery** The consumer is called to finance more heavily the current operations of the firm. **Contractor Equity Financing:** "Build own and operate" (BOOs) contracts; "Build own, operate and transfer" (BOOTs) contracts.	**Corporatisation** The transformation of a government body in a Companies Act Company. **Performance-Related Incentives** **Memorandum of Agreement (MOA)** Agreements between PEs and government fixing objectives and other aspects of a PE or group of PEs. **Fragmentation** The breaking up of a firm in a number of separate entities.	**Liberalisation** Any measure aiming to increase competition and provide freer access to the market. **Deregulation** The removal of government imposed restrictions on any level or type of economic activity. **Demonopolisation** The removal of rules ensuring monopoly or quasi-monopoly market by non-renewing investments and allowing investments from the private sector.

interests will continue to receive priority over consumer interests. Privatisation exercise in Singapore is a good example of the maxim that the effects of a public policy should not be judged by the label given to it.

V
Central Provident Fund

The publicly-mandated arrangements for providing social security in Singapore consist of the Central Provident Fund (CPF) system and an extremely limited programme of public assistance. Among the high income countries, Singapore is alone in adhering to the provident fund mechanism; others use a combination of social insurance, social assistance and social allowance in their social security arrangements. The government is determined to continue the present system as long as possible. Affluence, demographic transition such as rapid aging[18] and below replacement rate fertility levels,[19] and political aspirations for participation, particularly by the aged, could significantly influence the outcome, however.

The CPF system which began in 1955 has evolved since then to become the dominant social security institution in Singapore. Indeed, a wide range of schemes under it, including home ownership, investment, health care, various types of group insurance along commercial lines, and others, have been introduced over the years (Table 3). As a result, the mechanics of the system have become exceedingly complex in spite of being a compact city state, in 1990.

The CPF is financed through mandatory contributions from employers and employees. The rate of contribution since July 1993 has been 18.5 per cent for the employer and 21.5 per cent for the employee. The rates are however expected to be equalised at 20 per cent each by July 1994. Such high rates are designed to generate sufficient forced savings for housing, health care and other needs during the working life, and still have sufficient amount left over for retirement. Even then in 1992, average balance at the withdrawal age of 55 was only $ 24,223, insufficient to finance retirement [Republic of Singapore, Department of Statistics 1993: 234, Table 12.16]. The CPF system, however, does not provide protection against inflation, or against longer than average span of life. The government is to extend the retirement age to 67 in two stages from the present 55, thus reducing the number of years for which retirement financing will be needed.

While the tax treatment on contributions, interest accruals, capital gains from approved investments, and withdrawals is generous, the rate of effective return is positively correlated with the marginal rate of income tax. Thus, the system is quite regressive. This will become even more so when GST is introduced, as then half the households will get no tax benefits as they will not be liable to income tax. Also, as the GST is expected to lead to a one-time price increase of at least 3 per cent, this will act as a tax on CPF wealth as their real value will be reduced.

Since the interest paid on CPF balances was made dependent on the average of relatively short-term interest rates, even though the CPF funds are of a long-term nature, the variable interest has often meant near zero or even negative real rate of return, particularly if the market basket of the elderly is considered. This could adversely impact on social adequacy of the scheme as a minimum of 3 per cent real rate of return is considered to be necessary by social security experts to provide the adequate replacement rate, i e, the proportion of the last drawn salary available to finance old age. There is also an implicit tax on CPF balances. Due to the budgetary surpluses of the government, CPF balances are largely invested abroad, but the probable higher real rate on those investments is not channelled back to the CPF members.

The above suggests that the CPF system has objectives wider than the provision of social security. Through the CPF, the government seeks to influence the avenues of consumption and savings, as well as to exert enormous social, political and economic control. It also puts almost exclusive reliance on individual or family for the provision of social security. Thus, the CPF system is consistent with the philosophy of the Singapore government concerning the role of the state. The CPF also permits conservative macro-economic policies, as it decreases the level of consumption, and allows socially desired allocation of income. Lower income tax rate made possible by state supported social security allows internationally competitive income tax policy to be pursued. High contribution rates could however increase labour costs to uncompetitive levels as happened in Singapore during the first half of the 1980s.

The CPF system is a flexible instrument. Thus, if the government does decide to introduce modest social insurance elements, the system can be easily modified to accommodate them. Thus, the catastrophic medical insurance scheme, called the Medishield scheme, at present covers only a handful of diseases; its coverage stops at age 70; its insurance payments are not related to income but to age; benefits are limited in amount; and it is not mandatory. Making the scheme compulsory, extending the age and dollar limits and the number of diseases covered, could be easily done through social insurance type premium arrangements. Thus, CPF provides a firm basis for more social security system more appropriate for an affluent society. The government has shown a high degree of pragmatism and innovativeness when particular challenges have arisen, and it is likely to do so in this case as well.

VI
Concluding Observations

This paper has analysed selected aspects of the role of the state in Singapore's

Table 3: Various Schemes under the CPF, by Type and Year of Introduction

Type	Scheme	Year Introduced
Home ownership	i) Approved Housing Scheme	1968
	ii) Approved Residential Property Scheme	1981
Investment	i) Singapore Bus Services (1978) Ltd Share Scheme	1978
	ii) Approved Investment Scheme	1986
	iii) Approved Non-Residential Properties Scheme (ANPPS)	1986
	iv) Share Ownership Top-up Scheme	1993
Insurance	i) Home Protection Insurance Scheme	1982
	ii) Dependent's Protection Insurance Scheme	1989
	iii) Medishield Scheme	1990
Others	i) Company Welfarism through Employers' Contribution (COWEC) Scheme[a]	1984
	ii) Medisave Scheme[b]	1984
	iii) Minimum Sum Scheme	1987
	iv) Topping-up of the Minimum Sum Scheme	1987
	v) Financing of Tertiary Education in Singapore	1989

Notes: a Present status of the scheme is unclear.
b From July 1, 1992 all self-employed people who earn more than S $ 2,400 a year must contribute to the Medisave. The initial rate is 3 per cent for all income groups. This rate will be raised by one percentage annually until it reaches 6 per cent.

remarkable rise to an affluent society in a short period of about three decades. In this transformation, the state played an extensive role, while its policies have been increasingly economy-centred. The state's role however has been complex and cannot be analysed in a simplistic state versus market dichotomy. Managing interactions between the two has been an important characteristic of Singapore's experience. Singapore was among the first Asian countries to allow the use of its territory as a production base. It thus was able to capitalise on the major waves of outward investment from the US, Europe and Japan to Asia. The state not only ensured that multinational operations were highly profitable, but it also undertook to build social and political cohesion among the elites; and took vigorous steps to ensure that Singapore prepared for the next stage or level of development. In the process, it depended on spotting and profiting from new activities and niches. This required extensive, powerful, but flexible and result-oriented planning and execution apparatus. As argued in the paper, the same policies and type of role of the state which Singapore has pursued successfully so far, could lead to very different results under different conditions and under different political and administrative structures. Indeed, as Singapore becomes accustomed to its affluence, and as amenities, including adequate social security and political and intellectual space, become important, the role of the state would need to undergo significant modifications in Singapore, and this will be a formidable challenge for the policy-makers. However, given Singapore's past record, innovative and pragmatic response can be expected from the policy-makers to help meet the above challenge.

Notes

[I would like to thank C T Kurien and Ramkishen Rajan for useful comments. The usual caveat applies.]

* All dollars unless otherwise stated are in Singapore dollars. In early February 1994, the exchange rate was US $ 1 = S $ 1.58 approximately.

1 Singapore's GDP grew at an average annual rate of 8.3 per cent during 1970-80, and at a rate of 6.6 per cent during the 1980-91 period [World Bank 1993: 240-41, Table 2]. The 1991 per capita GNP figure is also from the same source, Table 1, pp 238-39.

2 While state and government are distinct entities, given the one-party dominant nature of Singapore politics, the two are used interchangeably in this paper.

3 An indication of this domination is that during the 1982-92 period, 80 per cent of total investment commitments in manufacturing were from foreign sources [Republic of Singapore, Department of Economics and Statistics 1993: 120, Table 6.12]. In 1989, in Singapore's manufacturing sector, foreign firms (both 100 per cent and majority foreign owned) accounted for 76.3 per cent of gross output, 73.6 per cent of value added, 59.8 per cent of employment, 86.1 per cent of exports, 61.7 per cent of wages and salaries, 73.4 per cent of capital expenditure, but only 23.0 per cent of establishments [Republic of Singapore, Economic Development Board 1991: 4, Table 4].

4 In 1990, revenue and expenditure of statutory boards alone was 17.9 per cent and 13.5 per cent of GDP respectively [Low 1993: 173, Table 11.4]. The ratios would be considerably higher if the GLCs were added. Low also estimates that in 1990, public sector which includes both government sector and statutory boards, had revenue and expenditure equivalent to 44.1 and 34.7 per cent respectively, providing an overall surplus of 9.4 per cent of GDP. If current account surplus of the public sector rather than overall surplus is taken as a measure, the public sector accounts for more between one-half and two-thirds of gross national saving. Adding compulsory saving through the Central Provident Fund would raise the share to around fourth-fifths of the total gross national saving accounted for by the public sector. As at June 1986 there were 39 statutory boards, and as at September 30, 1986 there were 505 GLCs in Singapore [Asher 1989: 141-42]. Their number since then has increased, and the scope of their activities has widened, including participating in joint ventures abroad, mainly at the direction of the state.

5 Current data on direct investment abroad by Singapore are not available. But the position as at year-end 1990 was as follows. Wholly and majority local owned investor companies in Singapore had set up 1,479 companies abroad, with investment of S $ 3,423.2 million; with 84.2 per cent of the companies, and 60.7 per cent of the investments were in Asia, mainly in other members of the Association of Southeast Asian Nations (ASEAN) [Republic of Singapore, Ministry of Trade and Industry 1993: 105, Table 2]. According to the same source, as at year-end 1990, wholly and majority foreign owned investor companies is Singapore had set up 829 companies abroad, with total investment of S $ 4,050.6 million; with 79.3 per cent of the companies, but only 37.9 per cent of investment in Asia. In analysing the Singapore economy it is useful to distinguish between Singapore-owned and Singapore-based firms many of whom are MNCs with global operations. The above data do not indicate whether the value of direct investment abroad refers to equity portion or the total project cost, which could include equity share of other partners, including from the host countries, and debt. It is not unusual for project cost to be three to four times foreign equity from one country. It appears that the data refer to approvals and not to actual disbursements.

6 In 1960, Singapore had a negative saving rate of 2.4 per cent of GDP, while its gross capital formation was 11.2 per cent of GDP. By 1970, the saving and investment rates were 19.3 per cent and 38.3 per cent respectively. But by 1992, saving and investment rates were 46.4 per cent and 40.1 per cent respectively [Republic of Singapore, Ministry of Trade and Industry 1993: 120, Table A1.8]. Thus in little over three decades, Singapore has not only achieved high saver and investor, but has also become a net lender abroad.

7 Singapore has had an overall budget surplus (tax plus non-tax revenue less current and development expenditure) since 1968 [Asher 1989: 169, Table 5.12]. Singapore's fiscal system is discussed elsewhere in the paper.

8 In 1992, Singapore's literacy rate was 91.1 per cent, and 92.8 per cent of children between six and 17 years of age were attending school [Republic of Singapore, Department of Statistics 1993: 15].

9 In 1992, 87 per cent of the population lived in public housing, with 89 per cent of those in public housing owning their own flats. It should be kept in mind that land on which the public housing estates have been built is owned by the state. So the flats are owned on a land which is leased. In 1992, per cent of total resident population living in owner-occupied public flats was 82 per cent [Republic of Singapore, Department of Statistics 1993: 18].

10 In 1991, life expectancy at birth in Singapore was 74 years [World Bank 1993: 238-39, Table 1].

11 Brown indicates that the term corporatism is contentious and ambiguous, but nevertheless describes it as referring to "... attempts by an avowedly autonomous state elite to organise the diverse interest associates in society such that their interests can be accommodated within the harmonious, interdependent and organic national community" (1993: 2).

12 The phrase 'economic boundaries of the state' is from Helm (1989).

13 This and other figures relating to the OECD average are from OECD 1992.

14 The Land Acquisition Act of 1966 conferred very extensive powers on the state. A 1973 amendment to the act set compensation for acquired land at the market value as at November 30, 1973 or at the date of the Gazette notification, whichever is lower. Market value, in turn, is determined on the basis of the existing use or the Master Plan zoning of the land, whichever is lower. On January 12, 1988, an amendment changed the pegged price to its market value on January 1, 1986, or its value on the date of the notice of acquisition, whichever is lower. This is what allowed the increase in ownership of land by the government. More recently, the land acquisition price has been brought nearer to market price. But as four-fifths of the land is already owned by the state, practical importance of this is likely to be negligible. This act provided considerable leverage and flexibility to plan public housing, industrial, and commercial development.

15 For a detailed analysis of the implications of the GST on the Fiscal System, see Asher (1993).

16 For a more detailed analysis of the role of fiscal incentives in economic management in Singapore, see Asher, et al (1992) ch 5.

17 In today's globalised economic environment, this aspect has become even more important. This is because a time period over

which a particular location can expect to retain its competitive advantage has lessened considerably due to severe competition for investments and markets. As a result, location which do not plan for almost continuous upgrading soon lose their advantage.

18 According to the government estimates, by the year 2030, one in every four persons is expected to be above 60, as compared to one in every 11 persons in 1990. In the year 2030, 29 per cent of those above 60 are expected to be aged over 75; while one and two person households are expected to constitute 31 per cent of total households, many of which will be elderly [Republic of Singapore, Advisory Council on the Aged 1988: 21-22].

19 Singapore's fertility rate has been below the replacement level since 1975. In 1992, it had a total fertility of 1.74, much below the replacement rate of 2.10 [Republic of Singapore, Department of Statistics 1993: 34, Table 2.6].

Dimensions of India's External Economic Crisis

Sunanda Sen

This paper seeks to provide an analysis of India's recent external economic crisis, emphasising that the developmental dimensions of the crisis are distinct from the short-term liquidity aspects which are paramount to the international lenders. The discussion in Section I of the paper of a set of conceptual aspects is complemented in Section II by an analysis of the turn of events which led to the crisis. Section III offers a set of conclusions dwelling on the distinction between the exogenous/endogenous as well as the developmental/financial dimensions of the debt problem. The two aspects of the debt issue bring to light a basic incongruity between the diagnosis and the remedial measures implemented.

PROBLEMS in India's external payments reached a crisis proportion by the early 90s with questionings of the country's international credit worth in the international credit market after October 1990. A downgrading of the country's credit-rating which followed was matched by a virtual cessation of new lending or refinancing of private credit. The country has, since then, been managing its difficult external payments balance both with import compressions and borrowings from official bilateral and multilateral sources. Of late, the economy has been going through a spate of economic reforms. These embody the structural adjustment measures advocated by the multilateral lending agencies against borrowing at high conditionalities. This has initiated a new wave of debates on India's economic policy, dwelling on the optimal degree of openness for the economy.

The present paper seeks to provide an analysis and an account of the manifestations of India's recent external economic crisis. The paper addresses questions related to the crisis, the developmental dimensions of which are distinct from the short-term liquidity (or financial) aspects which are of relevance to international lenders. Analysis in Section I of a set of conceptual aspects is complemented in Section II by an analysis of the turn of events which led to the present crisis. Section III offers a set of conclusions, dwelling on the distinction between both the exogenous/endogenous as well as the developmental/financial dimensions of the debt problem. The two aspects of the debt issue bring to light a basic incongruity between the diagnosis and the remedial measures implemented in terms of debt management policies—on development in debtor areas as well as on the prospects of finding external markets on the part of the lender countries.

I

Some Conceptual Issues

We want to draw attention to the fact that for borrowing economies, problems in their external payments generally relate to a set of factors which may be either exogenous or endogenous to the domestic economy. For understandable reasons, the ability of a country to steer through a difficult payments situation would be relatively weak as exogenous forces prevail over the endogenously determined circumstances. Such circumstances weaken the case for structural adjustments in the debtor economies, and also the case for debt negotiations on a case-by-case basis, both of which are anchored on borrower country disorders and remedies. This, however, is not to deny the possibility that exogenous factors may at times turn out to be fortuitous if favourable factors combine to shape up the borrowing country's external payments.

On the whole, these dimensions of the external payments problem concern the distinct and rather asymmetric aspects of the debt issue, viewed very differently by the debtors and the international lenders. A debt trap, experienced by debtor nations, is often conditioned by factors which are exogenously determined for the economy. The lender agencies on their part harp on the short-run debt distress indicators at country level which according to them provide explanations of the debt problem. These dwell on aspects which are of concern to these financial institutions. By and large the dominant view of the lender institutions has identified the endogenous factors as generally responsible for the crisis. This justifies them to enforce a set of remedial measures through SAP and related policies as are supposed to eradicate the internal (or endogenous) malaise in the debt-ridden countries.

Aspects of the payments crisis for a borrowing economy, the origins of which can be traced back to the externally determined factors, are often lost sight of in these policy prescriptions. This remains especially true with the conventional package of reforms which are generally advocated for the debt-ridden countries as the route to balance of payments adjustment. The compulsion on the part of these countries to accept the norms set by the multilateral funding agencies (mostly the World Bank and the IMF) in the standard packages of structural adjustment programme thus ignores the fact that the problems are also caused by factors which do not necessarily have their origin in the debtor economy. Examples of such externally determined factors include the stagnant export market abroad and the limited prospects of fresh borrowings as are faced by the developing countries.

The second dimension of an external economic crisis faced by a debtor country relates to the distinction, often overlooked in the literature, between short-run liquidity indicators and the long-term developmental aspect, both relating to the domestic economy. The liquidity indicators comprise the standard measures of debt serving capacity including the debt service ratio, the debt to GDP, debt to exports ratios and foreign exchange reserves expressed as a proportion of imports. In addition, the ratio between short- to long-term debt, the ratio between undisbursed to disbursed debt and the level of official exchange reserves net of IMF repurchase liabilities also deserve attention. While crucial to judge a debtor country's short-term liquidity position, the last three mentioned variables are usually overlooked in the standard debt literature. (Increases in short-term credits as pointed out in an AMEX Bank study on debt often signify a rise in debt-related liabilities during the short run, an outcome which frequently triggers off 'defensive' banking action to withdraw these credits, with "the slightest uncertainty regarding the creditworthiness of borrower".[1])

Attention may be drawn, at this point, to the pace of real transfers to a debtor country which, at a closer look, provides the links between domestic accumulation or development and balance of payments. It also provides the developmental dimension of debt as distinct from the financial or short-term liquidity dimension. A positive flow of real transfer can be defined as the net inflow of goods and services at current prices (excluding interest payments on foreign loans) from abroad.[2] In the absence of offsetting changes in domestic savings, real transfers can thus act as a supplement to domestic savings available for accumulation. Even when the current account deficit continues to widen, *net* inflow of loans, and as such the

flow of real transfers from abroad may cease to grow, especially with a rising interest burden on foreign debt. In extreme cases, the real transfer may turn negative (the case of reverse transfers) with or without current account deficits. The argument can be spelt out as follows:

$$RT_t = CAD_t - iD_t = M_t - X_t \quad \text{... (1)}$$

where RT_t: real transfers to debtor country during period t; CAD_t: current account deficit during period t;
D_t: debt outstanding at the beginning of period t;
i: rate of interest on past loans;
M_t and X_t: value of imports and exports.

It is possible to show that domestic growth rate in the debtor country (g) is a function of RT.

From $Y_t = C_t + I_t + X_t - M_t$
we get $Y_t = C_t + I_t - RT_t$ ... (2)
or $sY_t = I_t - RT_t$
Rearranging, $g = \frac{\dot{Y}}{Y} = \frac{s}{k - \frac{RT_t}{Y}}$ ... (3)

where g: rate of growth of GDP, s: marginal propensity to save, k: capital-output ratio.

From (3) it is evident that a rise in RT would raise 'g' provided 's' and 'k' remain unchanged. Alternatively, increases in the absolute size of a negative RT (implying an excess of X over M) causes a drop in 'g'.

Now $RT = CAD - iD_t = \dot{D} - (a + i) D$ ... (4)
For $RT > 0$ we need $\dot{D} - (a + i) D > 0$
or $r = \frac{\dot{D}}{D} > (a + i)$ ... (5)
where 'r' is the growth rate of gross inflow of capital.

With heavy debt-serving schedules, the debtor nations may be compelled to enter into fresh borrowings, inevitably at high conditionalities, primarily to continue with debt-servicings. The structural adjustments in the debtor economies often raise their import propensities, initiated by the import liberalisation packages which accompany the reforms. While the flow of net finance (gross loans less debt charges) declines, possibilities of actual increases in imports may turn out to be rather dim when exports fail to perform. The debtor nations are then forced to settle for a lower level of real income at which the requisite imports can all be financed. This can be characterised as a path of import-led GDP compression.[5] The argument can be supplemented by Figure 1 which depicts the sequence of import-led GDP compression. With stagnant export earnings during the short-run the X X line is horizontal since exports do not depend on domestic GDP as long as they are not supply constrained. We also rule out the possible favourable effects on exports as might cause upward shifts in the X X schedule due to changes in domestic policies (e g, devaluation import liberalisation, export subsidies) or foreign income and/or prices. The import function $M_0 M_0$, shown as a function of domestic GDP shifts upward to $M_1 M_1$ with liberalisation of imports under debt conditionalities. With net external finance at zero or negligible level, the rise in import propensity would bring down the equilibrium level of GDP from Y_0 to Y_1, indicating a typical process of import-led GDP compression under structural adjustment policies. It may be here recalled that countries burdened with large debt and conditional borrowings typically face cutbacks in real transfers, which in turn are consistent with an import-led GDP compression.

Conceptualising further, one can identify the three successive phases in a debt process which generates unfavourable movements in a debtor country's external accounts, characterised by continuous declines in the flow of real transfers. Phase I starts with the financing of the real transfer by means of net capital inflows. The positive real transfer records an inflow of resources. As the gross

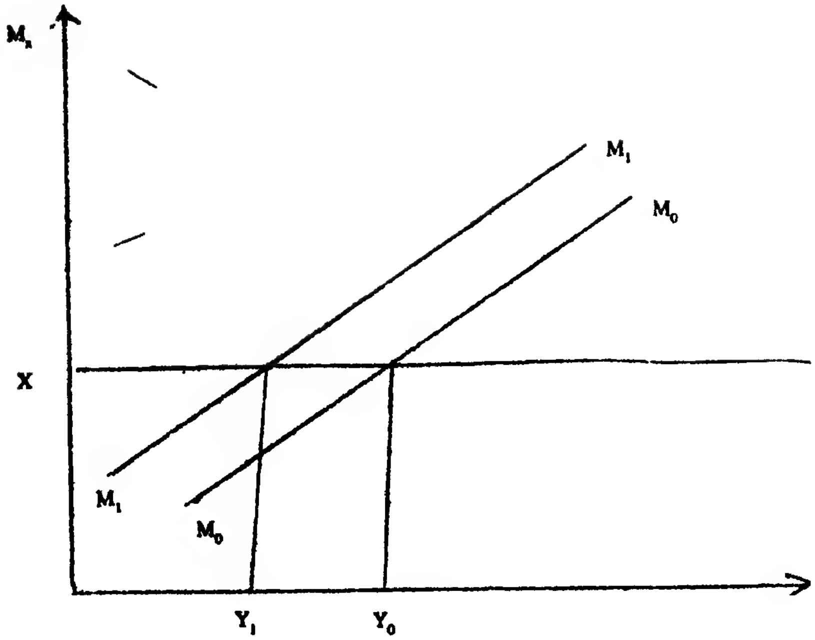

FIGURE 2

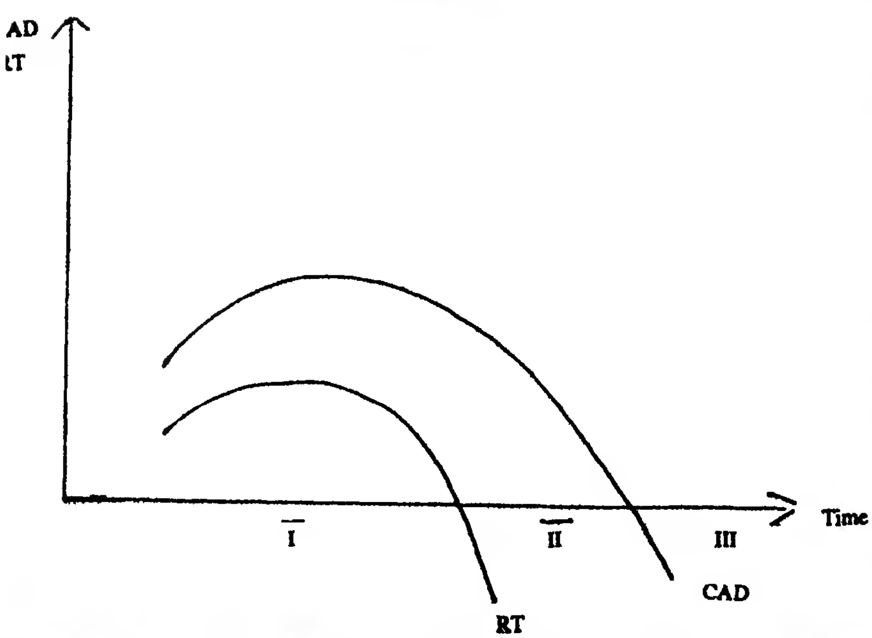

inflow of external finance tapers off, real transfers start declining while the current account deficit may continue to grow, largely due to the mounting interest payments on past loans. The tendency for a declining real transfer to taper off signifies the transition from Phase I to Phase II. This also marks the beginning of both a debt crisis and a debt trap, the former with the compulsions on part of the debtor to adjust along a path of import and GDP compression; and the latter with the debtors' compulsion to secure loans to meet debt charges rather than to finance a positive flow of real transfers. This leads to Phase II of the debt process—one where the real transfer has already turned negative. This is the phase which characterises a typical debt trap situation since short of default, the debtor is compelled to borrow, and the finance thus secured is used to meet debt charges rather than provide for real transfers. A process of expenditure cuts and consequent output compression (which is a part of the conditional loan package) cuts back the import demand of debtors which generate a reverse flow of real transfers from abroad. Phase III starts off with positive current account balances. As in Phase II, real transfers to the debtor economy continues to be negative and the debt is serviced exclusively by means of the debtor's own exchange earnings. Moreover, the swings in the current account to a surplus (i e, a negative CAD) signify an outlow of finances in the capital account to meet the growing amortisation payments

In terms of equation (1), the three phases of the debt process can be characterised as follows:

Phase I: $RT = CAD - iD > 0$ and $CAD > 0$
Phase II. $RT = CAD - iD < 0$ and $CAD > 0$
Phase III· $RT = CAD - iD < 0$ and $CAD < 0$

It can be noticed from equation (3) above that growth rates in the debtor economies may not be sustainable with declining RTs eventually turn negative during Phases II and III An evidence is provided by the low and negative growth rates of GDP, matched by low/negative RTs experienced by the major debtor countries during the 80s. With consumer price indices hovering around astronomical heights, growth in per capita GNP had actually been negative during 1980-89 for Argentina, Mexico, Nigeria and the Philippines, and rather low in other large debtor countries (see Table 1 for comparative statistics on debt). In absence of compensating mobilisations of domestic savings (which is difficult to achieve when growth rate and/or expansions in tradable output are low), a narrowing down of the real transfers can thus be instrumental in initiating declines in the growth rate of GDP in the debtor economies. If inflation is uncontrolled in the borrowing economies this also affects the distribution of income and hence per capita GDP.

The literature on debt crisis and its management has relied on the short-run liquidity indicators of external debt country level data for which is used to advocate remedial adjustment policies in the debtor countries. While theoretical models, including the early versions of debt-cum-growth models or the more recent models of optimal borrowings (which in turn incorporate the long-term solvency argument by stressing pre-committed investment targets by debtors as part of loan package) were all concerned with real growth in the debtor country as a precondition for continuing the debt process, the criteria chosen by the lending agencies to assess debt servicing capacity has been consistently around the short-term liquidity indicators. Failure, on the part of the large debtors to maintain a reasonable growth record does not necessarily tarnish the micro profit maximising norms of the private lenders. Instead the international financial institutions tend to accept these lapses as the necessary transitional costs for achieving allocational efficiency and long-run growth. In absence of evidences to the contrary it is difficult to ignore the developmental dimensions of the debt process which include

Notes: QI = Quantum Index, UVI = Unit Value Index, NNP = Net National Product, RER = Real Effective Exchange Rate.

both the dwindling or negative real transfers of resources from the debt ridden economies and the import-led GDP compressions in these economies.

Dimensions of the debt problem which are exogenous in origin and developmental in nature need to be handled separately, as areas of concern to the developing countries. The issues are different from the debt distress symptoms, characterised as endogenous in origin and financial in nature; issues which are of special concern to the lending institutions and countries.

II
Manifestations and Analysis

Indications of a grave external payments front for India was evident to the world economy by the early 90s as Moody's Investor Service, a leading international credit rating agency, put India under credit watch in July 1990. Moody's came out with two significant country reports on India, one in October 1990 and the other in December 1994.[4] Concern expressed in the October 1990 report over the performance of India's external sector was followed by an appreciative tone, in the December 1991 report, about economic reforms which were launched in the country since mid-90s. The successful loan negotiations between India and the multilateral financial institutions like the IMF, the World Bank and the Asian Development Bank provided additional grounds for optimism in the December 1991 report. India's credit ratings, however, continued to be rather low. Thus the Oil and Natural Gas Commission failed to float its long-term bonds in the Eurobond market in December 1991 when the country's credit ratings against long-term borrowing were still as low as BA2. Overall, the country had a credit rating as BA2 which has not so far improved at the time of writing this paper.[5]

Between April 1984 when India drew last from the IMF under the Extended Fund Facilities (EFF) and July 1990 when the reserve tranche of $ 0.69 billion was drawn by the country, no fresh drawings were made. It was thus natural that a negative flow (or repurchase) from the Fund prevailed during most of the intervening period.[6] However, with the net flow of private credit at its low ebb since the early 80s, the country was clearly dependent on high conditionality borrowing from the official multilateral credit agencies. The latter usually are linked to a package of structural adjustments including privatisation and liberalisation of markets in the domestic economy. As contrasted with the experiences of other heavily indebted countries, which successfully re-entered the international credit markets by means of the Fund Bank and Paris Club negotiated loan adjustment programmes, India has not so far succeeded to re-establish her credit worth in private markets. The phenomenon, in our judgment, needs scrutiny and analysis.

In October 1990 a set of six factors were singled out by Moody's[7] as responsible for the drop in the country's credit ratings. These included (a) the rise in the debt-service ratio; (b) the higher level of external commercial borrowings and their impact on interest liabilities; (c) increase in the debt to export ratio; (d) the Gulf War of 1991 with its adverse effects on India's export earnings and flow of migrant remittances from abroad; (e) budget deficits with a rise in internally held public debt and the growing interest liabilities which further fed into the deficit, generating inflationary pressures within the country, and finally, (f) an adverse international economic environment in terms of a recession in the OECD economies having adverse prospects for global export growth rates. Coupled with the narrowly diversified range of India's exportables, the latter signified, according to Moody's, rather poor prospects for India's exports. Interestingly enough, the October report of Moody's anticipated a potential lender risk as might result from the sudden opening up of a highly regulated economy like India even when the pace of opening up was gradual. The risks were considered to be greater because of uncertainty created by the internal political dynamics in India and also due to the adverse global economic circumstances.[8] Internal political dynamics, however, continued to prevail in financial circles, especially with the minority status of the present government. This probably explains a large part of the current hesitation on part of the world financial community to reaffirm their confidence in India's credit worth, despite the opening up of the economy.

To ascertain the manifestations of India's external economic crisis, it is appropriate to look at the changing components of both her international accounts as well as her stock of foreign assets/liabilities. The fast deterioration in India's current deficit during the 1980s was compounded by a changing mix of finances in her capital account the sources of which were either non-sustainable or commercially non-viable. We consider, in the rest of this section, the magnitude as well as the sources of financing for India's CAD as took place since the beginning of the 80s. This is followed by an assessment of the short-run indicators of India's debt-servicing capacity. Finally, a close look at the flow of current real transfers and the sources of their financing completes the picture.

Deficits in India's current account widened considerably during the 80s, both with worsened merchandise balance and diminished migrant income flows, due to the end of the oil boom and the Gulf War. Coupled with the growing interest liabilities on foreign loans, the changes considerably strained the current account balances, as can be seen from Table 2. This was matched by a rising trade deficit, which went up from roughly $ 1 billion during 1960-61 to $ 7.8 billion in 1985-86 reaching, after minor reversals, a new peak of $ 9.3 billion in 1988-89. The major factor responsible was the spurt in import payments, which at current dollar prices rose more than tenfold between 1960-61 and 1988-89. Export values, however, were relatively stationary, and export earnings at current dollar prices rose only threefold during 1960-61 to 1988-89. The relative growth in dollar value of imports during 80s contrasted the actual declines which were rather steep during 1991-92. It was the import compression evident during the year which also achieved a cut-back in the trade deficit. The latter, at (-) $ 7.75

billion in 1990-91 fell to (-) $ 3.07 billion during 1991-92 (Table 2).

The second set of forces which initiated the adverse changes in India's current account during the 80s included the end of the boom in the flow of remittance from non-resident Indians and the steady growth in interest payments on externally held debt. Private transfers from abroad had emerged as important sources of India's invisible earnings from abroad, especially since the mid-80s. In 1986-87 these flows exceeded other sources of invisible earnings from abroad, largely due to the drop in worker remittances at end of the oil boom in the Middle East. The boom in NRI income transfers, however, as we had predicted in an earlier paper,[9] was short-lived and these flows dried up at the beginning of the 1990s with apprehensions regarding increasing political uncertainties in the country. Simultaneously, interest payments on foreign loans continued to grow, especially with the growth in the stock of commercial sources of borrowing and in short-term sources of finance since the middle of the 80s (Table 5). With private transfers no longer sustainable by the end of the decade, it was not surprising that the country's current account deficit widened by 1989-90. This was followed by reductions in the trade deficit, matched, since 1988-89, by less than proportionate reductions in the current account deficit. India's external accounts thus reached a stage where the CAD could no longer be manipulated by controlling the size of the TD.

Looking at the pattern of India's CAD since the early 80s, it is possible to discern three distinct stages. The first spans the earlier half of the decade when trade deficits (TD), ranging from $ 5.65 to $ 7.57 billion, were systematically financed by invisible surpluses, narrowing down the CAD to a range of $ 2.09 billion to $ 2.39 billion. Years between 1985-86 and 1989-90 marks a second phase with a steady pace of import liberalisation and expansions in import bills which fed into the widening trade deficits. Net invisibles as well as transfers of inflows, however, fell steadily during this phase and despite temporary drops in TD during 1987-88 the CAD continued to widen further largely because of the rise in interest payments. TD as well as the CAD rose further after 1988-89 when net invisible earnings nearly disappeared. In effect this indicates the beginning of a new pattern in India's external balance; one where trade volatility was matched by an uncertain pattern for the inflows of invisibles and transfers, impairing the element of flexibility in adjusting the current account as annual interest liability in the current account deficits rose steadily. Flows of private transfers which had assumed a significance in India's current account since 1987-88 almost discontinued by the early 1990s. The tapering off in these net private transfers at end of oil boom was followed by further shocks due to domestic political uncertainty in India. This marks the third stage when the CAD reflected less of the changes in the TD because of the simultaneous drop in the inflow of invisible earnings and the steep increases in interest payments abroad. The near disappearance of the net invisible balance (which touched a low of $ 0.02 billion in 1990-91) was matched by steady increases in the interest bill (at $ 2.17 billion in 1990-91). Evidently it became rather difficult to reduce the size of the CAD by means of reductions in the TD. Correspondence between the TD and the CAD (which in official statistics moved in the same direction during most of the 80s) seems to have been disturbed by the 90s as other invisible earnings tended to disappear. (It can be seen from data in Table 1 that imports have shown noticeable declines during the last couple of years. The resulting cutbacks in the TD, again, had a less than proportionate impact on the size of the CAD, largely because of the drop in invisible earnings net of the rising interest bill.) The new pattern is evident in the share of the CAD as a proportion of GDP, which was higher than the respective share of TD as a proportion of the GDP. This also indicates the difficulties of controlling the magnitude of the CAD by means of reductions in the TD. The explanation, as already mentioned above, lies in the volatile flows of non-resident income flows as well as in the build-up of the interest liabilities. Thus the CAD in India no longer seems to be amenable to control, by means of structural adjustments which can only restrain the TD through import compressions. Indeed, the influence of exogenously determined factors on the CAD (e g, those which influence export earnings and the net flow of invisibles net of interest payments or capital inflows net of repayments) seems to be more powerful than those of the endogenous forces, typically achievable through structural adjustments

The crisis in India's balance of payments during the late 80s had its build up in the early years of the decade, with decisions to borrow short-term commercial sources of external finance in order to meet worsening trade deficits [10] This considerably added to the already large and inflexible debt services. With exports averaging around 5 per cent of GDP during 1985-90 and rising marginally to 6 3 per cent by 1990-91, an explanation for the widening of the TD over 1985-86 to 1990-91 has to be sought in the dynamics of India's import behaviour. We have argued elsewhere that a move towards import liberalisation, initiated in India since the mid-80s can explain these surges in imports. Imports were liberalised, not only through expansions in the Open General List (OGL) but also through absolute expansions in the ceilings fixed against most categories of import licences.[11] Impact on the import volume can be noticed in the doubling of the import volume index during 1978-79 to 1988-89, at a pace which exceeded the increases in the real NNP index during the period Compared to the volume index of imports, its value index, in dollar terms, showed a steady but lower rate of increase (Table 4 and Figure 3). Changes in the import volume index can thus be identi-

fied as a major factor behind the expansions in India's value of imports For India an increased 'import propensity' is thus confirmed, with relative increases in the import volume index relative to that for NNP at constant prices In the same study we also have drawn attention to a second dimension of import liberalisation in India during these years, with export linked import licences adding more to the dollar value of imports rather than to exports. The findings put to doubt the claim that these import-linked export incentives had actually narrowed the gap between exports and imports. During 1990 difficulties in securing trade and other short-term credits forced commercial banks in India to deny import financing (trade credits), even to those who held valid import licences. A large measure of import compression resulted both with these measures and later with simultaneous declines in GDP, the growth rate of which fell from the 7 per cent annual average of the three preceding years to 1.4 per cent during 1991-92.[12] These resulted in absolute declines in the value of imports during 1991-92. Thus imports played a dominant role as an explanatory factor behind movements in India's trade balance.

Factors precipitating the external payments crisis in India during the second half of the 80s also included the mode of financing the current account deficits which had an adverse impact on the time profile as well as the magnitude of debt liabilities. The process depleted the cushions of official reserves as well as the stock of unutilised credit (including the Fund drawing facilities), which normally provide a short-term cushion for external financing. The resulting situation resembled what the AMEX Bank has described a 'payments crisis' for borrowing countries, one signified by a 'swing' from a 'liquidity surplus' to a 'payments gap'.[13] Evidently India was pushed from a 'liquidity surplus' to a 'payments gap' scenario during the 80s. Heavy depletions of exchange reserves and a build-up of commercially held debt during the late years of the 80s (Table 5) led to expansions in the stock of India's outstanding medium-term and long-term debt which, in terms of official statistics, went up from $ 22.38 billion in 1985-86 to nearly $ 39.89 billion by September 1992. NRI deposits and short-term credit also rose considerably during the period. Table 5 makes it evident that short-term and other commercial borrowings exploded during the second half of the 80s, adding substantially to the debt-service liabilities by end of the decade.

A steady worsening of the different short-term debt indicators, tabulated in Table 3, supplements the picture. The steady increases in the value of short-term bank credit with maturity of one year or less since the late 1980s which was followed by a sudden drop in NRI deposits and short-term credit during 1990-91, led to a drop in ST/LT during 1990 and 1991 (Tables 3 and 5). The pattern is similar to a typical "triggering of a defensive bank action", as described by the AMEX bank, "...with accumulation of short-term debt by debtor nations followed by a sudden decision on part of banks, apprehensive of a debt crisis, to curtail short-term credit".[14] Factors as above clearly pushed India to a classical situation of 'payments gap', one which had already altered the international financial community of possible 'liquidity shortage' and the political risk of lending to India. In India short-term credit of less than one year's duration (both banking and non-banking/trade related flows) declined significantly during the second half of the 80s, thus reducing the proportion of short-to long-term credit (ST/LT). Also, the ratio of undisbursed to disbursed credit (UD/D) which reflects the debtor capacity in terms of short-term debt management, declined after 1989-90. As mentioned earlier, both these debt indicators have actually been picked up by the AMEX bank as factors which may prove crucial for debt management in the short run. Countrywise data on both ST/LT and UD/D are available from publications of the BIS, supplementing the World Bank or the BIS/OECD data on long- and medium-term external debt.

Difficulties in financing the current account deficits (and especially the contractual interest payments on foreign loans), made it natural that in India there was a cut in real transfers from abroad Attempts to procure external finance to meet the growing debt service payments, typically led to a debt-trap situation, one where the compulsive borrowings are no longer available to finance imports. These aspects of debt-finance indicate the developmental dimension of the debt issues, an aspect which as mentioned above hardly had much of an appeal to the lending agencies. For India the current dollar value of real transfers from abroad actually declined both during 1989-90 and more significantly in 1991-92, as can be seen from Table 6. Contrasting to the increases in the gross inflows of capital, real transfers to India seem to have improved only marginally since the mid-80s, a picture which is attributable to the sharper increases in the debt-related outflows in the country's international accounts.

For India the stagnating inflows of real transfers since the mid-80s were matched, as could be expected, by increasing difficulties of procuring net external finance from abroad. Table 6 provides an account of the changing pattern of external finances which provided for the real transfers from abroad. Steady depletions of official reserves seem to rule out further possibilities of using these primary sources of liquidity (including the drawing rights at the Fund) by end of 80s. Simultaneously, the secondary sources (the unutilised credit lines) dried off, with lower rates of refinancings and issue of fresh loans. An earlier phase when India had net drawings from the Fund terminated in 1981 as the country returned SDR 1.5 billion drawing rights sanctioned under the EFF to the IMF. A series of Fund repurchase ar-

rangements, which settled the earlier drawings in terms of the EFF and other windows, resulted in a negative flow in relation to the Fund, an outcome which effectively added to the overall annual payments liabilities. A changed pattern, with positive inflows from the Fund, amounting respectively, $ 1.21 billion and $ 1.31 billion during 1990 and 1991, indicated fresh drawings, under the head of reserve tranche ($ 0.69 billion during July-September 1990), the first credit tranche ($ 0.79 billion in January 1991), CCCF ($ 1.88 billion during January-September 1991) and standby facilities ($ 0.38 billion drawn over November 1991-January 1992 out of a total of $ 2.2 billion) utilisable by June 1993. (The major source of external finance for India however has so far been the bilateral and multilateral sources of concessional loans, and can be verified from Table 5. As a contrast, private sources of credit as well as transfers tapered off, at end of a short-lived boom, by 1990.)

Despite a significant revival of official capital inflows during the early years of the 90s (especially with the favourable loan approvals with the Aid India Consortium, the World Bank, the Asian Development Bank and the Japanese Government) it has not so far been possible for India to compensate the sharp declines in private sources of finance, which evidently was relatively sensitive to what they judged as uncertain economic and political climate in the country. Thus real transfers as well as the CAD declined, in terms of official statistics, during 1991-92 (Table 2). Evidently, India's external accounts was subject to a set of adverse circumstances which included both declines in private capital inflows and transfers, an exhaustion of official exchange reserves, and disruptions of the export markets for commodities and services in both the Gulf area and in the socialist countries of east Europe and Russia. Attempts to finance an inflated import bill and other external liabilities by means of market sources of finance during the mid-80s introduced further constraints in the country's external accounts by the end of the decade

The country had, in these circumstances, little option to avoid the situation of a "debt-trap", one where fresh (gross) borrowings, were no longer available for import finance The import compressions which are forced in these situations are generally achieved at cost of domestic growth, especially when the country simultaneously pushes an import liberalisation policy in the domestic economy A rise in import dependence, both technological and financial, under a liberalised trade regime thus poses a problem as the capacity to import shrinks because of non-availability of net external finance. Thus, while the proportion of imports at each level of GDP goes up with import liberalisation, difficulties of securing foreign exchange from exports and net capital inflows constrain the growth rate of GDP in these borrowing countries.[15] The adjustment in the balance of payments which then follows takes the standard route of a deflationary path, as experienced by several large debtors in different parts of the world (see Table 1 on debt profile of the large debtors). Such processes typically depict the theoretical arguments advanced earlier in Section I of this paper.

Attention may be drawn, at this point to the margin of discrepancy between the official sources and the Moody's sources of statistics on India's current account. Export/import values in the Moody series are respectively higher/lower compared to the official data sources, as can be seen from Table 2 The consequent narrowing of the trade deficit in the Moody series (as compared to official statistics) is however matched by a significantly wider margin of CAD in the latter, largely due to the higher interest bill in the Moody series which reflects the discrepancy in Moody's data for externally held long and medium term commercial borrowings (Table 5) Evidently, India's ability to bridge the CAD by means of compressing the TD seems to be even more limited in terms of the Moody series of data sources Also, the magnitude of real transfers to the country seem to be of a smaller magnitude

III
Conclusion

India's access to sources of international finance have of late been less than adequate to sustain a growing transfer of resources to the country from the rest of the world. This has considerably impaired the growth prospects in the economy by curtailing the country's import capacity in the face of rising levels of both capital and import intensity. The lower rate of GDP growth has reduced the growth in import demand, despite the increases in the import intensity of output as has resulted from the recent spate of import liberalisations in the economy. The process can be characterised as one of an *import led GDP compression,*[16] an experience shared by a large number of countries in Latin America and sub-Saharan Africa which relied heavily on external debt.

The debt process, under these circumstances, leads to a situation where the debtor country becomes a compulsive borrower, in order that the debt charges can be met on schedule. While efforts to control imports and the trade deficit by means of restraints on output continues, the inflexible and growing debt services constrain the capacity of the country, by means of endogenous efforts, to limit the size of the current account deficit The country thus continues to borrow, in order to finance the latter, without, however adding to its capacity to import.

The above aspects of the debt process, characterised in the paper as the *developmental dimensions of the debt issue* paper, have by and large been side-tracked by the lender agencies Concern with the short-term liquidity aspects have led these agencies advocate packages of economic reforms which are often antithetic to long-term growth Some attempts, however inadequate, were made by official agencies (say the Baker initiative of 1985) to instil ele-

ments of solvency through long-term growth in the debtor economies. Incidentally, attempts to revive fresh flows of capital to the developing countries would also open up new markets for goods from the advanced economies. Since the developing economies have so far been importing more of goods rather than services (excluding interest payments on past loans), the result would be a global regeneration of demand. This would tilt back the demand in favour of industrial capital, correcting the disproportionate expansions in finance (capital) related activities in the services sector.[17]

Among factors which could be held responsible for the deterioration in India's balance of payments since the mid-80s one can mention (a) the pace of import liberalisations which contributed substantially to import expansions since the mid-80s, (b) a rather stationary export growth, (c) decline in worker remittances and non-resident transfers from abroad, and (d) a spate of commercial borrowings which included short-term credit. The combination led to substantial trade deficits during the 80s which widened dramatically during 1988-89. Improvements in trade balance, noticeable since 1989-90, were achieved through domestic monetary and fiscal restraints (rather than import controls). Thus availability of short-term import finance was curtailed by the banks while a general squeeze in import demand (at a lower level of GDP) was achieved through deflationary monetary-fiscal processes. It needs to be stressed here that both the import liberalisation efforts and the fiscal-monetary contractions were outcomes of an economic reform programme, initiated through the IMF and the World Bank. Other factors which precipitated the balance of payments crisis included a pressure to service the debt at high interest rate and their shorter maturity. These added considerably to interest and repayment liabilities by end of the decade. A decision to deplete, under the financial pressures of the late 80s, the officially held reserves limited the options for the government by the beginning of the 90s when new avenues of finance had to be found, both for meeting the payments deficits and to rebuild the reserves. As international capital markets had already turned hostile to fresh demands for credit from developing country borrowers by the early 80s, the country found it increasingly difficult to have access to the private markets for international credits.

India's payments crisis by end of the 80s was thus precipitated by a set of forces the major part of which were exogenously determined for the domestic economy. The exogenous factors which influenced the current account included an adverse international economic environment which arrested the potential growth of exports and simultaneously pushed up the nominal as well as the real interest rates on outstanding loans. (One can recall here the note of caution in Moody's October 1991 report which predicted rather poor prospects for India's export growth in view of the global tendencies for recession and protectionism.) The rise in nominal interest rates was related to the upward movements in the Libor rate and the growing US fiscal deficit during the 80s. A slump in primary product prices, matched by recession in the OECD, hiked further the real interest rate for developing countries as a whole, once the nominal interest rates were deflated by the price index for the LDC exports. The uncertain political and economic climate in the country led to further declines in private capital flows—which included the adverse flow of short-term non-resident deposits in India, non-resident transfers, trade credits as well as the long- and medium-term commercial loans. The squeeze in credit was also influenced by a general reluctance on the part of commercial banks to lend further at the end of the debt crisis, especially to the developing countries. Faced with a set of exogenously determined factors which contracted the current and capital account receipts, the options left to the Indian government were considerably narrowed down, in terms of balance of payments management.

It is significant that real transfers from abroad had started declining since the early years of the 80s, indicating the difficulties of obtaining net external finance for additional imports. With gross inflows going up, the situation indicated the symptoms of a debt-trap for India, one where the country had to borrow compulsorily in order to service old loans. The impact of these changes on the domestic growth rate was, for obvious reasons, not so favourable. Aspects as above need to be highlighted, as the developmental dimensions of external debt are no less important than the financial issues of external debt.

2 See for similar applications of the real transfers, Sunanda Sen, 'External Economic Constraints and Domestic Economic Policy', *Economic and Political Weekly*, January 11, 1986. See also, Sunanda Sen, *Colonies and Empires: India 1890-1914*, Orient Longman, 1991.

3 Moody's ratings for India fell from A2 in October 1990 to BAA1 for long-term borrowing and later again from BAA1 to BAA3 in March 1991. For short-term borrowings the ratings downslided from P1 to P2 in July 1990 and then again to P3 in July 1990. Either rating indicated levels at which refinancing or sanctioning of new loans were virtually impossible. Credit watch on India has been maintained through 1991 and 1992, not only by the Moody's but also by the Standard and Poor and the Japanese Bond Research Institute. The ratings indicated poor investment options for the borrowing country. Thus "bonds rated as BBAs lack outstanding investment characteristics as well"; also, "short debt rating P3 is the lowest prime lending rate". See Moody's Ratings Moody's Investor Service, April 1991.

6 Fresh drawings took place during 1991 and 1992 and a total of $ 3.05 billion was drawn during January 1991-92, which comprised the first credit tranche, the Cash Compensatory Financing Facilities (CCCF) and Stand-by Facilities. In addition the country had an unutilised stand-by credit facility of $ 1.82 billion, which was already sanctioned. A Structural Adjustment Loan, of $ 500 million from the World Bank and a programme loan of $ 250 million from the Asian Development Bank supplemented the above. In addition, the Paris Club group of official donors met at the Aid India Consortium in June 1992, granting a credit of $ 7.2 billion for 1992-93. The sum exceeded the credit sanctioned during the preceding year by at least $ 50 million. See *The Economic Times* (Bombay), August 23 and 25, 1991. 10 See Moody's Report on India, October 1990.

11 See for empirical and conceptual bais of this argument, Sunanda Sen and R U Das, 'Import Liberalisation as a Tool of Economic Policy in India since the Mid-Eighties', *Economic and Political Weekly*, April 8, 1991.

12 Government of India, *Economic Survey 1991-92*, Part 1, p 2. Average monthly percentage growth of non-oil imports was at 14.12 per cent in dollar terms during April-September 1990. This dropped to a negative average monthly rate of -25.61 per cent during April-September 1991. In November 1991 the negative rate was at -41.25 per cent.

13 Liquidity surplus indicates a primary excess of exchange reserves including unutilised quotas at the IMF above payments due next six months and second line reserves (which includes unused credit payable by banks over next six months). As a contrast the payments gap signifies covered (excess of debt payments over unused liquidity) as well as uncovered (one where debt payments are not covered by available liquidity).

Science and Ethics in Public Decision-Making

Case of Big Dams

K Subramaniam

An attempt is made in this article to unearth some of the values which form a background to the undertaking of a large technological project like the Narmada dam. Specifically, the author presents an argument defending the common property right of the project-affected persons over forest land.

THE main issues in the controversy over the Narmada dams have been discussed widely and intensively and are relatively well reported in the popular media. The first part of the article briefly touches on a few arguments that appear to me to be the strongest both in favour of and against the dam. The issue of the indirect costs and benefits of the dam and their relation to the cost-benefit analysis is discussed. I point out one way in which science and values combine in the cost-benefit analysis. In the second part, the focus is on the background consensus about rights that informs technological development. Specifically the article defends the common property right of the project-affected persons over forest land. Throughout the attempt is to unearth some of the values that form a background to the undertaking of a large technological project like the Narmada dam.

I

To begin with, there are two major kinds of criticism of the Narmada dam projects. The first is that the project is misplaced, pointless or ill-conceived. This kind of criticism tries to kill the project before it leaves the drawing board. The other criticism doubts the ability or the intention of the various government bodies in seeing through critical aspects of the project, even if the project looks good on paper.

In the arguments hurled against the supporters of the dam, these two criticisms are often as closely bound together as lead and powder. This is justly so because any project can be made to look good on paper if a sufficient number of ground realities are ignored. However, it is useful to bear this distinction in mind since neglecting it leads often to the pro- and the anti-dam sides speaking at cross-purposes.[1] It also reminds us that in calculating the benefits of the dam a certain deduction would necessarily have to be made to account for improper implementation of the project. When to discount and how much to discount are fine judgments requiring some expertise in, among other things, political sociology. Another reason why the distinction is important is that it suggests that the strongest arguments against the dam are of the second kind, relating to implementation, and these are also more difficult to appreciate. We may recall that improper implementation and inadequate preparation were the main reasons why the World Bank withdrew from the project.

If the approach to implementation speaks clearly against the case for the dam, one of the strongest arguments for the dam comes from a consideration of the national demand for water in the present and in the future. The argument is well-formulated by Ramaswamy Iyer in a perspective paper [Iyer 1990]. The main point is that large and small dams are not technically exclusive alternatives and they may both be necessary. If the objective is specified as impounding or making available a maximum amount of water, then the case for the Sardar Sarovar dam becomes strong.[2] Also, if it is recognised that large and small projects have both to be constructed in order to meet the national demand for water, then the question reduces to one of time-priority between the two. Here other considerations begin to enter. Some are questions of value and others are questions of fact. Shall we leave for the future capital infrastructure in the form of a large dam and the associated burden of debt (supposedly small for the Narmada dam)? Or shall we leave them the responsibility of raising financial resources to construct the dam? How do small, medium and large dams compare as capital stock? How effectively will the money spent be utilised in the competing alternatives? (The internal rate of return is taken as a convenient measure of this aspect). It is with regard to the time-priority of the alternatives that many people think favourably of the Narmada dam. There are implicit beliefs operating here that do not always find clear expression in the literature available—beliefs having to do with the effectiveness of the large dam in the short or medium run, beliefs that the large dam is a more important form of capital stock, beliefs that a large, visible project will ensure more effective spending and so on.[3]

Many of these issues cannot easily enter into the standard assessments of costs and benefits. But these considerations can decide what objectives are to be pursued, which is an exercise that precedes the cost-benefit analysis (CBA). It is important to note the way in which the CBA has actually been done for these dams. Generally the CBA is taken to be a technique that enables one to decide between well-developed alternatives pursuing the same goals. It is essential that the alternatives which are compared are reasonably well-developed, since that affects the cost calculations. However, in the case of river valley projects in India such as the Narmada dams the CBA is not employed to compare well-developed alternatives. The purpose of the CBA is to arrive at the benefit-cost (B-C) ratio for the sole project proposed. If the B-C ratio turns out higher than the accepted norm of 1.5 the project is considered viable. In all cost-benefit analyses, since the total costs computed do not generally indicate real costs, but rather indicate opportunity costs, it is essential that alternatives are considered. Further since the estimates involve so many points of interpretation, if there is a sole project in the race, there will be implicit biases acting to work out a favourable B-C ratio. Moreover, ignoring alternatives allows one to refrain from specifying what the basic objectives are. A lack of clarity about alternatives also implies a lack of clarity about what common goals or objectives these alternatives are meant to satisfy. The approach actually adopted is of course very suitable to the government agencies since they are able to disown the responsibility for developing alternatives. The responsibility is then charged to the critics of the dam who are ill-equipped to develop alternatives.

Costs and Benefits

Many aspects of the CBA have been subject to critical analysis and debate. I shall focus only on one such issue, namely, the range of costs and benefits that enter into the analysis. One of the most important issues in the debate has been the estimation of indirect costs and benefits. This issue is complex and its consideration seems to lend support to both sides. While the anti-dam group believes the indirect costs to be too high, the pro-dam group believes the indirect benefits to be very high. There have been at least three rounds of CBA commissioned by the government. The standard direct costs taken into account are the costs of construction, the cost of rehabilitating project-affected persons and the loss of revenue from the forest land submerged. The

direct benefits calculated are the increased yield in agricultural production and the yield of electrical power.[4] The indirect costs are broadly identified as environmental costs and social costs. The latter term is misleading because it refers often not to the cost borne by the builders of the dam but by the people affected by the project. Social costs borne by the people who just happen to be living in the submergence area cannot be justified even if it means benefits for a large majority. The costs for the people must be converted into costs for building the dam by applying the principle of compensation.[5] Only in this way can social costs appear in the CBA and to let it appear as costs borne by the people is misleading. The indirect benefits of the dam are the various spin-offs resulting from added agricultural output and electrical power. As can be envisaged, such indirect benefits can be vast.

There is, however, a certain asymmetry between the indirect costs and the indirect benefits. If, for instance, compensatory afforestation is undertaken to reduce the cost of loss of forests, there are many additional factors affecting the success of such afforestation. There is an uncertainty surrounding each of these factors. These uncertainties act in such a way as to reduce the effectiveness of the afforestation. As a general principle, one might say that the uncertainties act in such a way as to increase the costs and to reduce the benefits. This suggests that the weightage given to costs must be greater than the weightage given to benefits, because we are more certain that the costs will turn out to be what we expect, but the benefits will generally not meet expectations. This asymmetry is based on our experience of past projects and hence is known through empirical investigation.

There is another kind of asymmetry between benefits and costs. We might express this by saying that one must travel much farther along a causal chain while considering costs than while considering benefits. For example, at a future date, it may be found that soil erosion in a certain location due to the impounding of water and other effects has become a major problem, imposing its own set of fresh costs in the area. Then these costs, or at least the cost of implementing soil conservation methods, get added to the cost of the dam. Similarly, the increased incidence of water-borne diseases might necessitate the introduction of public health measures. The costs of such measures again would get added to the cost of the dam. However if the economy were to receive a boost through a combination of secondary effects of the dam, we would not attribute it directly to the dam in the strong sense in which we would attribute the secondary costs to it. This may not seem evident at first, but becomes clear if we look at it from the side of policy formulation. We are quite justified in asking that policies regarding health control measures or soil conservation be included in the plans for the dam construction. But we do not feel equally pressed to ask for the inclusion of policies concerning secondary effects of increased agricultural output or electrical power. We only say that the project creates certain opportunities and makes certain things possible and it is left to contributions from other quarters to realise these benefits further

An example might make the point clearer. The dam clearly increases the irrigation potential and also definitely agricultural production. But in order to translate the increase into the prime objective of increased food production, the cropping pattern that is actually followed must be appropriate, that is, food crops must not yield to cash crops when the fields are irrigated. Similarly there is a general agreement that the measures for draining the command area of excess water are a major factor affecting agricultural production. In the case of the Narmada project drainage of the command area is not included in the plans and policies for construction of the dam. Instead drainage, perhaps justifiably, has been left to the care of private farmers. Similarly the availability of electrical power would presumably lead to a growth in industrial production A good part of this expansion in industry would feed the expansion in agriculture and would process its harvest[6] Whether the industrial growth would also lead to other social benefits like net increase in employment is determined by the action of mitigating factors such as the trend towards modernisation and the shifting and relocation of capital away from developed urban regions

I am not claiming that these factors would prevent the realisation of the secondary benefits of the dam I am only pointing out the complexity of factors that would necessarily operate in determining these benefits And because of this we rightfully limit the scope of the plans and policies having to do with the dam construction, as in the example of the drainage of the command area mentioned above. While planning for the dam we keep a certain target effect in view, and leave all the rest to independent acts of planning. Should we not therefore limit also the range of indirect benefits that we consider in the cost-benefit estimation? I think we are justified in imposing this limit and acknowledging this asymmetry between benefits and costs partly because we implicitly recognise that the higher order benefits may be realised in other ways. Again this asymmetry like the earlier one mentioned seems to be because of the presence, in the casual chain on the side of the benefits, of a large number of external factors, many of which call for fresh and creative inputs. It is the intervention of human creativity in the causal chain that I wish to emphasise here.

The view that through the multiplier effect the indirect benefits of the dam are enormous even if we are not able to formulate it properly is one of the strong implicit arguments in favour of the dam.[7] We ... however that when it comes to a cost-benefit analysis we generally restrict the range of indirect costs and benefits and draw boundaries around what it is acceptable to include. We may call this process of restricting a cost benefit analysis 'moduling'. Certain effects taken together with the proposed act from a module, a self-sufficient whole that must be evaluated solely in its own terms. For example, when it is suggested that we limit ourselves only to the direct costs and benefits, this is a proposal to module the cost-benefit analysis in a certain way, which of course is too limited. In the process of 'moduling' the CBA notions of responsibility, i e, considerations of what benefits the dam is responsible for, what we owe to the dam play an important part. Such responsibility is fixed by the importance we give to the contribution made by the dam itself relative to other factors in effecting certain benefits, and hence involves value judgments. The importance of the other factors rises when we consider them to involve creative components and consequently we module the CBA over a smaller range of benefits. Thus considerations of value enter the CBA not only in the way that common sense tells us—i e, how we quantify the costs and benefits depend on how much we value them. Value considerations enter the CBA through another not very obvious path—that is considerations of how to module the CBA.

It must be said however that in principle the estimation of costs and benefits may turn out to favour the dam. Then the second major issue of the debate over the dam moves to the centre· the displacement of people living in the submergence area of the dam. If analysis reveals the social necessity of constructing a big dam then the acquisition of land for the dam is justified since it is for a public purpose. Here the examination of the rights of the project affected persons becomes important because the extent of these rights determines the extent of compensation. The present amount of compensation (over and above an absolute minimum specified) is determined on the basis of how much land is privately held by the displaced individual. If the arguments that I present below in favour of recognising the common property rights of forest-dwellers are correct then the present compensation is grossly inadequate. It is to this defence of the tribal rights that we shall now turn.

II

The conflict of value over the Narmada dam is readily interpreted as an example of the familiar conflict between distributive justice and individual rights. The project, it is said, benefits a large number of people and is distributively just, but then, it infringes on the rights of others. The two aspects of justice are supposedly enshrined into two parts of the Indian

Constitution often seen to conflict with each other—Part III dealing with fundamental rights and Part IV dealing with the directive principles of state policy. The conflict between the two parts has a chequered history in post-independent India and is widely known and written about.

Of all the fundamental rights listed in Part III of the Constitution the most disputed is the right to property. The dispute about the status of this right may be traced even to the time of the drafting of the Constitution where it revolves around two foci—the general socialistic orientation of most of the founders of independent India and the concrete issue of the zamindari holdings.[8] The path chosen by the drafters of the Constitution, and subsequently by the legislatures, has aimed not at carefully defining the term 'property' and classifying various kinds of ownership, but at weakening the right to property itself. The sequence of amendments to the Constitution, motivated by a desire to keep the land acquisition issue out of the purview of the courts, found a culmination in the 44th amendment passed in 1978. The Janata Party-led legislature, with this amendment, removed the right to property from the list of fundamental rights written into the Constitution.

The suggested conflict between the two deep principles of justice, namely, of individual rights and distributive justice, might urge a conclusion that the issue is morally undecidable. One might conclude, like Alisdair MacIntyre, that there is really no shared moral language or framework since we believe in conflicting and incommensurable moral principles [MacIntyre 1984]. There are however alternative approaches to the issue. Even the interests of the majority of the people expressed in the principle of distributive justice may be formulated in the language of rights. A more sophisticated theory, that bases even the principle of distributive justice on a framework of right to holdings and entitlements, is presented by R Nozick in his important book *Anarchy, State and Utopia*. Nozick (1974) presents very strong arguments against patterned distribution principles, that is, external moral principles that specify what a just distribution is. Some examples of such principles mentioned by Nozick are, to each according to his needs, or moral merit, or effort, or marginal product, etc. Opposing a definition based on such principles, he defines distributive justice as the possession by everyone of holdings they are entitled to [Nozick 1974, p 151]. In other words distributive justice is itself based on the right to property.

The term 'fundamental right' refers to rights that the citizen might hold against the government. The government cannot interfere with the exercise of the right except under very special circumstances. The right is protected even though it may be clear that the majority would be better off if it were curtailed. This is because rights are believed to have a de-ontological justification grounded in the notion of human dignity or of political equality [Dworkin 1977, p 198]. It is important to remember however that some of our strongest notions about what people's rights are may not find a place in our constitutions. Dworkin distinguishes between background rights and institutional rights. Background rights may provide justification for political or legislative changes, but are not protected within the given legal and institutional framework and are therefore weaker than institutional rights. Amartya Sen points out that the right to livelihood, as it is found in the Indian Constitution, has a form even weaker than the background or abstract right [Sen 1981]. In its directive principles of the state policy all that the Constitution grants to citizens is the right to a policy directed towards securing the right to adequate means of livelihood. Sen calls this weakest form of all rights a 'metaright'. He goes on to argue that most cases of starvation and famine in the world are not a result of people being deprived of what they are entitled to, but a result of people not being entitled, within the prevailing legal system of institutional rights, to adequate means for survival.

STATUS OF SPECIFIC RIGHTS

The role and significance of rights in protecting justice, and the need for a serious discussion about the status of specific rights is, I hope, clear from the points made by Sen. What is the status of the right specifically relevant to the dam controversy, that is, the right of forest-dwellers over common property? Chatrapathi Singh complains that the last serious discussion about the rights of forest-dwellers in India dates back to the previous century [Singh 1986, p v]. This is indeed a surprising situation since much is spoken about the rights of the tribals. Singh's own work is a contribution concerning the various legal aspects of the issue of common property rights as it relates to forest land. Mention must also be made of the work by B K Roy Burman that reports the different kinds of systems under which tribal people exercise collective ownership [B K Roy Burman, n d]. In this article I shall briefly look at some aspects of the debate over property rights and I shall put forward some arguments that justify the right of forest-dwellers over forest land.

Legislation in India has over the years weakened the right to property. In spite of this, the compensation package awarded to the people affected by the Narmada dam project is one of the most progressive in our country till date. This indicates that there are other protective measures that independently safeguard the rights of displaced persons; perhaps the special safeguards meant for scheduled tribes have been effectively used. Compensation has been interpreted to mean an improvement or at worst a conservation of the quality of life of the displaced, and is not based upon market value or some other principle. Even though this step is progressive, the ruling understanding of what the tribals are entitled to is still based on the notion of private property or individual holdings. Thus a central problem in awarding compensation is of distinguishing between encroachers and owners. The entire issue of common property is ignored or only weakly stated.

We obtain some indication of the unsuitability of the notion of individual property right from the widely varying ways in which the notion has been brought to bear on the issue of project-displaced persons. The assertion that the right to property is a fundamental right is a premise both for claiming and denying that right to tribals. Those who interpret it against the interest of the tribals argue that the tribals never really developed a notion of property and did not consider the forests that they lived in as their 'property'. Hence the proprietary right over forests is vested with the sovereign or the state. The right of the state is further strengthened by quoting the doctrine of eminent domain, and also by tracing historical agreements through which tribal chieftains gradually acquired or transferred proprietary rights over forest land to the reigning power. The conversion of tribal common property into privately held land under settled cultivation is a common feature found to various extents in the tribal regions [Roy Burman n d]. Indeed, this is a phenomenon that spans a greater part of known history. This phenomenon of the gradual historical conversion from a tribal, forest-based economy to an agrarian one cannot however be taken as refuting or weakening the tribal common property rights, as I shall argue below.

Those who eschew references to the right to property (presumably because it has been omitted from the list of fundamental rights in the Indian Constitution) seek to defend the claims of tribals by invoking the fundamental right to life along with the implied right to livelihood [Sharma 1990, p 8]. Although the approach may seem pragmatically sound, it has been argued rightly that it only serves to weaken the notion of the right to life, which is best invoked in cases involving its direct violation, given the extreme gravity of such violations [Singh 1986, p 40]. Secondly, while the right to life is acknowledged as fundamental, the derivation from this of the right to livelihood and of the right over material things is not automatic but contains a proviso. What may be derived from the right to life is only a right to a minimal livelihood, but beyond that I have a right to the material things necessary for my livelihood provided it does not violate someone else's rights. This clearly is not as fundamental as the right to life [Nozick 1974, p 179n].

What is the nature and extent of the tribal people's rights over forest land as it is recognised by our legal system? It is relevant here to distinguish between the re-

gions where the tribals have mostly converted to settled cultivation and where shifting cultivation is still dominant. In the former regions collective decisions regarding common use of land is a practice that is found less frequently and is less important than in the shifting cultivation regions. Whatever the internal social and political organisation of the tribals, the dominant outlook at present is to recognise the ownership rights of tribals only over the plot that is settled and cultivated. In addition, their right to minor forest produce and some timber for personal use is also acknowledged. Their right to sell forest produce virtually does not exist, save in a few states which allow them to collect and sell minor forest produce. (In many areas, it must be noted, tribals are allowed to cultivate plots only for limited periods of time, entirely at the pleasure of the forest department. This ensures that labour is readily available to the department for forest-related works. No rights of such people are recognised even over the plots they cultivate.) With regard to the areas where shifting cultivation is present, the approach is one of imposing restrictions on this practice and encouraging a shift to settled agriculture. Here too, there is no recognition of a common proprietary right over forest land [9]

The basic grounds for recognising the proprietary right of the tribals over forest land is that traditionally such a right has been exercised by tribal groups collectively. The close identification with and the sense of belonging to the forests of the tribals point to the existence of such a right. I shall now consider some objections which taken together seem to negate the proprietary right of tribals over forest land

(1) The argument that the sovereign is the sole owner of all land within his territory: Although this argument is not intended as a justification of the proprietary right of the state over forest land it has played an important part in the historical process by which such a right has become vested in the state. Singh cites the argument made by justice Blackburn that aboriginal rights over land extant before conquest or settlement do not survive the establishment of another sovereign power [Singh 1986, p 27]. Thus the tribals would forfeit whatever rights they held under the rule of their own king, when the king or chieftain acceded to or was conquered by another power. This may possibly be premised on two beliefs: that conquest creates new rights for the conqueror or that a tribal sovereign or chieftain holds a higher proprietary right over the land possessed by the members of his tribe.

Only the latter proposition is justifiable, and that too on the same grounds and under the same conditions that are recognised to hold for the doctrine of eminent domain which I shall consider below. However, given the nature of the tribal economy, it is doubtful whether one can interpret the tribal chiefs as having a right over and above the members of the tribe. Rather, it is the case that such an interpretation has been used by outsiders and conquerors to introduce the notion of private ownership of land into tribal societies [Roy Burman n d]. The argument needs to be mentioned because it is taken to add historical weight to the present situation where the proprietary rights over forests are seen as vested solely with the state.

(2) The principle of eminent domain: The principle states that the state has an absolute right to acquire land and its resources under two conditions (a) Wherever public purpose or national interests override personal or communal interests and (b) where there is a payment of due compensation to all people who are deprived of their rights. The two conditions are important and are recognised as a necessary part of the doctrine. Indeed they are stressed even in the first enunciation of the principle by Grotius in 1625 [Singh 1986, p 24].

It is important to note that this principle is applicable even when no prior negotiated settlement exists between the state and the persons deprived of rights. If such a negotiated settlement were existing, it would simply be a case of the persons holding land exercising their own right of exchanging it freely for payment and other benefits. The validity of this principle, which I take as evident, depends crucially on the two qualifications that are attached to it. The principle also points out the importance of examining the terms of the compensation and the extent of the entitlements of the tribals.

(3) The argument that forests inhabited by the tribals are not really property and that their right is not a real right of ownership: The form in which this argument was stated in the previous century by Brandis and Baden-Powell is seen now to be inadequate [Singh 1986] They advanced the argument by citing assertions of absolute rights over forests by non-tribal Indian rulers under whose domain the forests fell. These assertions were generally made for purposes such as the demarcation of hunting reserves. However some cases, where the rulers arbitrarily extinguished customary rights, were also cited in support of the argument by Brandis and Baden-Powell. More recent anthropological and historical work shows that the practice of the Indian rulers was not to interfere with the lives of forest dwellers. The assertion by them of proprietary right over forests generally made no real difference to the forest-dwellers and cannot form a model for assertions of proprietary rights by modern governments [Singh 1986, p 10].

The more general form of the argument, that the prevalence of common property right is not a historically stable form of social organisation has a wide currency and influence. This position is adopted for instance by Shepherd, who insists on seeing the prevalence of common property right as "a transitional stage between open access resources and private property" [Roy Burman nd, p 29]. Shepherd enumerates three factors that induce a breakdown of common property right: (a) When the value of a common property rises so does the vulnerability of the common property right; (b) a greater degree of wealth differential within the group holding a common property right induces change, and (c) the local authority is undermined more and more by the modern state, and the enforcement of common property right breaks down leading to cheating and private appropriation by wealthier individuals of the group.

In order to rebut this argument Roy Burman calls for a close study of the historical aspects of common property right holding across the globe Such a study will certainly reveal examples where common property right has been institutionalised and accepted into the formal legal structure, and repudiate Shepherd's claims about the inevitable breakdown of common property right. One cannot however adopt a purely historicist stance as Roy Burman does: "Until comparative data in a more complete form are available for several regions of the world, situated in diverse historical ecological settings, one will have to keep one's judgments (about whether Shepherd is right) in abeyance" (pp 30-31).

One would rather have to be guided by principles of justice in accepting the validity of common property right. After all, even the progressive legislations protecting the rights of the indigenous people have been occasioned by a problem that has become especially acute in the present world. With the growth of population and awareness, there is no 'free' land available, and indigenous people cannot any longer retreat into deeper forest under pressure from outsiders. Land has become useful in new ways and has hence become scarce. Claims over land in most parts of the world are settling into certain patterns. The claims of indigenous people over common resources are increasingly coming into conflict with other sections of society Such a situation calls for an interpretation of customary tribal practices in terms of common law and the formal notion of property-right, that is sensitive at once to the indigenous point of view and to the ends of justice. Only by an act of interpretation can the rights of indigenous people be brought within the framework of modern legal systems where such rights can be protected To insist, as some courts have done, on a proof that local law ('lex loci') existed among the indigenous people in a form recognisable by modern law, and that such local law protected the rights of the members of the tribe is to open loopholes in the issue. It has only provided those defending the state's rights against the forest-dwellers with an additional strategy: of proving that no recognisable form of local law existed [Roy Burman nd, p 9). This supplements the strategy of showing 'treaties' by

which tribal chieftains ceded land to the reigning power.

It is important to note that the argument that outsiders have settled on forest land and hence the forests are not the property of indigenous people, to an extent, has a force independent of the manner in which such possession or acquisition was effected. Therefore even if the tribal chief conceded land to outsiders in violation of the collective rights held by the tribe, it does not weaken the right of the outsiders over such land, and the argument that the forests never really belonged to the tribals as property can be advanced. The independent force of the argument arises from the recognition that the facts of possession or non possession themselves establish or extinguish the right of ownership. Here the argument would be essentially negative: if the tribals failed to restrict outsiders from possessing and holding land, they failed to exercise any right of ownership. By implication and extension it is also believed that the tribals do not exercise and therefore do not cognise any rights over forest land in general. (This, of course, excludes the cases where some form of resistance was actually made by the tribals to the settlement of outsiders.) This argument has the effect of turning the acquisition of forest land by outsiders into a form of original acquisition. By implication, the assertion by the state of proprietary right over forests also becomes a form of original acquisition. The forest is then seen as a free natural resource not subject to any prior ownership claim.

The limitation of this argument arises from the fact that, while the relation of the tribals with the forests permits acquisition and use by outside individuals to a certain extent, it does not follow thereby that their ownership claim stands negated and that the inhabited forests are a free resource. If the tribal is indifferent to taking of an inch it does not justify appropriation of miles of forest land. Even original acquisition as formulated by Locke is not an entirely free act, it has a proviso. Original acquisition is justified provided it does not worsen the situation of others. The phrase 'worsen the situation of others' is itself interpreted in two ways. In the strong sense every acquisition worsens the situation of others by limiting their possible future acquisition. In the weak sense the situation of others is worsened by limiting or restricting their use of the acquired property [Nozick 1974, p 176]. The strong form of the proviso, if it is consistently applied, can be shown to rule out all original acquisition. Hence only the weak form of the proviso is relevant. By the weak form however, the state, as long as it provides rights of use (of forest products) to the tribals, is fully justified in establishing its right over forests by an original acquisition.

There is however a kind of right recognised by the tribals that cannot in any sense be interpreted as a user right. This is the right to permit younger members of the tribe to clear and settle forest land. The forest is owned with the understanding that future generations have the right to clear and settle parts of it. This right, analogous to the right to bequeath one's property is really part of the right of ownership. Thus, even though clear demarcations and boundaries may not exist for the forest land collectively owned, and the settlement of land by outsiders may be tolerated to an extent, it does not indicate that the exercise of ownership right was entirely absent. The presence of this right is implied by the conscious holding of forest land for clearing, settling and use by future generations.

(4) The argument that the life-style of the tribals includes practices that are destructive of the forest and therefore the environment: Practices such as rearing animals and shifting cultivation are seen as leading to destruction of the forests. Ironically, those who support tribal rights use exactly the opposite argument—that the tribals have a life-style that respects and protects the forest. How do we reconcile these conflicting claims? It is true that in certain regions shifting or slash-and-burn cultivation is having a destructive impact. This does not however mean that the state can take away existing proprietary rights of the tribals. It only brings forth the need to impose appropriate restrictions on such practices. Further, if we take as examples the worst cases where tribals have failed to protect the forests, we must compare them with the worst cases of forest management by the forest department itself. This old and familiar principle would restore a balance of perspective.

If we acknowledge that the tribal people had evolved a form of life that allowed them to inhabit the forests and to completely depend on it without destroying it, then that fact alone seems to me to be extremely significant. Not only is such a life-form possessed of an intrinsic worth owing to its strangeness and difference from other life-forms. It also has a social function in an age where the need for conserving and increasing the extent of forests is so poignantly clear. I shall state without argument that this alone entitles tribal people to rights over forest land more than any other group of people. Such rights must be taken cognisance of in a world with a vast and growing population where right over land is fast freezing into certain patterns of holding and where the principle of original acquisition has a minimal applicability, if at all.

Notes

1 In the interview with S C Verma, chairman of the Narmada valley Development Authority, by R Billorey and S Sarangi for example, Billorey's criticism is largely of the implementation aspect of past projects. The officials generally counter the criticism by citing plans, estimates, etc [C Alvares et al, 1988].

2 For some counter-arguments, see Paranjpye, 1990, p 59.

3 Iyer makes the point that small projects have a number of practical advantages including the need for limited investments. He also notes that the user (farmer) bears a large part of the capital and operating costs and that hence the utilisation of the water resource will be more careful and economical. If his point about investment is correct, small projects cease to be alternatives competing with large ones (for funds) and there is no justification for not taking up small projects concurrently with large ones [Iyer 1990, p 84].

4 See Paranjpye, 1990, pp 147-52. Also see SSNL 1991, pp 73-76.

5 A person is fully compensated for a loss if it makes him no worse off than he otherwise would have been. The World Bank adopts this meaning of compensation [Morse 1992].

6 This is cited as one of the secondary benefits by R B Shah in "Role of Major Dams in Indian Economy", (Dhawan, 1990, pp 112-14).

7 This argument gains prominence of place in the World Bank's defence of the Narmada Project [World Bank 1991].

8 A comprehensive account is found in Narively, 1987.

9 For a summary of the situation see Roy Burman, 1982.

Exchange Rate and Trade Imbalance

Ashok K Nag

Ghanashyam Upadhya

THE article by Prabirjit Sarkar ('India's Balance of Payments and Exchange Rate Behaviour since 1971: A New Approach', January 1-8) shows that 'unit root' econometrics is fast becoming an indispensable and standard item in the tool-box of an applied econometri-cian. Sarkar's conclusions based on cointegration analysis of the real exchange rate and a few important real variables pertaining to the external trade sector go against standard neoclassical results. Prima facie it appears that deregulation of the foreign exchange market would not have the desired impact on the trade balance if the trade balance, itself being an unit root process, is found to exhibit no long-term relationship (linear relationship, to be particular) with the real exchange rate. So the policy of keeping the exchange rate deliberately undervalued, the current policy stance of the RBI, may turn out to be counter-productive insofar as such undervaluation fails to correct the external trade imbalance in the long run and on the other hand adversely affects the industrial growth process by making the cost of necessary imports prohibitive. Sarkar's results, therefore, provide empirical support to the hypothesis cherished by some that foreign exchange is a scarce resource the optimal allocation of which cannot be ensured through a deregulated market. If the empirical results obtained by Sarkar are indeed robust, serious doubts would ensue about the soundness of current policies. We, therefore, wanted to find out how robust or fragile Sarkar's conclusions are and in that process discovered some interesting aspects of our external trade regime which has escaped the notice of Sarkar. The details of our exercise follow.

DATA

At the outset we decided to use monthly data for a number of reasons. Firstly, it is unlikely that real variables like export and import would respond to significant changes in exchange rate with a lag of more than a year and these intra-year changes may contain important information about the relationship of our interest. Secondly, the small sample properties of the test statistic which we are going to use are still being explored and for the sake of having some power for our tests we wanted a reasonable sample size. Twenty-one data points look too small. Lastly, and most importantly, the external trade regime has been undergoing rapid changes in recent years and unless a reasonable part of the sample comes from this period we may fail to detect the emerging relationship if only yearly data are used. More on this below. As such our monthly data series range from January 1979 to January 1993.

If the monthly data on real export, real import, real export by real import (in lieu of trade gap) and real exchange rates are plotted, the visual inspection of the data clearly suggest that the multivariate process might have undergone certain structural changes sometime in the mid-80s (Figure 1). To be fair to Sarkar, he did look

FIGURE 1

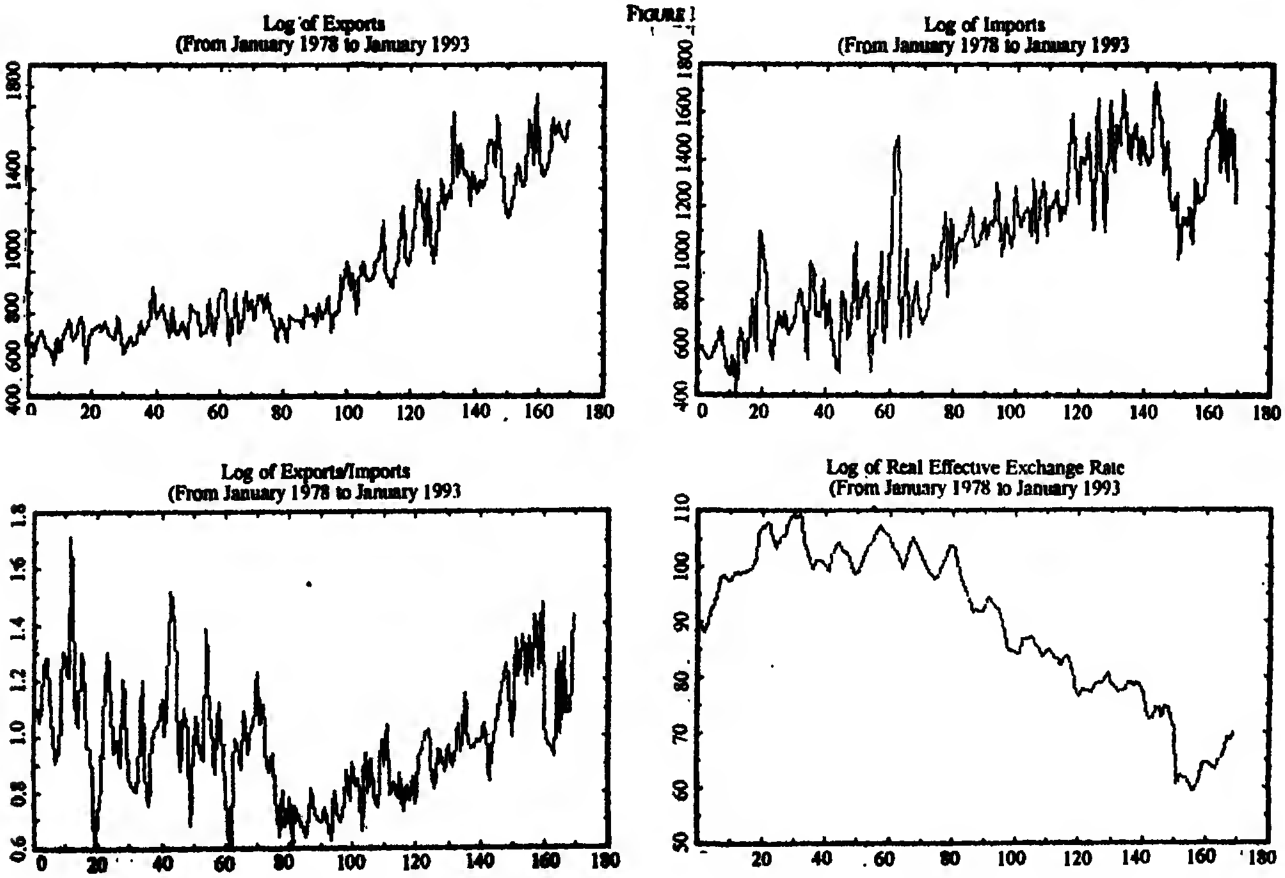

FIGURE 2

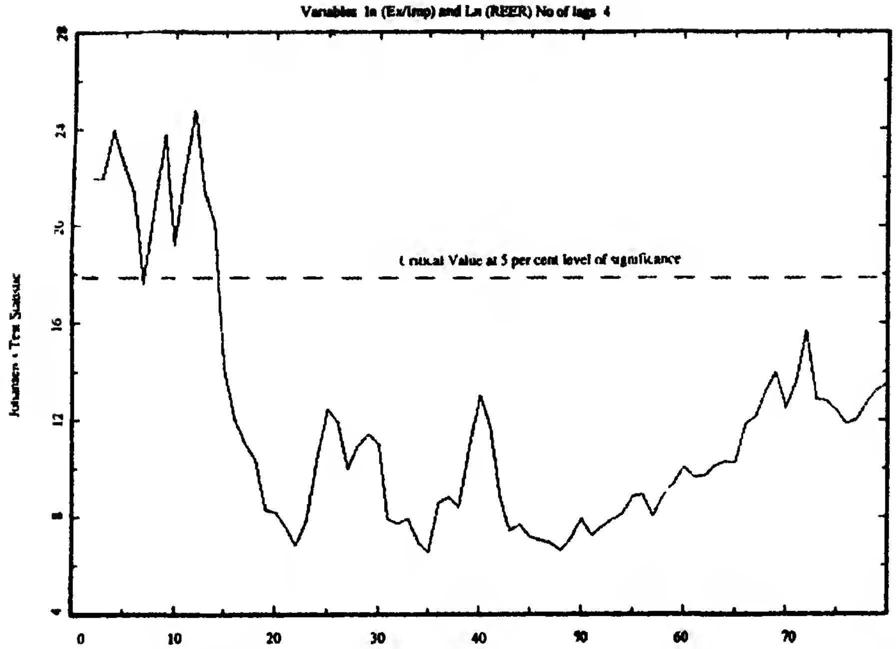
Variables: ln (Ex/Imp) and Ln (REER) No of lags 4



for structural changes in each univariate series, using Perron's 1989 method Since use of known break-points makes the standard Dickey-Fuller critical values suspect, we used sequential test as suggested by Banerjee et al (1992) for each individual series and like Sarkar could not find any structural change in any of them In other words each individual series is best represented by a single unit root process

COINTEGRATION ANALYSIS

We used Johansen's method to test for presence of co-integrating relationship among the bivariate variables—one being real exchange rate and the other one being one real variable (For a simple exposition of this method, see our paper in *RBI Occasional Papers*, March 1993) The initial analysis using the entire sample suggests non-existence of any co-integrating relationship as also obtained by Sarkar However, the situation changes dramatically when only the later part of the sample, i e, from July 1985 onwards, is used for the series balance of trade (export/import) In fact Figure 2 plots the Johansen's test statistic against size of sample, the size being increased in a backward fashion on the time-scale, starting with the sample period from July 1985 to January 1993 As can be seen from the figure, the null of non-cointegration is clearly rejected when we are confined to the later periods only. The strength of this relationship gets weaker and weaker as we go backwards and inclusion of sufficient earlier period data points completely masks this relationship We should point out here that a similar result is obtained if one uses Granger-Engle's two-step procedure for detecting co-integrating relationship These results are not reported here to save space

How does one reconcile this observation of ours with the earlier one of no structural break According to us what is happening is as follows

The individual series may not show any structural break but innovations in them may start getting correlated from a later period Since presence of cointegration is nothing but a statement of correlation about the innovation processes of two random walk process in the bivariate case, the full sample may fail to show this correlation if the earlier period innovations are uncorrelated and their contribution to total variance is sizeable.

According to us, herein lies the real reason behind the discrepancy between our and Sarkar's results. When the distortion in the external trade sector due to non-price factors is gradually being minimised and when the exchange rate starts getting determined through the market we expect innovations in variable reflecting trade balance to start getting correlated to the innovations in real exchange process For this relationship to show up, the period from when this phenomenon gets going should account for a substantial portion of the sample And that is why the absence of any cointegrating relationship is rejected in favour of presence of one when we use the data pertaining to that period effectively. In other words exchange rate matters

Three generations of small savers. There's one thing they all trust–Units.

Even people generations apart think the same way when it comes to Units Because Units help make their dreams come true

Whether it's a young man saving for a house of his own Or an older man looking forward to a comfortable retirement Or a little girl dreaming of becoming a doctor some day

Unit Trust has schemes to meet every need Whether the need is for high growth or liquidity Whether it's tax benefits or good returns coupled with insurance cover

People know that with Unit Trust they can get what they want That is why the number of Unit holders is going up so spectacularly To over 33 million today Most of these people are small savers They come from every part of the country They come from every walk of life They have different needs, different dreams

But they share the same abiding confidence in Unit Trust Living up to this confidence is what keeps us going And growing

UNIT TRUST OF INDIA

For your better tomorrow.

Two Markets

While it is widely acknowledged that the existence of two different types of money markets, one organised and the other unorganised, has important implications for the conduct of monetary policy in less developed countries, there are a number of important issues which have not received the attention they deserve in discussions of dual money markets. For instance, what role does the market structure play in explaining the emergence of dual interest rates? Do interest rates in the organised market affect those in the unorganised markets? 871

Land Reform and Co-operatives

The limitations of land reform lay the structural foundations of the limitations of rural co-operatives and the green revolution. Where land reforms have failed to remove the non-cultivating groups and establish cultivating owners, the groups which need co-operatives have not emerged. Agricultural transformation has also remained elusive in such areas. 863

Industrial Sickness

Sweeping generalisations, such as those offered by the Committee on Industrial Sickness and Corporate Restructuring, do not help in correct diagnosis and treatment of the malaise of industrial sickness. 833

Blood Bond

The steady fall in the status of women in upwardly mobile groups in rural Tamil Nadu and growing anti-female bias in such 'progressive' groups which are benefiting from rural development is closely linked to change in the marriage system within these groups which has greatly weakened the importance of matrilateral kin in Tamil kinship. 855

Threatened

Vital economic sectors linked to micro-organisms—agriculture, pharmaceuticals and industrial biotechnology, to name the most important ones—will be severely affected by the acceptance of patents on micro-organisms under the new GATT agreement. 841

Minority Identity

The laboured distinction sought to be made between 'Islamic modernists' and 'secular modernists' will be of no consequence in the long run. Muslim Indians must seek their destiny within the national framework of the secular state and the international framework of the rights of religious minorities in an increasingly shrinking world. 876

Gandhi Today

There is need to redefine Gandhi in a modern context: to preserve the values, but come to terms with the changes. Can the Gandhian movement address the issues that must be explored and understood to come up with an alternative framework? 843

Village Industries

In our traditional village industries we have in our hands the only relevant technology for the well-being of humankind, yet these industries are struggling against the consequences of long neglect now aggravated by the economic reforms. 845

Partisan?

The role of the police in communal riots has been a very controversial issue. A study of some major communal riots. 835

Confirmation

The report of the Goldstone Commission has confirmed the widespread belief about the active involvement of the South African security forces in fomenting political violence directed mainly against the ANC. 847

India-Nepal Ties

Demands for a review of Indo-Nepalese relations and suggestions that an Indian initiative is essential for giving a 'positive tone' to them have to be viewed against the backdrop of how the relations evolved over a century and a half of British colonial rule. 849

LETTERS TO EDITOR

Ethnocentric Science

ALTHOUGH Vasant Kaiwar's article (February 26) touched upon the effects of capitalism on science and technology, the stress was mainly on defeating the concept of ethnocentric science. This has made him stretch the concept of universality to an extent that leaves no place for specificity. In practice multidirectional development of science is always missed or is sidelined due to specific aspects like political situation, living conditions, natural surroundings, etc. Even though the concepts that develop may be universally correct, it is incorrect to claim them as the 'only' possible trend. Due to the political conditions and money power it is possible to undermine or eliminate all the other scientific trends if they are not amenable to the ruling power. By scientific, we mean any activity which can be verified by repetition irrespective of the pursuits of the experimenter. Specific developments would become universal as and when suitable conditions for the same are available everywhere. In the present condition when scientific activity is deeply interwoven with capitalist development and profit, only that science which is useful for this capitalist plunder is considered as science and all other scientific activity is clubbed along with the meaningless traditional activity.

For example it is well known that science of entymology had developed to a very great extent in China to detect earthquakes, when the sensitivity of seismic instruments then available was much poorer than the capabilities of insects. But this faculty was neither allowed to develop nor recognised by the organised sector of science. It has been recognised that for the topography of large parts of India small tank irrigation is more beneficial, cheaper and suitable than big dams. Although the scientific basis for the same can be verified and proved, the capitalist lobby in favour of big dams is able to dub these activities as traditional/backward, and impose its versions in the name of modern science.

While accepting the basic viewpoint (anti-ethnocentric science) of Vasant Kaiwar, it has to be understood that if this concept of universality is overstretched then the scope for any independent activity in third world will come to an end. Only the scientific activity acceptable or recognised by the west will be considered as science. The clever imperialists have already converted western science and technology into new sophisticated tools to plunder the whole world. Economic and ecological disadvantages in this are being dumped on the third world in the name of aid and development. Suitable ideologies are also being created to take care of intellectuals. It is unfortunate that Vasant Kaiwar is also getting trapped into this net by not analysing the Joseph Needham's contribution in this field. Through his meticulous research Needham has been able to prove the scientificity of many scientific activities in China and other third world countries. Ecological problems coming to surface all over the world have further enhanced the importance and relevance of considering specificity.

Kaiwar's overzealous attempt to defeat ethnocentric science has unfortunately put him into the new glamorous trap of imperialists, which is much deeper and more venomous than before.

CHANDER RAJU

Kalpakkam

Brundaban Chandra Raj

WE have learnt with deep grief the passing away of Brundaban Chandra Raj, president of Uttar Balasore Khyapanastra Ghati Pratirodh Committee (North Balasore National Test Range Resistance Committee) on February 23. He suffered a cerebral haemorrhage and died in a hospital in Balasore. Brundaban Raj spearheaded the united people's movement in the Baliapal-Bhogarai region of Balasore in Orissa which challenged the decision of the government of India to locate the missile test range in that area. This project involved the take over of 102 sq km of fertile land inhabited by nearly 50,000 people. The area is famous for its products such as coconut, cashew nut and betel vine besides paddy and other cash crops. Agriculture and fisheries provide natural sources of support for the well-being of the people of Baliapal. Brundaban Raj along with Gadadhar Giri, who died a few years earlier, mobilised the people threatened by displacement against the project. The Baliapal movement was at its peak during 1986-88 when many innovative methods of peaceful struggle were applied by them. This included preventing entry of government officials and their vehicles into the area and women squads taking the lead in mobilisation.

Thanks to the dedication of leaders such as Brundaban Raj, the voice of Baliapal was heard all over the country and the issues raised by the people's movement were echoed in the debates on development and displacement in other parts of India. Baliapal movement and its call for the struggle for people's rights over *Bheetamati* (habitat) became symbols of democratic movement in India.

Born in 1918, Brundaban Raj was an activist in India's freedom struggle and an underground organiser in the Quit India Movement. He was jailed several times and was tortured by the police. After independence, he shunned electoral office and remained a committed grass roots social worker. When the Test Range was announced he came to the forefront of the resistance movement and led it successfully preventing the location of the Test Range in Baliapal. In his death, the democratic movements in India have lost a great fighter. We send our sincere condolences to the Khyapanastra Ghati Pratirodh Committee and his close relations. We reaffirm our solidarity with the Baliapal people's movement and the cause which Brundaban Chandra Raj represented.

ECONOMIC AND POLITICAL WEEKLY

Export-Import Policy

THE revisions effected in the five-year (1992-97) export-import policy, though not earth-shaking, represent a further attempt to squeeze export surpluses from a sluggish economy. The five-year exim policy, introduced in April 1992, was radically revised last year in order to pay special attention to the growth of exports from agriculture and allied sectors. As many as 146 items were removed from the negative list of exports and export incentives were augmented through extension of duty drawback to 333 new items and improvement in the drawback rates for 84 products. While announcing the latest revisions, the commerce minister has said that last year's "measures have yielded handsome dividends" in the form of a 45.3 per cent rise in exports of agriculture and allied sectors, exposing the government's unconcern for the distortion of the structure of the country's export-import trade. Even the exports of so-called engineering goods consist, to the extent of some two-thirds, of products which are as good as raw materials.

In the latest revision of export-import policy, two steps which stand out in this respect are: first, expansion of the scope of the system of Special Import Licences (SILs) by including in its purview import of products hitherto in the negative list consisting of consumer goods, office equipment, spares and components of consumer goods, communication equipment, sports equipment, and health-related equipment as also gold and silver at concessional rates of customs duty paid in foreign exchange by holders of exchange earners' foreign currency (EEFC) accounts; and, second, permission for import of second-hand capital goods at normal import duty rates by actual users with a reduced minimum residual life stipulation of five years as against the earlier seven years; the requirement of a certificate from a chartered engineer has also been dispensed with for machinery up to Rs 1 crore in value. As many as 67 consumer and other goods are now allowed to be imported against the special import licences; these range from colour TV sets (30" and above), video cameras, air-conditioners (two tons and above) and refrigerators (capacity above 200 litres) to cordless and cellular telephones. In the capital goods sector, the permission for import of second-hand machineries is in addition to the Export Promotion Capital Goods (EPCG) scheme under which import of capital goods is permitted at a concessional import duty of 15 per cent subject to export obligation of four times the c i f value of imports in a period of five years. Under the latest revisions, this export obligation can be discharged even through third-party exports of products that have some nexus with the imported capital goods.

It has been estimated that the bulk of India's exports are import-dependent to the extent of at least 50 per cent. Hitherto such import dependence was primarily for raw materials and other inputs as, for example, in the case of cashew and diamonds where the import content is over 70 per cent. Leather manufactures look set to join this league. But the permission now granted for import of second-hand capital goods, the concessional EPCG scheme with the facility for fulfilling the attached export obligation through third-party exports and the drastic reduction in import duties on capital goods and on raw materials, spares and parts are, all put together, bound to raise further the import dependence of exports. Again, after the sharp devaluation of the rupee it was thought that there would be no need to continue the numerous discretionary incentives for exports. But while the substantial cash compensatory allowance was abolished, the many export incentives which continue, including some newly introduced ones, do raise the basic question of what might be the domestic resource cost (DRC) of the additional export receipts. This was a major subject of concern in the 1950s and 1960s and should remain so because the drain of domestic resources for promoting exports will erode real incomes in the economy. Currency depreciation and other financial incentives do not, beyond a point, add to exports; they only enhance the opportunity cost of export earnings. Apart from total exemption of export profits from income and corporate taxation and concessional rates of interest for exporters in general and the series of open incentives for 100 per cent export units and units in export processing zones, there is the duty exemption scheme under which imports used in export production are permitted duty-free under numerous schemes, including the value-based advanced licence (VABAL) scheme, the coverage of which has now been expanded from 2,212 products to 3,383. Yet another major concession now offered is the expanded list of consumer and other goods, including gold and silver, under the special import licence scheme as the premium on the goods earlier covered had dropped on account of the general import liberalisation. It has been estimated that the value of imports under SILs may go up to Rs 1,200 crore in 1994-95. This may not appear very large, but the objective seems to be to test the waters for opening up the Indian market for import of consumer goods, a pointer to which is provided by the latest *Economic Survey* which affects to be concerned that "Quantitative restrictions on import of consumer goods provide very high levels of effective protection to these sectors. This results in mis-allocation of investible resources away from sectors where the country may possess a comparative advantage." What is actually happening is that any comparative advantage that the country may have in high technology, knowledge-based capital goods industries is being systematically undermined. The concurrent throwing open of the economy to import of consumer goods will in due course complete the process of globalisation, so determinedly pushed by the developed countries, the transnational corporations, and the multilateral economic organisations. The pattern of the country's exports will progressively move in favour of agriculture and allied products and low value added industrial goods. No wonder, so-called export houses, trading houses, star trading houses and now super-star trading houses are expected to play an important part in the country's exports. The bulk of their exports will be third-party exports and, by their very nature, cannot belong to the category of sophisticated, knowledge-oriented products.

BJP

In a Quandary

NOTWITHSTANDING the BJP's recent anti-Dunkel rally, the party is obviously in the throes of grappling with a major difference of opinion on the issue within its leadership as well as among the rank and file. True to its tradition it is endeavouring to use these differences to project a stand on GATT which may be interpreted differently to suit the occasion by its members and constituents.

From the deliberations at its executive meeting at Hyderabad what has emerged is the refurbished party plank which now reads thus: 'Hindutva Ramrajya-Swadeshi'. In one sense of course none of the differences have been resolved, but in another all shades can now appear to function for the greater good of the party. At the start of the deliberations it was expected that the meeting would arrive at crucial decisions with regard to major issues. Among them was the question of whether, in the wake of the reversals in the last bout of elections, there should be a shift of focus from Ayodhya and the mandir issue. The impression that the BJP would underplay Hindutva had begun to gain ground especially in the wake of growing criticism within the party that it was this focus which had been detrimental to the BJP, especially in UP. To many it seemed that the shrill and strident 'call to Ayodhya' was not now sufficient to move the masses. Post election analysis in UP (*EPW*, April 2) clearly points to the fact that especially among the dalits and backward castes the 'masjid todo' stance had been rejected. Hindutva had to find a garb which was egalitarian and not so sharply divisive. This is what is being sought to be tailored now. Advani speaking at the end of the executive meeting affirmed that Hindutva was not a mere slogan, but the party's ideological mascot.

This means obviously that Hindutva will not be the main agenda in the forthcoming elections, but rather a construct of broader goals within the ideological garb. This is why the party's consensus stand on GATT is yet to emerge. On the one hand, the groundswell of opposition to the country being party to the agreement mitigates against the party taking a pro-GATT stand. On the other, it cannot afford to adopt the swadeshi strategies being systematically promoted by RSS and alienate industry and financial interests. Some of the party leaders, especially Vajpayee and Joshi, have been adhering to opposing India appending its signature to the agreement. Thus at the conclusion of the executive meeting, the committee formed to draft the party's economic resolution comprised all shades of opinion—Murli Manohar Joshi as well as the members of the economic cell, Jay Dubashi and S C Agarwal, and party general secretary K N Govindacharya. It put forward eight demands, but concentrated on analysing the budget. Apart from saying that the budget was prepared under the shadow of GATT and calling for a complete ban on the entry of multinationals into the consumer goods sector, it focused on such issues as what it saw as a neglect of defence, the need for greater transparency in the disinvestment package for public sector, government spending, etc.

The party also sought to acknowledge the lessons of the UP debacle by introducing what is being termed 'mandalisation' in the party. What this means is that in the organisational structure there will be a greater effort to induct backward and scheduled caste members. However, in clear recognition of the fact that its major support base comes from the upper and middle castes, it has been emphatically stated at various fora that the BJP's programmes cannot afford to be caste-targeted but rather that they would have to be pro-poor. The RSS however will continue with its programme of yatras in the tribal areas and its campaign to enlarge the Hindutva fold.

What this will mean in concrete terms will only emerge after the the party's conclave at Sariska. But the party is clearly in a quandary about what kind of relative emphasis it must put on the various issues and it may well resort to an election programme which will allow for greater flexibility than so far.

THE BUDGET

Sinking under Interest Burden

ONE item of central government expenditure which has registered phenomenal escalation in recent years is interest payments. In the latest budget gross interest payments are projected to rise from Rs 37,500 crore in 1993-94 (RE) to Rs 46,000 crore in 1994-95, absorbing 53.4 per cent of the projected revenue receipts. Of course, the increase in gross interest liabilities of the government need not by itself be a matter of concern if either the interest receipts of the government were also increasing or the government's current revenues were registering a matching improvement. The concern arises because neither seems to be happening with the result that the proportion of the government's current revenue which has to be earmarked for meeting its interest liability goes up.

The government's interest receipts have been going down rather sharply in recent years; they were as high as 70 per cent of gross interest payments in 1980-81, whereas in 1994-95 they will have come down to under 35 per cent. At the same time, the government's current revenues as a multiple of gross interest payments have been on the decline—from a multiple of 9.4 in 1980-81, these have come down to 1.9. If a government wants to keep its interest liabilities relatively low, it must either see to it that interest recoveries keep pace with the increase in its liabilities on that score or ensure that its non-interest revenues register a growth rate sufficient to match the expansion in interest liabilities. Otherwise the situation is bound to reach a point when the proportion of current revenues left after meeting the interest liabilities will not be enough to meet the government's other current expenditure commitments. The situation becomes worse if these expenditure commitments cannot be contained. Rising revenue account deficits are a necessary consequence.

This is precisely what the present finance minister's budgetary exercises have resulted in. The revenue account deficit has been on the rise during his tenure; from Rs 16,261 crore in 1991-92, it will have gone up to Rs 34,058 crore in 1993-94. The budget for 1994-95 expects to bring it down to Rs 32,727 crore, but going by the experience of 1993-94, the apprehension that it will in fact be much higher cannot be easily dismissed. The problem with the ongoing budgetary exercises is that the philosophy underlying them does not call for additional revenue effort; if anything it calls for reduced taxes—revenues are assumed to increase automatically as tax rates are brought down—whereas expenditures, especially non-developmental expenditures, are found to be impossible to keep within bounds. In the circumstances, it should come as no surprise if at the end of the new financial year interest liabilities of the government require an even higher proportion of the government's current revenues than 53.4 per cent. The present finance minister is trying to have the cake and eat it too.

INTEREST BURDEN

Self-Inflicted Wound

THE most debilitating impact of the structural adjustment programme on government finances is to be seen in the galloping interest burden. Over 90 per cent of the increase in the interest burden is attributable to internal debt and other internal liabilities. Amongst the internal liabilities, interest rates on small savings and provident funds have remained unchanged during the period and the fiscal incentives attached to them have been reduced. As a result, accruals under small savings in particular have been declining. The bulk of the additional interest burden on the central budget has thus emanated from increases in

yield rates on market loans and treasury bills.

During the last two years, there has occurred a sharp change in the interest rate structure on market loans and various types of treasury bill borrowings (91-day, 182-day and 364-day). In the case of market loans, not only have yield rates been pushed up but the maturity period of the loans has been drastically narrowed from the erstwhile maximum of 20 years to 10 years in the case of both the state and central governments. The yield rates on central government securities were drastically pushed up from 10.75 per cent in 1991-92 (first tranche) to 13.5 per cent in 1993-94 for 10-year securities. In fact, 20-year securities had been issued in 1991-92 at a yield of 11.50 per cent. While these sharp increases were effected in yield rates, the spread as between different maturities starting from three years up to 10 years was kept at a minimum—12.75 per cent for three years, 13 per cent for five years, 13.25 per cent for seven years, 13.40 per cent for nine years and 13.50 per cent for 10 years. What is more, even for treasury bills inflated market expectations of high discount rates were stimulated and implicit cut-off yield rates in auctions of 91-day treasury bills ranged from 9 to 11 per cent and those on 364-day treasury bills from 11 to 11.5 per cent. Thus what seems to have weighed the most in the fixation of the level and term structure of rates is the ideological concern with pushing the yield rates as high as possible so that they would appear to be market-related, ignoring the sovereign and bulk nature of these assets for banks and other holders and, more importantly, not considering the fact that the loans are intended to finance social and economic development through the central budget. It is this insensitivity to considerations of cost for the central budget on the part of the bureaucracy which has been most appalling.

Even state governments whose finances are in a perilous state have been made to pay a yield rate of 13.5 per cent on their market loans. Apart from the higher interest rates on market loans, the states have also been made to pay increasingly higher interest rates on central loans to them. Thus on their small savings loans from the centre the states paid rates of interest of 12 per cent in 1989, 13 per cent in 1991, 14.5 per cent in 1992, 15 per cent in June 1993 and 14.5 per cent in September 1993. Even on their plan and non-plan loans they now pay to the centre a rate of interest of 12 per cent compared to 10.25 per cent in 1991. The payment of interest by the state governments to the centre has thus shot up from about Rs 5,592 crore in 1990-91 (RE) to Rs 11,162 crore in 1994-95 (BE). A substantial part of the rise has been due to increases in the average interest rate on such loans.

The increased interest burden arising from higher interest rates can be gauged from the central government budget. Despite drastically reduced dependence on market loans, the centre's interest outgo on such loans has shot up from Rs 6,300 crore in 1990-91 to Rs 10,380 crore in 1994-95—an increase of 65 per cent compared to a rise of only 46 per cent in outstanding market loans (excluding converted loans). Interest payments by the centre on treasury bills alone would work out to Rs 10,506 crore during 1994-95 as against Rs 3,406 crore in 1990-91.

Against this background and the fact that there is such massive liquidity available in the financial markets—and when four reductions have been affected in commercial banks' maximum lending rates—the reduction in coupon rates now offered by the Reserve Bank on 10-year and five-year securities for conversion of 364-day and 91-day treasury bills from 13.5 per cent to 12.5 per cent and from 13 per cent to 12 per cent, respectively, should be welcomed. In fact, there is scope for reducing the rates by another half a percentage point and for widening the spread between maturities.

CONTRACEPTIVES

Case for Public Enquiry

THIS week, Upjohn of USA, in collaboration with Max Pharma, launched in Bombay the injectable contraceptive Depo Provera (DP), a drug which has been controversial since 1960s when it was first introduced in the US. In fact the history of DP from the stage of its experimentation and clinical trials to its marketing is an excellent case study of the manner in which drug companies have managed to put unsafe products into the market and how third world country governments have been pressurised into accepting unethical products.

Depo Provera is a contraceptive injection which is meant to provide contraceptive protection for three months. Its greatest advantage, when it was first introduced, was that once injected a woman could be assured of protection for the duration. Or, in other words, the medical establishment especially in third world country population control programmes did not need to follow up on the women who had accepted the contraceptive, unlike for other birth control measures then available, such as the IUD or the pill. But such was the enthusiasm of the company which developed Depo Provera that it hastily sought to fool the US Food and Drug Authority into issuing it a licence by fudging data and providing insufficient information on the drug trials. The irony is that even before the US authority could register the drug, it was being used extensively in third world countries, or rather being 'tested' on large numbers of women.

All this generated such a groundswell of opinion against the injectable contraceptive that in 1984 the US FDA was forced to hold a public enquiry, only the second time in its history, to decide on whether the drug should be licensed. Its verdict held that there was insufficient material to show that the drug was safe. For instance, the company's claim that there were no long-term risks associated with the drug was not supported with sufficient data. The long-term consequences of the use of the drug on cancers especially of the breast and the uterus as well as osteoporosis and atherosclerosis had not been well-studied either in animals or in humans. The US FDA did not license DP for use as a contraceptive until 1990. And this was in the context of the resurgence of anxiety about the population explosion especially in the third world and the fact that the latter had increasingly become cautious about licensing a drug which had not been registered in the country of origin.

In India, the Indian Council of Medical Research began clinical testing of the drug in 1974 but soon abandoned the trial, reportedly because of the high dropout rate and the fact that there were too many doubts being expressed about the drug. Subsequently, several attempts were made to either start clinical trials of the drug or to make it available in the market. By the 1980s the women's and health movements in India as elsewhere had come to the conclusion that contraceptives which took away control from the woman, and which could not be withdrawn if the user so wanted should not be allowed to be introduced in state family planning programmes. A main reason was that there was insufficient infrastructural support for follow up or emergency care and that the drugs had not been proven to be safe. Health groups pointed to several areas where no studies had been conducted at all such as, for instance, the effect of long acting contraceptives on infants being breast-fed by women who were on these contraceptives, return to fertility of women who discontinued after some years of use, effect of continuous presence of the drug in the blood, etc. This stand was also applicable to such other long acting contraceptives as Net en (another injectable) and Norplant, an implant.

Late last year in a remarkable and questionable move, making a mockery of all the data gathered by women's and health groups all over the world, the Indian drug control authorities licensed DP for contraceptive use and in October, Upjohn signed a collaboration agreement with Max India to produce, market and sell the drug in India. This week's launch meant to educate doctors on DP was a logical outcome of this process.

What is extraordinary about all this is that the drug control authorities and the ICMR have seen it fit to allow a controversial drug into the market when it is neither necessary nor essential. And significantly, the material presented by Upjohn at the medical conference earlier this week does not appear to remove the doubts expressed by the US public enquiry of 1984. The drug will reportedly be sold on the market on prescription and the company has agreed to undertake post-marketing surveillance Since neither the ICMR nor the drug control authorities are equipped to participate in this surveillance, it is unlikely that a company with a long record of unethical practices will conduct an ethical and honest appraisal of the drug on its own

The company's argument is that since it is not offered through the family planning network but is sold at a price (reportedly, Rs 120 per dose), women will be able to make decisions on their own. Experience has shown that given the nexus between doctors and drug companies, there is very little room for independent decision-making especially on the part of women. Alternative information cannot compete with the onslaught of the highly visible marketing techniques used by MNC-backed drug companies

Moreover, there are reports that Net en, against the introduction of which women's groups have gone to the Supreme Court, may also be available on the market soon—German Remedies has recently placed an ad in newspapers to this effect. The case has not been disposed of as yet. Is it ethically correct, even if it is legally so, to allow the sales of Net en?

In the circumstances, there is an urgent need to press the authorities to institute a public enquiry on both these contraceptives which have been on the world market for so long and have proved to be controversial in every country they have been introduced in

UTTAR PRADESH

Targeting Dalits

THE recent violent clashes between the police and angry dalits that rocked Meerut are now being attributed to land-grabbers who wanted to seize land worth several lakhs of rupees behind the facade of installing a statue of Ambedkar. The violence was sparked off, according to the dalits, when the upper caste people prevented them from installing the statue on a vacant plot (reportedly belonging to a housing board or, according to another version, to a panchayat) and the police came out in support of the upper caste people.

Whatever might have been the reason for the violence, there are several important questions that arise from the way in which the administration dealt with the issue in Meerut. If we accept, for the sake of argument, that land-grabbers supported by a few dalit politicians looking for political mileage were behind the conflagration, it needs to be asked why the administration refuses to be equally prompt in suppressing similar land-grabbing indulged in by touts and politicians belonging to the majority community and the Hindu upper castes? It is an open secret that land-grabbers under the protection of politicians instigate riots to oust the original residents of certain areas (who usually belong to minority or dalit communities) and then seize their lands to begin the lucrative business of building residential or commercial accommodation there. This familiar pattern of provoking communal or caste riots, accompanied by arson and looting of the homes of the victims, forcing them to flee, and followed by the occupation of their land, could be observed in the riots in the wake of the Babri masjid demolition in certain areas of Bombay and Calcutta and Muslim-dominated localities in UP towns. Curiously enough, in these cases of communal riots, the administration chose to ignore the actual culprits—the land-grabbers and their political patrons—and decided instead to apprehend a few minor criminals as a show of its concern for 'law and order'. During the communal riots that rocked UP following the demolition of Babri masjid, there were few cases of the police firing upon rioters belonging to the majority community (who ruled the roost for quite some time even after the imposition of president's rule in the state).

Yet now under a government run by a shaky alliance of dalits and OBCs, we find the same police suddenly waking up to the land-grabbers-politicians axis and using that as an excuse to fire upon dalits, killing at least two and injuring scores. The lessons are clear. First, an upper-caste dominated administration in the highly surcharged communal and casteist environment in UP will invariably gun for the dalits when they violate the 'laws of the land' (the same laws which are allowed to be violated by the upper caste gentry by the same administrators) Secondly, while fighting against this discriminatory policy of the administration, dalit organisations should take care to ensure that they are not utilised by unscrupulous anti-social elements and politicians By borrowing the nefarious tactics of their enemies, dalits would only damage their own cause

SOUTH AFRICA

Minority Apprehensions

THE declaration of the emergency in Natal province and the despatch of troops to quell the spiralling violence and the ANC's support for the action are certainly a sign of the times in South Africa. In the past month the state's forces have been used twice to put down anti-election violence: once against Afrikaner right-wing groups and the Boputhatswana royalists and now against Zulu royalist-inspired violence in Natal. These events spell out more vividly than ever the problems that will confront the government after the elections.

The decision to impose the emergency has come after the failure of the talks with the Zulu king on the issue of self-governance of the tribal areas of Kwazulu. The summit meeting of president F W de Klerk, ANC chief Nelson Mandela, the Zulu king and his uncle, the leader of the Inkatha Freedom Party, collapsed after the carnage in Johannesburg early last week. At least 51 people were killed and over 173 wounded when a march in support of the Zulu king turned into a blood-bath. But even before that it was evident that the talks could have been only a face-saving measure for the Inkatha Party which has become isolated in the processes leading up to the elections later this month. In the meanwhile, violence has escalated in Natal and surrounding areas. Although the Inkatha has registered for the elections, it is evidently doing its best to regain some political clout before the event, in which it is unlikely to make an impact.

The disarray in the Zulu Party is likely to pose more, not less, of a problem for the new government. While the imposing of the emergency in the troubled province and the employing of troops to quell the violence may seem the logical solution, there is the larger issue of how such violence should be dealt with in future. Moreover, while the Inkatha's alliances with the pro-Nazi Afrikaner groups may have petered out temporarily, that there is the unresolved issue of self-governance in these areas cannot be forgotten. The Zulus fear that the ANC will wipe out Zulu culture and society and that fear cannot be brushed aside. The ANC has ruled out, on principle, the concept of self-governance. However, there have to mechanisms which ensure that adequate representation is provided in areas where because of majority interests, minorities will feel threatened. This issue cannot be dealt with in a spirit of vendetta: it has to be addressed and resolved. It is in this context that the fact that the de Klerk government has not come down heavily on the now revealed network that existed between the state's forces and the Inkatha is of concern. There are obviously sections of the state's forces who will resent the ANC's authority and unless means are found for the expression of sectional interests, they may find unconstitutional and undemocratic ways.

Rathi Ispat

BELONGING to the P C Rathi group of companies, Rathi Ispat is engaged in manufacturing alloy steel and stainless steel billets and steel castings. The company now has plans to undertake an expansion/modernisation/diversification programme with a total project outlay of Rs 27.4 crore which will enhance the present capacity from 60,000 to 1,50,000 tpa. IFCI which has appraised the project is participating in the project by way of term loans and equipment leasing finance to the tune of Rs 5.6 crore. To part finance the project the company plans to tap the capital market in the second week of May with a public-cum-rights issue of fully convertible debentures (FCDs) aggregating Rs 21 crore. FCDs in the rights issue will be convertible at a premium of Rs 20 per equity share while FCDs in the public issue will carry a premium of Rs 25 per equity share on conversion. With part of the project already completed the balance is expected to be completed by December 1994.

Neuland Laboratories

Promoted by Dr D R Rao, Neuland Laboratories is engaged in the production of salbutamol sulphate, an anti-asthmatic drug, labetalol hydrochloride, an anti-hypertension drug and ciprofloxacin, a quinolone antibiotic, at Medak district, Andhra Pradesh. The company now plans to set up installed capacities for manufacturing 8 tpa of ketorolac tromethamine, 1.5 tpa of enalapril maleate, 60 tpa of rantidine hyderothamine, 12 tpa of norfloxacin, 6 tpa of ofloxacin, 12 tpa of pefloxacin and 36 tpa of ciprofloxacin. ICICI which has appraised the project puts the project cost at Rs 15.7 crore. To part finance the project the company plans to tap the capital market with an issue of equity shares of Rs 10 each at a premium of Rs 35 per share aggregating Rs 8.7 crore. While equity shares have been reserved of firm allotment basis to UTI, ICICI, SCICI and Morgan Stanley (at the same premium), the public issue opens for subscription on April 18.

Pantaloon Textile

Pantaloon Textile Industries which is engaged in the manufacture of blended fabrics, primarily trousers and suitings material under the brand name 'Pantaloon Expression' is entering the capital market with a public issue aggregating Rs 3.6 crore. Promoted by Kishore Biyani, the company belongs to the Pantaloon Fashions group and sells its products to established names such as One Plus One Creations (Cliff), Nims Apparel (Double Bull), Impex Enterprises (Moustache) and Mayfair Knitting Industries in addition to the group flagship, Pantaloon Fashions. The company now plans to expand its capacity from 5.3 lakh metres of fabrics per annum to 30.4 lakh metres per annum at a total outlay of Rs 8.5 crore. The public issue which consists of equity shares of Rs 10 each at par is to part finance the expansion project and will open for subscription on April 18.

SB and T International

A Bombay-based profit-making company, SB and T International is a 100 per cent export-oriented unit promoted by S K Sethi for manufacturing diamonds and coloured stones, studded gold alloy and jewellery like rings, pendants, bracelets, ear-rings, etc. The company now plans to double its capacity from the existing 408 kgs to 816 kgs at a total cost of Rs 7.9 crore. It has entered into a technical and financial collaboration agreement with SB and T Gem Imports Inc, USA which has also agreed to buy-back 75 per cent of the company's production for a period of 20 years. The company expects to commence commercial production on the expanded capacity by May 1994 and the projected capacity utilisation for the first year of operations on expanded capacity, i e, 1994-95, is 60 per cent. To part finance the project the company will enter the capital market on April 18 with a public issue of equity shares of Rs 10 each at a premium of Rs 40 per share aggregating Rs 5.9 crore.

Apple Mutual Fund

Apple Mutual Fund which has been sponsored by Apple Industries is coming out with a close-ended scheme christened 'Apple Midas Fund—The Goldshare'. This is a five-year growth-oriented scheme which will consist of five crore units of Rs 10 each and will be listed on the Bombay, Calcutta, Delhi, Madras, Ahmedabad and Baroda stock exchanges. Around 85 per cent of the proceeds of the fund will be invested in equity and equity-related instruments while the rest will be invested in debt and money market instruments. The fund which will announce its net asset value on a weekly basis in addition to making a full disclosure of its portfolio annually will open for subscription on April 12.

Shoppers Investment

An existing listed company, Shoppers Investment and Finance Company is engaged in the business of hire purchase and consumer durable financing. Promoted by G Mohan, the company already has branches in Madras, Mylapore, Tanjore, Trichy, etc, and has entered into an agreement with Reliable Hire Purchase Company for the use of the brand name 'Ready Money'. The company now plans to expand its operations at a total cost of Rs 11.3 crore and also market small-scale industries' products under its brand name. To part finance its plans the company is offering to the public equity shares of Rs 10 each at a premium of Rs 2 per share aggregating Rs 6 crore in addition to a rights issue of Rs 3.3 crore and promoters' contribution of Rs 2 crore. The issue which will reduce the promoter's stake to 26 per cent will open for public subscription on April 15.

Bombay Offshore Supplies

Bombay Offshore Supplies and Services (BOSS), one of the few companies engaged in the highly specialised and strategic oil and gas industry, has been promoted by P V S Sawhney for providing and indigenising specialist services to the oil and gas industry. BOSS plans to tap the capital market on April 25 with a public issue of 180 lakh equity shares of Rs 10 each at par aggregating Rs 18 crore. The issue is to part finance the company's project which involves contract drilling by way of charger hire of the rig, BOSS Prithvi to oil explorating agencies/companies in India and/or abroad. The rig has undergone a comprehensive refurbishing at Dubai drydocks and will be placed on charter hire with oil and gas exploration companies' agencies in Indian waters by the end of 1994.

Pan India Drugs

Pan India Drugs and Chemicals commenced production of trimethoprim, norfloxacin and disclofenac sodium under phase I of its Rs 4.6 crore project in February this year. The company is now setting up production facilities for manufacturing 225 mtpa of ibuprofen under phase II of the project which is expected to be completed in this July. The company has already entered into an export tie-up with Panchsheel International, Bombay, for 100 per cent of its production under phase I and 150 mt of ibuprofen under phase II. Further, it has export orders worth $ 90,750 for 4,000 kgs of trimethoprim and disclofenac. To part finance the project the company plans to tap the capital market on April 18 with a public issue of equity shares of Rs 10 each at par aggregating Rs 2.8 crore.

The annual rise in WPI has almost touched double-digits and much of the increase has been in basic consumption goods and non-food primary articles. A majority of the infrastructure industries have shown some growth over the fiscal year, except hydel power, cement and fertiliser. Base money has been swelling continuously due to the RBI's market intervention in buying foreign exchange. The trade weighted exchange rate of the rupee has risen over the previous year, particularly in real terms. There was a substantial decline in tourist arrivals in 1993-94. There was also a reduction in net aid inflow. Foreign exchange reserves have crossed the $ 15 billion mark.

PRAKASH INDUSTRIES

Diversification into Steel

THE first picture tube company in the country to get ISO 9002 recognition, Prakash Industries (PI) which declared a 1:2 bonus issue last year, has further improved over its performance in 1992-93. A multi product multi-divisional company, PI manufactures rigid pvc pipes profiles, fittings and moulded fittings, black and white TV picture tubes, magnetic tapes for video cassettes, blank video cassettes and glass shell for black and white TV picture tubes but draws a major part of its income from the former three items.

For the year 1992 93 the company's net sales rose by 13 per cent and gross profit and net profit registered an increase of 12.6 per cent and 39 per cent respectively. The company's picture tube division showed marked improvement, producing 7,68,770 picture tubes (pts) as against 7,50,000 pts produced in the previous year. Sales rose from 7,47,041 pts to 7,69,185 pts while realisation and profitability improved considerably. The company's pvc pipe division in Madhya Pradesh is a major supplier of pvc pipes to government departments in north India. Though production and sale of pvc pipes improved to 14,596 mt (14,320 mt) and 14,640 mt (14,339 mt) respectively, sale realisation suffered with the division's turnover falling from Rs 51.8 crore to Rs 47.8 crore The video tape division saw a 100 per cent increase in export earnings while the company's total export earnings rose by 56.9 per cent over the previous year

The company's 1,50,000 tpa sponge iron plant in Madhya Pradesh was commissioned in November 1993 and is reportedly operating at over 120 per cent capacity utilisation within a short span of five months from the date of commissioning. The plant is based on SL/RN technology of Lurgi, Germany, and was implemented in a record 31 months. It has already achieved metallisation of over 92 per cent as compared to an industry average of about 86-88 per cent. The company has also embarked on a diversification project for manufacture of rolled steel products and an iron-ore mining project. The company's power co-generation plant which converts hot gases emanating from the sponge iron kiln and generates up to 10 MW of power will also partly cater to the proposed steel plant in addition to meeting the entire power requirements of the sponge iron plant. The power co-generation plant is the first of its kind in the country and has been designed by Lurgi. It has started generation of power. The proposed steel plant at the sponge iron site will produce rolled steel products like structurals, joists, channels, angles and alloy constructional steel of various sizes and grades which will find application in power plants, dams and bridges, transportation, heavy industrial projects and seamless pipes manufacturing units. With the commissioning of the diversification project the company's sponge iron plant will be the first integrated steel complex through the sponge iron route in the country

The company's pvc pipe division has secured deemed export orders for supply of pvc pipes to World Bank aided projects of West Bengal and Bihar governments and the division has also commissioned one unit for manufacturing rigid pvc pipes to cater to the vast demand for pvc pipe in Punjab and Haryana.

For the first half of 1993-94 the company has further improved its performance. Net sales rose from Rs 65.8 crore in the corresponding period last year to Rs 68.6 crore and net profit rose from Rs 4.8 crore to Rs 5.1 crore.

GUJARAT STEEL TUBES

Victim of Recession

The drastic reduction in the government's purchases coupled with the other anti-inflationary measures led to severe recessionary trends in the domestic market. With the sharp fall in selling prices in the second half of 1992-93 following acute slackness in demand, Gujarat Steel Tubes (GST) suffered a net loss for the third year in succession. The adverse conditions prevailing were aptly reflected in the fact that SAIL for the first time offered clean credit to its buyers. This was necessary as the market could not absorb the 25 per cent higher prices of HR coils and CR coils with the result that GST's margins came under severe pressure. Further the recession in the automobile industry affected the output of the precision tube division with production of welded black, galvanised and precision steel pipes and tubes falling from 68,588 mt in 1991-92 to 67,213 mt. Sales were also lower at 54,119 mt (59,802 mt) of pipes/tubes and 8,356 mt (8,087 mt) of precision tubes and despatches were badly affected by the disturbances in Gujarat and Maharashtra in December 1992 and January 1993.

For 1992-93 the company's total income increased by 12.4 per cent, but a sharp rise in operating expenses led to a drastic fall of 81.2 per cent in operating profit. A 14.5 per cent rise in interest charges (despite a fall in total term loans) added to the company's woes and net profit fell by a phenomenal 245.7 per cent over the previous year. A 12 per cent rise in the GST's exports and a 20 per cent rise in FOB value of exports acted as a silver lining with the company restarting exports to Kuwait and also entering a new market, namely, Zambia. GST received the EEPC All-India Award for Export Excellence for the year 1991-92.

With the government refunding the balance of excess customs duty of Rs 2 crore, the company has received the entire refund of Rs 6.1 crore. The continuing liberalisation on the economic front has resulted in easy availability of the company's main raw material, HR coils and CR coils. With this the company will be able to better utilise its capacity. During the year under review the company revalued its land at villages Kali and Chenpur and the net surplus of Rs 7.2 crore was credited to revaluation reserves.

For the first six months of 1993-94 the company suffered a net loss of Rs 3.6 crore on a net sale of Rs 61.5 crore.

SURAJ VANASPATI

Lower Profit

Keen competition in the market and consequent sharp fall in selling prices led to a fall in the profitability of Suraj Vanaspati, a UP-based company, in 1992-93. The company's gross profit fell by 18.5 per cent and net profit fell by 37.9 per cent over 1991-92. Despite an increase in production and sale of vanaspati from 30,332 mt and 30,858 mt in 1991-92 to 36,593 mt and 36,258 mt in 1992-93, respectively, sale realisation fell drastically leading to severe pressure on margins. A more than proportionate increase in operating expenses and a sharp rise in tax provision also contributed to the fall in net profit. The company achieved a capacity utilisation of 111 per cent on an installed capacity of 33,000 mtpa. However, net value added fell 21.4 per cent with the proportion of net value added to value of production falling from 6.2 per cent last year to 4.6 per cent. Despite the fall in profit the company raised the dividend rate from last year's maiden 12 per cent to 20 per cent.

Launched last year, the company's expansion plan will increase the plant production capacity by 50 per cent from the existing 33,000 mt. Commercial production was expected to commence in 1993-94. The company has also invested Rs 1 crore in a new company, namely, Suraj Industries, which is being set up in the assisted sector with HPSIDC. The new company is setting up a vanaspati and refined oil manufacturing unit in Himachal Pradesh.

With excess capacity and poor realisations putting pressure on the vanaspati industry's margins, the company has performed poorly in the first half of the current year. Net sales fell from Rs 65.9 crore in the corresponding period last year to Rs 55.4 crore and net profit fell from Rs 1.3 crore to Rs 0.7 crore.

ORISSA SYNTHETICS

Reconstruction Scheme

Orissa Synthetics, a sick company belonging to the B H Singhania group, slumped deeper into the red with a net loss of Rs 25 crore during the year ended March 1993. Referred to the Board for Industrial and Financial Reconstruction (BIFR) for rehabilitation, the company is being merged with its parent company, Straw Products, as per the proposals of its operating agency, IDBI. The merger, which will be with retrospective effect from February 1, 1992, will enable the company to turn around and restructure its liabilities through reliefs, concessions and exemptions provided by financial institutions, banks and the Orissa government. The BIFR order has also provided tax reliefs to the company under Section 72A of the Income Tax Act, 1961.

During 1992-93, the company's net sales increased by 57 per cent in spite of severe competition in the PSF market. The increase in turnover is attributable mainly to full utilisation of its new polyester filament yarn (PFY) plant and higher capacity utilisation of the polyester staple fibre (PSF) unit. Since production of PSF increased to 10,201 MT during the year from 8,428 MT, the company was able to increase its demand exports and offset the setback to direct exports because of imposition of anti-dumping duties in European markets and general international recession. Overall, exports declined by 69.4 per cent.

With the budget for 1994-95 having accorded sops to the man-made fibre industry and reduced the duties on PSF as well as its raw materials, the company should be able to do well in the coming years. Moreover, the merger with Straw Products envisages that the latter, besides altering the product mix, would provide additional funds to meet Orissa Synthetics' requirements for deferred capital expenditure, upgradation of existing facilities and addition of high value products.

To consolidate its presence in the market, the company, through research and development efforts, has developed new value added products, improved product quality and is trying to optimise process parameters to achieve overall optimisation of production. The company spent 0.6 per cent of its turnover on R and D during the year.

For the first half of 1993-94, the company has posted a net loss of Rs 12.2 crore on sales of Rs 91.3 crore.

PRIYADARSHINI CEMENT

Rise in Costs

A Hyderabad-based company, Priyadarshini Cement has not been able to post a commensurate increase in profitability along with its turnover in 1992-93. Though operating and gross profits improved by 0.3 and 5 per cent, respectively, on a 11 per cent increase in net sales, profit after tax declined by 42.5 per cent.

The company has attributed the decline in net profit to increase in coal costs, power tariffs and the royalty payable on limestone. Further, sluggish market conditions due to lack of demand from state and central governments resulted in stagnant sales realisation and affected margins. Thus, while the gross profit to net sales ratio improved, net profit margin halved and the return on equity deteriorated further. The company's inventories to sales ratio also moved up. However, remuneration to employees as a percentage of both gross value added and value of production improved. Because of accumulated losses of the previous years, the company has yet again missed the dividend list.

During the year, the company achieved a capacity utilisation of 119 per cent, the highest achieved by it thus far. As a result, production of cement increased by five per cent from 6,80,706 mt to 7,14,432 mt. The company's manufacturing process is based on know-how from Onoda Engineering Consulting Company, Japan.

For the fist six months of 1993-94, Priyadarshini Cement has posted a marginal net loss of Rs 0.3 crore on net sales of Rs 43.8 crore.

Industrial Sickness and Corporate Restructuring

Bagaram Tulpule

Sweeping generalisations, such as offered by the Committee on Industrial Sickness and Corporate Restructuring, do not help in correct diagnosis and treatment of the malaise of industrial sickness.

WHAT the report of the Onkar Goswami Committee on Industrial Sickness and Corporate Restructuring says is just what the finance ministry must have liked to hear. Nor would this be a coincidence. In the preface to the report, the committee tells us how it came to be constituted. A group of economists and lawyers was invited to make a presentation on various aspects of industrial sickness and corporate restructuring 'for the benefit of the finance minister'. After the presentation, the minister requested the same group to constitute itself into a committee. Thus, the views of the committee were already known to the ministry and the committee took no more than three months to give them the formal shape of a report. Besides, three of the seven members of the committee including the chairman were associated with a project on industrial sickness initiated by Rakesh Mohan of the finance ministry over two years earlier. Thus, the committee's report and recommendations could not contain much that was not already known to the ministry. Perhaps it was felt in the ministry that calling the group a 'Committee' would give greater weight to its views!

Unlike usual practice, the report does not include the terms of reference given to the committee by the ministry. Perhaps formal terms of reference were not deemed necessary the way the committee came to be constituted.

The committee sets out its credo almost at the beginning of the introduction itself and it deserves to be reproduced at some length: "The prospects of industrial growth and investment depend upon the signals that India gives to the rest of the world as well as to her own entrepreneurs. The reforms initiated in July 1991 have already started sending positive signals. People realise that there has been a serious attempt at macro-economic management, reducing the fiscal deficit, cutting unwarranted subsidies, reorienting the import regime away from quotas to tariffs, introducing floating exchange rates on trade account, eliminating a number of hitherto sacred barriers to entry and at restructuring the fiscal system to gradually bring import duties in line with competing developing nations." Further, "It requires giving signals to potential entrepreneurs... about the scope of operational flexibility--in the choice of output, of markets and in the use of labour and capital... and reutilising the land and labour thus freed in the best possible manner." The various barriers to restructuring, the committee unanimously holds, "...serve no economic goal, choke off future growth opportunities and foster an uncompetitive environment which rapidly leads to gross and pervasive industrial sickness... These barriers are anti-labour... result in a systematic drain on scarce public funds... barriers to restructuring have only one overriding purpose: they maintain an army of inefficient promoters and managers... who justify their incompetent existence on the ground that their firms 'protect' employment." This credo is clearly on the same wave-length as the thinking of the present economic policy-makers and is stated in a forceful and sweeping style

The committee has discussed at length the extent of sickness in the private and public sectors and presented an analysis of the financial aspect of sickness highlighting the unsustainably high fixed costs, especially interest and labour costs of sick units. It has also dealt exhaustively with the working of the Sick Industrial Companies (Special Provisions) Act,1985 (SICA) and with the powers and procedures of the Board of Industrial and Financial Reconstruction (BIFR) set up under the act. In the committee's opinion, the present definition of a 'sick' unit results in sickness being identified too late and hence rehabilitation being much more difficult. In fact, the committee takes the view that rehabilitation is not the primary role of SICA and BIFR and wants that words closely associated with rehabilitation—'preventive', 'ameliorative' and 'remedial'—should be omitted from SICA. "We shall not proceed very far in industrial restructuring unless we radically alter the form, content and scope of SICA", the committee asserts (paras 3.4.9 and 3.4.10) and presents an alternative draft of SICA. The committee is strongly critical of the exceedingly slow working and procedures of the BIFR. Few will disagree with this last criticism.

'Barriers to restructuring' come up again and again in the report and the committee clearly regards these as the principal culprits both in "rapidly leading to gross and pervasive sickness" and in thwarting restructuring of viable units and withdrawal (the word 'exit' is scrupulously avoided) of the non viable ones Techno-commercial and managerial factors which are the real causes of industrial sickness are hardly discussed anywhere in the report which focuses almost exclusively on the financial aspects of the malaise which really are not the cause but the consequences of techno-commercial and managerial failures.

According to figures given by the committee, the number of large and medium sick firms in the year 1989 was 2,269 and the bank credit locked up in them was Rs 6,926 crore. While it talks of 'pervasive sickness', it has not placed the above figures in the context of the total number of large and medium firms in the country and the total bank credit outstanding in them. According to ASI data for the relevant year, the number of factories employing capital of over Rs 35 lakh was 10,750. If non manufacturing large and medium firms are added to this figure the proportion of sick firms to the total may be of the order of 20 per cent. Similarly, assuming that a bank credit limit of Rs 10 lakh and more would apply to large and medium firms, the total outstanding bank credit to such firms in June 1989 was Rs 44,299 crore. Thus outstanding bank credit in sick large and medium industries at that time was about 15.6 per cent of the total credit outstanding in all such firms.

These percentages of number of sick units and outstanding bank credits in large and medium segment are, no doubt, large. The question, however, is: do these percentages indicate 'pervasive' industrial sickness resulting from the very system which places 'barriers' in the way of restructuring? A related question is, if there were no so-called barriers to restructuring or where they do not exist, do no industrial units go sick and is the proportion of such sick units significantly lower? Even where sick units are allowed to die out, or withdraw, which is the preferred term, how much of the outstanding bank credit, the 'scarce public funds', are recovered from them?

This is not to trivialise the problem of industrial sickness but to caution against losing perspective and a sense of proportion. Sweeping generalisations do not help in proper diagnosis and treatment of the malaise of industrial sickness.

The committee, as mentioned above, makes no effort whatever to go into the real causes of industrial sickness which are mostly techno-commercial and managerial and sometimes government trade and tariff policies. Financial troubles like high fixed costs, continuing cash losses, high debt-equity ratio, negative net worth and default in payment of bank and labour dues are consequences and indications but not the causes of sickness. The recommendations of the committee which relate exclusively to the financial factors, therefore, cannot forestall sickness. Even if all the precautions recommended are taken by the banks and financing institutions, if the real causes of sickness persist, sickness will not be pre-empted; only timely 'withdrawal' of firms will be achieved.

Understandably, the most important remedy in tackling sickness which recurs frequently in the report is speedy winding up of a non-viable unit, sale of its assets, mainly land and paying off secured creditors and labour to the extent possible. The committee does talk about 'reutilising' the labour 'thus freed' (read 'thrown out of jobs') in the best possible manner. It cannot be unaware that in the present environment and government policies, vacancies for productive reutilising of displaced workers just do not come up. So, 'carefully computed drafts' on the so called National Renewal Fund (NRF) are all the relief that the displaced workers can look forward to.

As mentioned above, barriers are viewed by the committee both as factors leading to pervasive sickness and as thwarting remedial action. There is a whole chapter in the report titled 'Barriers to Restructuring'. Section 5.1 of this chapter is titled 'What Are Barriers to Restructuring'. This section has three paras but one reads them in vain so far as discovering what barriers the committee has in mind. Further on, the chapter does deal with difficulties in securing change of erring management, selling excess land, converting debt to equity, amalgamations and, of course, winding up. But all these come up after a unit has gone sick, not before. What the barriers are that cause a unit to go sick in the first place is nowhere clearly brought out. Faulty project appraisal and failure to detect tainted accounts in time by banks, amounting debt-equity ratios and net worth turning negative, generally failure of banks to detect incipient sickness in time, which the committee speaks of, can hardly be called barriers to restructuring. They are simply failures of banks and managements to properly discharge their normal functions. There is nothing in the prevailing system that stands in the way of their performing their functions properly, no barriers in the proper sense of the term.

Provisions of the present SICA prevail over those of all other laws with the exception of the Urban Land (Ceiling and Regulation) Act and the FERA. The committee is strongly against SICA not prevailing over FERA and concludes that this is due to what it calls the 'archaic fear' of foreigners taking over our national industries. As if archaic was not a strong enough epithet, it calls the fear 'xenophobia'. Actually, it is doubtful if there is anything in SICA which precludes a FERA company from making a bid for taking over a sick unit. Besides, with a number of large and reputed companies and products already going under the control of foreign companies and MNCs, the fear about foreigners taking over our national industries can hardly be described as archaic, it is very contemporary and real.

The committee insists that there should be no mandatory obligation on the firm itself to go to BIFR when it becomes sick, that is, when it makes cash losses for two consecutive years and its net worth turns negative. Besides, the committee wants the criterion of sickness to be default for 180 days in the payment of dues to secured creditors. The obligation of formulating a rehabilitation scheme should, according to the committee, be on the sick firm and not on the banks or the state. Finally, the committee recommends that if the firm, given two chances over a period of 120 days, is unable to produce a scheme to the satisfaction of the secured creditors, it should be deemed non-viable, be speedily wound up, its assets sold and the proceeds handed over to the appropriate high court for distribution among creditors. If a scheme satisfactory to the creditors is put forward by the firm, the BIFR has merely to endorse it. Thus, under the committee's alternative proposals the BIFR is left with only two functions: sanction an agreed scheme or wind up the firm. In neither function does the BIFR have any judgment to exercise.

In fact, the committee's proposals taken together will have the effect of rendering both SICA and BIFR superfluous. If a firm has the will and the capability to produce a scheme acceptable to the creditors, would the firm not use that will and capability to prevent itself from going sick in the first place? And even if such a scheme is framed after the firm goes sick, if the scheme is acceptable to the creditors, what is there to prevent the firm and the creditors from implementing the scheme without going to the BIFR at all? For, according to the committee, the firm should have no obligation to go to the BIFR. Indeed, the committee is fully aware of this possible result of its proposal. It observes, in para 3.4.11 that "it will give freedom to the firm and the secured creditors to work out a reorganisation package outside of BIFR if they so choose..."

Having thus rendered SICA and BIFR *functus officio* one wonders why the committee goes to the trouble of proposing an elaborate alternative draft for SICA. If winding up a firm when a scheme acceptable to the creditors is not put forward by the firm is the only job left to BIFR, that job could as well be entrusted to the existing judiciary with appropriate amendments to the existing law to make winding up easier and speedier.

The committee lays great emphasis on the need for reform of the financial sector. It also insists that in any reorganisation package, the projections of future sales should not be over-optimistic, that future cash flows should be calculated using market rates of interest for discounting, that the opportunity cost of further commitment of funds to revive the firm should be taken into account, that the concept of 'sacrifices' by the parties concerned should be done away with in formulating rehabilitation schemes, that past debts should not be written off but converted into equity and so on. The committee also discusses at length how sale of land belonging to sick firms, especially sick textile mills and engineering companies, offers a highly fruitful device for both rehabilitating viable sick units and paying maximum shares of their dues to labour and secured creditors in the shortest possible time in the case of non-viable units.

One serious implication of the recommendations of the committee needs to be taken special note of. Since drawing up of rehabilitation schemes is sought to be made the concern of the sick firm itself subject to acceptance by the secured creditors, the possibility of employees taking over a sick firm and running it through their co-operatives is effectively ruled out. It has become clear in any number of cases that existing private owners of firms are strongly resistant to any proposals for take-over by workers' co-operatives. They would rather let their firms die out than let them be taken over by workers. If the possibility of easy sale of their land is opened up before them, their resistance to workers' take-over will harden. Even otherwise, the firm and the creditors acting together will hardly ever countenance workers' take-over as an acceptable mode of restructuring a sick firm, even an apparently terminally sick one.

It is perhaps ironical that the enthusiastic recommendations of the committee may remain in the limbo eventually. The most recent pronouncements of the policy-makers show a distinctly reduced enthusiasm for implementing any drastic exit policy by whatever name called. They also show somewhat greater concern for the deteriorating employment scenario in organised industry. Such a change of stance, possibly a sign of the 'middle path' mooted by the prime minister, if genuine and not merely calculated to confuse, can hardly accommodate the drastic remedies recommended by the committee.

Communal Violence and Role of Police

Asghar Ali Engineer

The police together with other law enforcement machinery, such as the local administration and judiciary, play a crucial role in communal riots. Greater attention needs to be paid to their training and education so that they may act impartially, following the law of the land.

THE role of the police in communal riots has always been a highly controversial issue. Riot victims generally complain that: (1) The police did not come to their rescue; (2) police forces were themselves instrumental in the killing; (3) they led the mob in looting and burning; (4) arrested innocent persons and tortured them inside the lock-up and put false charges against the arrested persons, and (5) encouraged the culprits to do whatever they liked by preventing the members of one community to come out during the curfew and allowing members of another community to do so with impunity. These and some other grave charges are made against the police after every communal riot. During the Bombay riots in December 1992 and January 1993, serious allegations were made against police officials, high and low. Here we examine a few cases of major communal riots after independence and throw some light on the role of the police during these riots.

It should be borne in mind that the entire law and order machinery cannot be and should not be damned. By the entire law and order machinery I mean all those who are involved in restoring peace which include the political leaders, bureaucracy and administrative machinery and various organs of those who actually restore order in the field, ie, the local police, the Border Security Force (BSF), the Central Reserve Police Force (CRPF), and the army. The politicians, the administrative machinery, the police and the CRPF, army, etc, play different roles either at the same time or in different phases. It is, therefore, more informative and useful to examine the role of the entire law and order machinery in communal riots. We will try to throw light in some detail on various organs of the law and order machinery in communal riots. We will try to throw light in some detail on various organs of the law and order machinery during a riot. It should be borne in mind that the most damned of all these is the police as it comes in direct contact with the victims and is the most visible part of it as far as general public is concerned and hence it is the police which is condemned most by the people. Before we proceed with the discussion of the role of the law and order machinery in controlling a riot, it would be useful to discuss some general aspects of riot engineering.

A riot is generally supposed to be a spontaneous outburst of violence between the two communities. However, it is rarely so. In pre-independence period some major riots belonged to this category. Most of the riots then and almost all the riots now are meticulously planned and executed. It is necessary to make this distinction as the role of the law and order machinery depends very much on whether the riot is planned or is a spontaneous outburst. If it is spontaneous, it is easier to control but if it is well-planned, it assumes a different character and requires more motivation and determination on the part of the police to control it.

As pointed out earlier most of the riots today are pre- planned. This planning is done usually by some political party or the other or even by some anti-social elements these days either to serve their own interests or those of their political patrons. When a riot is pre-planned, an 'appropriate atmosphere' needs to be created and this is often done with a view to raising the communal temperature by spreading some atrocious rumour. This greatly helps in spreading communal violence and also in justifying it. In other words, the violence acquires legitimacy in the eyes of people of the community which is aggressing against the other. In such a situation it is much more difficult to control violence as it acquires legitimacy and has thus motivated the people. And this much more so when the issue involved is religious or historical deeply embedded in the people's emotions. In such cases even those people get involved in violence who otherwise have no previous criminal record as violence appears quite justified to them *vis-a-vis* the other community. Thus a study of the Bhivandi riots of 1970 by a high police official Suresh Khopade clearly shows that more than 70 per cent of the people involved in committing violence were those who had no previous communal record. The apparent issue involved in these riots was the celebration of the birthday of Shivaji and the route of the procession which is highly emotive. In such a case it becomes more difficult to control the situation as it also creates political problems apart from law and order problem.

More often than not, riots are planned to serve a political purpose and hence a political party is invariably involved. At times two political parties or one of the sections of (ruling) party in collusion with the other party engineer communal violence for their own political purposes. The role of the administration and the police in such cases becomes much more complex and even difficult. The police officials cannot normally ignore the instructions from their ruling political bosses. It is not always true that the police has a free hand to deal with a situation. It has to face several constraints if the political bosses themselves do not have clean hand. In this respect I would like to cite the example of 1984 Bombay-Bhivandi riots. It is alleged that these riots started with a subtle understanding between the Shiv Sena chief Bal Thackeray and the then chief minister Vasant Dada Patil. Patil was facing a severe problem from the Congress dissidents and was finding it difficult to get his candidates elected to the Rajya Sabha without the help of the Shiv Sena MLAs. Bal Thackeray, on the other hand, was creating the Hindutva platform to revive his sinking fortunes. Thus the Vasant Dada Patil group and the Shiv Sena allegedly came together to serve their own respective political ends. The Sena created 'appropriate atmosphere' for the riots and the riot broke out in May 1984 in Bhivandi and soon spread to various parts of Bombay. Rebeiro was the police commissioner who was known for his integrity and efficiency. Yet the riots could not be controlled easily as his hands were not free. The Shiv Sainiks were roaming around freely wielding swords killing and threatening members of the minority community. The shakha 'pramukhs' were not touched. But when the riots were likely to break out again, in the second phase on *Jumat-ul-wada*, ie, the last Friday of the holy month of Ramadan, it became embarrassing for the chief minister and he allowed free hand to Rebeiro to handle the situation. Rebeiro ordered the immediate arrest of those shakha pramukhs in whose jurisdiction communal violence was likely to break out and he also sent out a circular to all the police stations in Bombay city that the inspector in whose jurisdiction communal violence breaks out will be suspended. Nothing happened due to these stringent measures and the city remained quiet on that fateful day. The police can act much better if there is political will.

Political Pressure

Thus politicians, administrators and the police all play their roles in the event of an outbreak of communal violence. If the ruling politicians are determined to prevent violence, the administrative and the police machinery can act with much greater determination and efficiency. We can also give here the example of the West Bengal government. The Left Front government in West Bengal is least interested in having communal trouble. It has thus issued strict instructions to the police authorities not to allow the outbreak of communal violence and, in the event of its break out in exceptional circumstances, to control it with speed and determination. Any laxity will be severely punished. A high police official of the government of Bengal told me about this circular. Not only this, the Left parties in West Bengal continue to work to counter communal propaganda and hold rallies to promote communal harmony if there is any danger of outbreak of communal violence. No wonder than that when Bombay was burning in December 1992, violence in Calcutta could be brought under control much more speedily. Chief minister Jyoti Basu personally supervised the operations. Similarly when communal violence broke out in Sitamarhi in early 1992, Laloo Prasad Yadav immediately reached the town and took command and brought the situation under control, though many lives were lost by then. Had Laloo Prasad Yadav not taken the control, much more damage would have been inflicted.

Contrast this with other similar situations in other places. The 1987 riot in Meerut, for example. Not only that did the police miserably fail in controlling the riots but the PAC pulled out 34 young Muslims from their houses in Hashimpura, loaded them on a truck, drove off to a canal, shot them dead and threw their bodies into it. The then chief minister of UP Bir Bahadur Singh came to Meerut and stayed there for two days, May 20 and 21 and yet showed no determination to control the riots. On the other hand the rioting intensified during those two fateful days and the Hashimpura incident occurred just one day after he left Meerut. Some people even alleged that it was done at the instance of Bir Bahadur Singh. However, no clear proof can be given for such allegations.

Again the then Bihar chief minister Dube showed no political will to control the riots in Bhagalpur which wrought absolute havoc. Around a thousand lives were lost. The police openly colluded with the culprits. Similarly when Bombay was burning in December 1992 and January 1993 Sudhakar Nayak, the then chief minister gave an impression of total helplessness. The police shot down about 200 people and colluded with the Sena during the January phase. Many more such examples can be given which clearly show that political will is as necessary to control communal violence as the administrative efficiency and the police determination. Without political backing both the administrative machinery and the police will collapse and riots will inflict much greater damage in terms of life and property. During the Bombay riots of December 1992-January 1993 had Nayak shown determination as Jyoti Basu of West Bengal did, Bombay would not have suffered such unprecedented agony.

Role of Other Law Enforcement Agencies

We have to take into account the role of the different organs of the law enforcement machinery as well the role of police. We have already discussed the role of political leadership, particularly of the ruling political leadership. We must also throw some light on the role of the bureaucracy. The district magistrate can also play a very crucial role in controlling the riots. In fact it requires a team spirit between the DM and the SP. But the DM certainly has an upper hand. It has been observed by me while investigating various communal riots that the DM plays a very crucial role but one rarely comes across a DM who shows courage and acts independently. More often than not, he looks up to his political bosses and acts according to their will rather than according to well laid down rules and regulations for such situations or according to his constitutional duty. And if he does, he is transferred in no time.

It needs no elaboration that most of the bureaucrats look up to the chief ministers for their plum posting and no DM normally would like to displease his/her political boss. This was brought out during interviews with some of the DMs. The DM of the Sitamarhi district was accused of laxity by many people in Sitamarhi. If he had reached the site of communal riot in time much damage could have been prevented. But he remained indifferent to the apprehension of breaking out of communal violence. The SP was even accused of being patron of one of the *'akharas'* of Sitamarhi which played active role in provoking communal violence. Similarly the role of DM Kashyap in the Meerut riots of 1987 was far from satisfactory. Most of the victims complained that he did not take effective steps to control the riots. There was, on the other hand, no such complaint against the district magistrate of Bhagalpur when the riots broke out there in October 1989. It has also been observed quite often that if the DM is honest and efficient and wants to control the riots effectively, the communal elements in the town put pressure on the home minister or the chief minister and get him transferred. Thus even a non-communal officer sometimes finds himself in a deep water.

One must also take into account the role of the intelligence agencies. Often I have heard people say during investigation of riots that the intelligence agencies did not gather their intelligence properly and hence proper action could not be taken

in time. This is so in many cases but not in all. When we contact the intelligence agencies we hear a different tale. Often they too complain that they had done their best and the information that trouble is likely to break-out was passed on to the appropriate authorities. However, no action was taken in time. For example, in case of the Bhagalpur riots, the intelligence agencies had played their role properly. However, the administration did not act on the information. It was so in case of the Sitamarhi riots also. The administration was found to be slack. This was found to be so in case of the Bhivandi riots of 1970. The Madan Commission Report has also commented on it.

It is also true that intelligence gathering is no easy job. Information is difficult to come by. It requires highly efficient and motivated staff. But the intelligence department hardly has such a staff. In fact it is well known that the staff not required elsewhere is posted in the intelligence department. It is often suggested that most competent persons be posted for the intelligence gathering but no one takes such suggestions with the seriousness it deserves with the result that proper intelligence is not forthcoming on such occasions. There is another factor also which must be taken into account. Like the administrators, policemen, and others the intelligence people also have their own perceptions which affect the intelligence gathering. As Muslims are often seen as aggressors, intelligence people feel that it is Muslims who are preparing for the riots. Their defensive preparations are seen as aggressive preparations and the majority community's aggressive preparations are seen as defensive ones. Here we are not suggesting that the minority community does not ever take aggressive postures. On many an occasion it does. We are only talking about the perceptions of the intelligence gathers here. The intelligence officers need to be given proper reorientation training to make intelligence gathering a more reliable operation.

Apart from the local police, we have PAC, SRP, CRPF, BSF and the army. The local police and the SRP and the PAC in UP and the BMP in Bihar has acquired notoriety in the eyes of minorities. In most riots, the PAC and BMP have behaved violently and even killed many innocent people. The case of Meerut riots of 1987 is most notorious. As pointed out before, the PAC constables under the command of Tripathi, pulled out 34 young boys from Hashimpura and shot them dead by the side of a canal. Also, on May 23 they shot dead about 67 Muslims coming out of the mosque after the Friday prayer in a village called Malyana six km from Meerut city. No one was punished for this heinous crime. Tripathi was temporarily suspended but reinstated soon thereafter. I have not found any satisfactory answer to this so far as to why Tripathi shot so many innocent people dead and yet got away with it. In Los Angeles one black man was beaten up by a white policeman and there was hue and cry and Los Angeles was rocked with violence. The guilty police official was arrested and when the jury set him free there were protests and he was tried again and held guilty. Such a thing is unthinkable in India. Scores of people are killed in riots, most of whom happen to be innocent and yet no action is taken against the guilty officers. This is a grim tragedy. In the 1982 Meerut riots almost several innocent persons were shot dead by the PAC. One Shabbir's only son was shot dead before his eyes and again at gun point he was made to load his son's body on the police van. Later on his dispensary was ransacked completely and all bottles of medicine were broken to pieces. The eminent jurist Justice Krishna Iyer was so shocked by these brutal incidents that he wrote an angry letter to the then prime minister Indira Gandhi denouncing these incidents and demanding strong action against the culprits. But nothing came out of that. Similarly in the Moradabad riot of 1980 the PAC fired ruthlessly on the innocent people in the Idgah maidan and hundreds fell dead. No police officer was punished for these deadly crimes. Such a callous attitude naturally emboldens the PAC to act more ruthlessly in later riots.

The record of BMP is equally notorious. In the Bhagalpur riots of 1989 its record was much more shameful than that of the PAC. It became a marauding force. In one case about a hundred people took refuge in a house in a village called Chanderi near Bhagalpur. The army gave them protection but as Major Wirk who had taken charge of the house had to go elsewhere, he asked the BMP men to take charge and protect the helpless people inside. The BMP, however, brought these people out on assurance of safe conduct to their homes and allowed them to be butchered by the goons. And all this was done with the full backing of the police. All major newspapers had reported this incident at that time. The whole incident would have gone unnoticed but for alertness of Major Wirk. He saw a human leg jutting out of the lake. He pulled out the body to discover to his horror that it was of a woman who was assaulted and her body was thrown out into the lake thinking she was dead. Fortunately she was alive and she told the whole story. Similarly in Logain village entire Muslim population of more than 100 souls was wiped out and buried in a field over which cabbage were grown. Around 1,000 persons perished in Bhagalpur riots. In Bhagalpur town also the police was openly on the side of the miscreants.

In the Baroda riots of 1983 the role of the police was far from desirable. One of the police officials was allegedly being bribed by Shiva Kahai, one of the main culprits in those riots along with some Muslim bootleggers. This police official had allegedly constructed for himself a posh bungalow which was not possible for his salary. He openly sided with Shiva Kahar in the riots and lot of innocent Muslims lost their lives and suffered loss of property. In all subsequent riots in Baroda the role of the police has been no better—peaceful communities like the Bohras, Khojas and Memons have suffered greatly.

Ahmedabad has become the most sensitive place as far as communal violence is concerned. The largest and most catastrophic communal riot after independence was in Ahmedabad in 1969. This riot had shaken the entire country. More than 1,000 persons had perished in this riot. The loss of property was even more staggering. To the best of my knowledge it was for the first time that electoral rolls were systematically used in this riot to mark the Muslim houses and voters. Such a staggering loss of lives and properties would not have occurred without the connivance of the police force. The then government of Gujarat had appointed the Justice Jaganmohan Reddy Commission to inquire into the causes of communal violence. *The Reddy Commission Report* while commenting on the police role says:

> We have already mentioned in another Chapter suggestions made in cross-examinations against Hindu officers that because they were Hindus, they showed anti-Muslim attitude; to officers other than Hindus or Muslims the suggestions were that because they wanted to please the government, they showed anti-Muslim attitude. It is, in our view, not unnatural for the Muslim community which has suffered a great loss in life and property in the riots and felt helpless in most cases in not obtaining relief and protection in time, to view the matter, with a sense of suspicion, grievance and frustration and feel that everything that could have been done had not been done because the officers and men, majority of whom were Hindus were partial. Similarly it was suggested to Muslims officers, particularly to Ismail A Shaikh by the *Hullad Pidit Sahayta Samiti* that he was partial to Muslims by trying to cover up cases and in which Muslims were involved either by not disclosing that fact or by showing that Hindus were involved. To what extent there is justification in these allegations must be examined because if the feeling in the minority community is justified, the government and the police force has failed in their most fundamental duty to afford protection to its citizens to whichever community they may belong as is expected

from a civilised government and a well disciplined force.

Further on the report goes on to say,

> If, however, there is no justification for these allegations and suggestions, it is equally essential that it should be stated in no uncertain terms in order to assure the citizens at large particularly the minorities and give confidence to the police force. (See *The Reddy Commission Report*, p 191).

The report also says,

> We find it also necessary to advert to another allegation of the Muslim organisations that a great number of Muslim religious places which were near the police chowkeys and police stations were damaged by communal-minded police officers and men. It is true that these places which were near the police stations and chowkeys were damaged as pointed out in Chapter XV on the 'Toll of Disturbances'. The explanation given by police officers was that at that time there may not be sufficient policemen at the chowkeys and police stations or they may be engaged elsewhere but there is no satisfactory explanation of this nor is there any evidence contrary that this was allowed to be done deliberately. We have, however, an impression that though the whole of the police force may not be communally involved, there may be some instances where the police were affected by the Jagannath temple incidence. We have elsewhere in the chapter on 'communal atmosphere' occasion to point out that the communal virus is such that it is likely to affect even policemen who are not apart from society which is so affected though in our view the training, the discipline and the traditions that they are protectors and preservers of public peace and tranquillity should keep them free from such inhibitions. It is therefore in the larger interest of the police force itself and the confidence that the force must inspire in all sections of the community, that an inquiry by some competent officer of the rank of not less than a secretary to the government should be held and the report published to inspire that confidence.

In subsequent riots in Ahmedabad also we hear many cases of either indifference on the part of the policemen or dereliction of duty on their part. There also have been instances of direct collusion. We were told during our investigation of Ahmedabad riots of 1985 that in one of the labour areas of Ahmedabad a section of which is almost exclusively a Muslim area, a police inspector gave petrol from his motorcycle to set afire Muslim houses there. The officer concerned of course denied the charge. But the way houses were burnt in that part of the city there is no doubt that the police was indifferent and inefficient if not downright communal. During our investigation of these riots in Ahmedabad we heard from the victims number of stories in relation to the 'communal attitude' of the city police. However, there were no such complaints against the army by the Muslims.

Also there were bitter complaints against the police during the Bhivandi riots of 1970. The Madan Commission Report also passed severe stricture on the role of police in Bhivandi riots of that year. The commission even found that the police diaries were forged by the concerned police officers to involve one Ibrahim Maddu and others in the conspiracy to engineer riots. Maddu and others were later on exonerated by the court. It was also alleged by many Muslims that they were not only beaten up in police station but also police constables urinated in their mouth when they asked for water. The Bhivandi riots in 1970 had spread to Jalgaon also. There one Muslim lady alleged that her son was shot dead inside her house by a sub-inspector of the Jalgaon police. She went right up to Indira Gandhi with her complaint. However, nothing much seems to have come out of it. In Bhivandi riots of 1984 also we heard number of complaints against the alleged indifference in collusion or the excesses committed by the police. There also has been a general allegation that whenever curfew is declared it is imposed in one sided manner, ie, it is strictly imposed in the Muslim areas whereas it is quite lax in the Hindu areas and often we have also heard complaint during our investigations that the Hindu mobs are allowed to loot and commit arson during the curfew hours and when the Muslims come out to put out fire, they are fired upon. Such allegations were made by number of people during the Meerut riots of 1987. It was also alleged that the police in Meerut beat up 10 persons to death in police custody. Any number of such examples can be given to show that there has been a general complaint against the behaviour of the police by the members of the minority communities. It should also be mentioned here that the dalits have also made such allegations against the police. We investigated the caste riots in Ahmedabad in 1981. Most of the dalit victims alleged that the SRP and the police looted their houses and beat up their womenfolk. In 1985 too dalits were affected as for about a week; the riots had caste character. Many dalit houses were also burnt. Many dalits made similar allegations in 1985 also.

Bombay Riots

The December-January riots last year were a great disaster for the country. During these riots Muslims bitterly complained about the police role. In the first phase, ie, in December 1992, most of the Muslims were killed in police firing. In fact the post-mortem reports showed that out of about 250 deaths, 192 persons died in police firing and out of those more than 95 per cent people had sustained injuries above abdomen which shows that the police fired to kill and not to maim or injure. During our investigations in Govandi during December many women told us that their sons or husbands were dragged out of their respective houses and shot dead. The police, it appeared, had gone berserk. There were serious allegations against one inspector who, a police source admitted, should have been dismissed. The concerned deputy commissioner of police of that area transferred him after repeated complaints against him. However, it was too late and more than 50 lives were already lost by then. There were also allegations that some people were shot dead in their houses on first or second floor. For example, one young Muslim lady was hit on her neck near Underia Street off Maulana Shaukat Ali Road when she was in the balcony of her apartment on second floor. She died on the spot. Thus Justices H Suresh and S M Daud observe in their report *The People's Verdict*

> ...The police are also guilty of being partisan in these riots. Many witnesses have stated before us that they were attacked in the presence of the police and the police did nothing. In many cases, the police openly supported the rioters and accompanied them in the attack. When the victims went to the police station they were driven away without recording their com-

plaints. In some cases, the FIRs have been recorded but no further investigation has been undertaken. Several houses and shops were looted and the police could have prevented this or, in any case, have made no efforts to recover the looted articles.

The two retired judges of the Bombay High Court further observe,

What is regrettable is that in their frenzy to support a particular community, as against the other, the police had become indifferent to human misery. In particular, we would like to mention the cases of molestation of women and of rape and gang-rape... Still worse is the case of Ms F S ...from Sewri, where the police were themselves involved in gang-rape. The victim now has no faith in the police and in the administration of justice. (See *The People's Verdict*, pp 103-05.)

Both the justices also felt that the police did not prevent recurrence of riots after the December phase. It goes on to say,

After the first bout of riots in December, the police ought to have seen that the riots did not erupt again. The police and the government should have taken care to see that no tension was allowed to be built up. Instead, the police and the government gave permission to the Shiv Sena and the BJP to perform *Maha Aratis*. The evidence clearly indicates that *Maha Aratis* were one of the main causes for building up of tension leading to a riot, as happened in January 1993. In our view, permitting such *Maha Aratis* in different parts of the city during the said interregnum and thereafter, was a gross dereliction of duty on the part of the police. Whosoever had taken the decision to grant such permission should be answerable to the people of Bombay (p 105).

It has been seen during investigation of riots that the role of paramilitary forces like the BSF, CRPF, etc, and the army is such that often the minorities plead for retention of these forces in order to better protect their lives. During investigation of Bhivandi riots in 1984 many Muslim ladies desperately pleaded with me to use my influence with the authorities to retain the army at least for a month. They said that but for army they would have suffered much greater losses in terms of life and property. Not only this, in Ahmedabad riots of 1985 too, many persons told us that the role of army was commendable. This clearly indicates that the victims and their relatives and friends do not approve of the role of the local police and the armed constabulary like the SRP, PAC and BMP. It is important to probe why is it so.

A police source maintained that the local police is often influenced by the local factors whereas the paramilitary forces are not involved in day-to-day affairs of the civil society. Moreover, the local police is also subject to various local pressures as it is in day-to-day touch with the people of the concerned city or town. They develop even intimate contacts with one section of the society or the other. The police is often found in league with criminal elements also and specially those who have been politicised. These criminal elements are often involved in these riots on one side or the other. For example, in Bhagalpur riot, the criminal gangs openly participated in the riots and these gangs were divided on communal lines and also some criminal elements from amongst the Muslims had sought to seek revenge on some police officers taking advantage of the situation. The paramilitary forces, it is obvious, are not exposed to such local power equations. Thus they are able to behave more impartially. They take action only against the real offenders. As for the brutal behaviour of the PAC and SRP my findings show that though they are an isolated lot (away, like the paramilitary forces from local influences), their very training is to brutally attack in order to restore law and order. Secondly, like other police people, they do not get chance to be appointed on lucrative posts and on such occasions they see a chance to make some money by participating in the loot.

During Ahmedabad caste riots many dalit women told us that the SRP forces snatched away their '*mangalsutra*' and other gold ornaments along with the cash. Similarly in Jabalpur riot of 1961 we heard similar complaint about SRP from the Muslim women. Their *mangalsutras* and gold ornaments were also snatched away by the SRP men. This of course explains their brutality and greed but not their communal attitude. What could be the explanation for that. One reason could be that they function in riot situation in close co-ordination with the local police. But this seems to be a partial explanation. Lack of proper secular orientation in training also seems to be the other factor. The police constabulary also suffers from lack of such training.

It would be unfair to condemn the whole force as communal. The police does have communal elements within its fold but also have secular elements among them. I have found that the top officers are often much more secular than the lower constabulary. Of course, one can find communal elements among top officers too, but it is not as rampant as among the lower ranks. In fact we find some very committed officers who tackle the communal situation very honestly and with a sense of integrity. It is a different thing that they may not succeed for host of other factors, one among them being political. Such officers are even transferred for their secular orientation and sense of duty. I have personally known many such officers. Among them too there are two types: those who fight for their convictions and even suffer and those who surrender to the whims of political bosses. It goes without saying that there are always very few people who are prepared to pay the price for their convictions.

The picture radically changes when it comes to lower officers and the constabulary. They are much communalised. It should also be said that they behave harshly with all weaker sections of society including poor of the upper castes and, of course, dalits. There is something fundamentally lacking in their training. It is also partly because of the whole corrupt political atmosphere in the country. There is no value of human life and specially for weaker sections of society. And it is constabulary which actually matters in the field. Thus those who shot innocent people in Govandi during the December 1992 riots were of the level of inspector and below. But the deputy commissioner of police Y C Pawar saved the situation. We should also acknowledge that some higher officers in Bhivandi showed great sense of commitment and maintained peace by forming mohalla committees and keeping undesirable elements in check. In fact, all other police officials must learn a lot from them. It is, therefore, these lower officers who need greater sense of discipline and reorientation training. But it is regrettable that various police training centres impart training to higher, rather than these lower grade officers.

It is also important to understand some of the problems of the lower officers and constabulary also. They are terribly overworked during communal disturbances. They are often required to perform round-the-clock duty on such occasion. They hardly have time to go home. Also, they perceive danger to their life. It is not easy to work in such conditions. Such tension makes them highly inflammable and they tend to overreact to any situation. They take revenge on innocent persons. Also, they are deeply affected by communal propaganda like any other human beings. Their perceptions about Muslims are formed by such political progaganda. They also think that all Muslims are aggressors, violent and fanatic and that they are mainly responsible for starting the riots. One or two selective incidents which come to their notice reinforces their perception. For example, some Muslims (mostly anti-social elements) attacked policemen and even killed few of them during December 1992 riots in Bombay. Also some Muslim youth attacked government properties and Hindu shops, temples, etc, on the morning of December 7. In Govandi area too, two police constables were done to death and two temples were damaged. This is bound to anger the

policemen, specially at lower levels. A high police official told me that news of attack on police constables had angered all policemen, including top officers. Despite this some top officials did not lose their cool. Though one constable was done to death on December 7 in Bhindi Bazar area and two temples were attacked the assistant commissioner of police Zende did a good job of restoring order in Dongri area and saving many Muslim lives. Some Muslims from that area told me that but for Zende, many more Muslims would have been killed. Thus some incidents do reinforce the police perception about the Muslims. In fact one of the causes of excessive firing during December riots by the police was their perception that Muslims are fanatics and aggressors and unless dealt with severely, they cannot be controlled. Such perceptions can be changed only through intensive training and reorientation of their attitudes towards minority communities.

One also has to take into account the role of the rumours even on the minds of the police. Many rumours deliberately spread by the miscreants to engineer riots affect the police mind as well. Sometimes even high officials get affected by these rumours. When I was investigating the Nelli riots in Assam, I questioned the district magistrate about the main cause of the riot and I was horrified to learn that even he is victim of the rumour that the Bengali Muslims cut off the breasts of some Hindu women and displayed them in the Hindu areas to show their prowess. This is unbelievable but true. One can imagine that havoc rumours can play in the riot situation. It is generally believed by the police men also that Pakistani weapons are coming to be used during the riots and that ISI is behind these riots. During December riots a police source had claimed that near Minara masjid there was firing from Ak-47 which was totally false. No proof was subsequently submitted for this claim. The rumours were so strong that even the then governor of Maharashtra C Subramaniam was carried away by it and he made a press statement that there was 'foreign hand' behind these riots and that he would prove it. He never submitted any 'such proof'.

We have to take into account the general political atmosphere at the time of the riots. In last few years the communal forces have highly vitiated the whole atmosphere. The Ram Janmabhoomi-Babri masjid controversy played havoc with communal peace in the country. Even highly educated middle and upper class people were affected by the communal wave which swept the country in last five years. The policemen can hardly remain unaffected. They are as human beings as vulnerable to communal propaganda as any other human being. In such an atmosphere one requires highly motivated police officers to handle the situation objectively and dispassionately. Even such highly motivated officers would require full political backing. The ruling politicians themselves had surrendered themselves to the communal forces; it came to be termed as 'soft communalism' by some journalists. The role of the prime minister himself came under shadow of doubt. He watched helplessly when the Babri masjid was being demolished. Such political behaviour certainly sends wrong signals to the police and other officers. Before Ahmedabad riots of 1969 too the whole political atmosphere was vitiated with communal poison. Very few police officials can maintain their poise in such communally surcharged atmosphere.

It would require extraordinary political will to fight this communal poison. But our country's unity and integrity very much depends on strengthening secularism and pluralism. This message has to go repeatedly to the police also. Every communal riot is a serious blow to our unity.

GATT and Patenting of Micro Organisms

Suman Sahal

Vital economic sectors linked to micro organisms—agriculture, pharmaceuticals and industrial biotechnology, to name just the most important—will be severely affected by the acceptance of patents on micro organisms.

WHILE opposing Intellectual Property Rights on living organisms because they were detrimental for India; Gene Campaign had in the public focused more on the consequences of seed patents. This was because it was a more direct issue to peg a campaign on than micro organisms. We have however consistently fought against patents on micro organisms as well.

During our consultations with the commerce ministry, Gene Campaign had pressed the case that India should refuse to accept patents on micro organisms for a variety of reasons. At best it could grant protection on products derived from such organisms, that too for a specific use, but under no circumstances, should it accept patents on the organism itself. This position was not defended and we will now have to change the Indian Patent Act of 1970, to include life forms as a patentable category. This is a dangerous precedent as the American experience will show.

Micro organisms refer, as their name implies, to very small forms of life. In this category are included such living creatures as bacteria, virus, fungus, algae (the green scum that grows near water), small plants and animals and, according to the lexicon of corporate biotechnology, even genes.

The overhaul of the American patent laws began in 1980 with the grant of a patent on a micro organism to Anand Chakravorty of the University of Chicago. The patent was granted for a strain of bacteria that could metabolise oil and other complex hydrocarbons into harmless products and was seen as a promising agent for cleaning up oil spills.

This historic decision set the ball rolling for patents on higher and still higher forms of life. In 1985, the American law-makers awarded patents on plants and in 1988, a patent on a mouse which is a mammal, the same category of life forms to which humans belong. There are strong ethical objections to patents on life and in our case there is the danger that the juggernaut of patents will be harder to stop once we have conceded the first step.

The acceptance of patents on micro organisms makes complete nonsense of the government rhetoric that India will not accept patents on naturally occurring genes. All the genes of bacteria and fungii and other micro organisms that have been patented are natural. And while we are on the subject, let it be known that there is no such thing as an artificial gene as yet. All the genes that are being used in agriculture and biotechnology today, the genes of corporate interest, are genes that exist already, they are natural genes.

With the tools of genetic engineering it is now possible to shift genes from micro organisms to plants and animals and vice versa. When genes from micro organisms are transferred into higher plants and animals to make what are called 'transgenic' plants and animals, that is plants and animals containing diverse foreign genes from various sources, patents will have to be given for the transgenic construct which in fact will work like a patent on the plants and animals themselves.

That is not all. There is a concerted effort on the part of the multinationals involved in biotechnology to push for changes in the definition itself of micro organisms. Micro organisms should now, according to corporate philosophy, include such new categories as cell lines and genes. This will greatly enhance the scope of patents under the micro organism label since many cell lines are from plants and animals and even humans. The inclusion of genes as micro organisms means that a patent granted on a transgenic construct will automatically translate into a patent on that particular plant or animal

The patenting however of the classical micro organism alone will wreak sufficient damage for us to have every reason to reject it outright, does not matter what the government says. There are vital economic sectors that are linked to micro organisms. To name just the most important: agriculture, pharmaceuticals and industrial biotechnology will be severely hit by these patents.

In the field of agriculture, the future belongs to bio fertilisers and bio pesticides. International experience with intensive agriculture patterns has shown that the current level of agrochemical use is not ecologically sustainable and will poison our land and water. There is therefore a great effort to seek benign substitutes for chemical fertilisers and pesticides. These bio substitutes are based to a large extent on micro organisms.

The world of microbes or micro organisms promises ever increasing opportunities for improving plant nutrition and warding off pests. Biofertilisers are preparations containing a mix of cells which can provide nutrition, chiefly the major nutrients nitrogen and phosphate, to plants. India, China and other rice growing countries have successfully begun to use microbe-based biocultures to supplement chemical fertiliser in paddy cultivation. Biofertiliser use is now being extended to other crops with very good results.

Although traditional farmers were well versed in the use of certain kinds of biopesticides to control diseases and pests, intensive microbe based weed and pest control strategy has been refined in the last few decades. The capabilities of various fungi, bacteria and viruses are being tested to control insects and plant pests that compete for energy and nutrition and so damage crop plants.

The most promising of the new approaches has been the bacterium Bacillus thuringensis whose toxic properties have been used effectively as a biopesticide in several kinds of crops. Incorporating the toxic gene into crop plants by genetic engineering reduces the use of chemical pesticides. Now the toxic genes of tiny bugs and mites are also being tested for genes that could be built into plants to create transgenics that would carry their own biopesticide.

According to estimates, India could with an investment of Rs 30 crore in biopesticides, replace at least Rs 200 crore worth of imported plant protection chemicals. Although we have indigenous know-how, our efforts at translating this into market-viable products will need a gestation period.

With India having accepted patents on microbes, foreign companies can now obtain and start operating patents on products they already have, and get a head start on developing new categories of biofertilisers and biopesticides.

It cannot be repeated often enough that opening to unequal competition before we have geared ourselves for facing that competition will mean severe setbacks for the Indian scientific community and for Indian industry. We should follow the example of industrialised countries in this regard. They have tailored their Intellectual Property Rights to the stage of their technological development. A G-7 nation like Italy agreed to product patents in the drug sector as late as 1982 and Spain even later in 1987.

Biofertilisers and biopesticides will be of increasing importance to Indian agriculture as pressure mounts from environment lobbies to move away from agrochemicals. Seeing the growing nexus between trade and environment, this is to be expected. It also cannot be ruled out that similar to the trade-environment manipulation, this area can also be manipulated in favour of those in the market already by demanding early phase-out deadlines for agrochemicals. India may find herself in a situation where the new brand of pesticides and fertilisers are to a significant extent under foreign patents.

Many people do not realise that several kinds of drugs are derived from micro organisms. The patenting of life forms will strike at the very foundation of indigenous manufacture of these categories of drugs. If, for example, a particular multinational like Sandoz patents the fungus that produces penicillin, then no other company will have the right to manufacture penicillin, since Sandoz will have acquired absolute rights over that particular fungus

A country like India will therefore be forced to buy penicillin from Sandoz, paying the absurdly huge sums of money that Sandoz in its monopoly position will decide to fix. The Indian drug industry will lose potential profits and the Indian consumer will have to pay very high prices for drugs that are manufactured from patented and therefore exclusively owned organisms

Recently a Baroda-based pharmaceutical company has succeeded in developing indigenous technology for the manufacture of Roxythromycin, a highly effective antibiotic against respiratory, skin, and urinary-genital infections, and therefore of special relevance to India

Once patenting of life forms becomes operative, such developments will become impossible Even in the case of Roxythromycin, an American company has so far a monopoly on the drug, but since the micro organism that synthesises the drug is not yet patentable, the Indians could develop their own technology to produce the antibiotic.

With the advent of recombinant DNA technology, or what is popularly called genetic engineering, the last decade has seen a revolution in the methods of manufacture of those drugs that were originally obtained from animal and human tissues Now, the genes that direct the synthesis of such compounds like insulin or clotting factor VIII have been identified and located.

With the tools of genetic engineering it has become possible to cut out the gene for, let us say, insulin synthesis, normally found in the pancreas of animals and transfer it into a strain of bacteria Once planted inside the bacteria, the gene for insulin continues to do in the bacteria what it did in the pancreas of the pig, namely, produce insulin

The advantages of this approach are many Since bacteria grow very fast and quite easily in the laboratory, the quantities of insulin or any other drug they produce is several times that extracted from the pancreas, or other tissues of animals. And it works out much cheaper.

This kind of genetic manipulation has become so well established as to have become a routine method of production since 1982, when the first biotechnologically-produced insulin was released on the market. The bacterial strain found most suited to act as a 'bio factory' for drug production is Eschericia coli, bacteria that are normally found in the intestines

What is being done with insulin is also being done with human growth hormone which is used to treat dwarfs and Interferon which is a sort of wonder drug promising cures for conditions as diverse as cancer and viral inflammations. And this is only the beginning. Many more drugs are in the pipeline waiting for approval from drug regulating agencies that are rightly cautious about releasing genetically altered products

Not just bacteria, other micro organisms like yeast have also been deployed as bio factories. The most notable product from the yeast factory is the serum to counter the chronic liver inflammation brought about by infection with Hepatitis B, which produces a more virulent and dangerous version of jaundice. This is a special problem of developing countries, being the cause of two million deaths per year.

Since the Hepatitis B virus has refused to grow under laboratory conditions, it has been very difficult to produce a vaccine against it. Vaccines could only be produced from the blood sera of infected patients, an obviously limited and extremely expensive exercise. Yeast factories producing vaccine sera since 1986 have saved the lives of many infected with this dangerous disease.

Just like bacteria and yeast, cultures of single cells from animals like guinea pigs and hamsters can function as units that manufacture pharmaceutical compounds. Hamster cell cultures now churn out alpha 1 Antitrypsin (AAT), a front runner in the treatment of emphysema and other degenerative lung disorders. Also obtained from animal cell cultures is tissue Plasminogen Activator (t PA), a revolutionary drug that dissolves blood clots speedily and saves patients suffering from acute heart attacks, who were not surviving before.

Till genetic engineering came along, t PA was not commercially available. It is found in such low concentrations in the arteries that it would require 20 tons of human tissue to extract one single gram of t PA—clearly an impossible approach. With recombinant DNA technology, t PA, although expensive, has become available for heart patients.

Another drug which has become possible because of these modern methods is Interferon. Showing great promise in the treatment of certain cancers, viral infections and chronic tissue inflammations, Interferon was quite simply unaffordable ten years ago. Today it is possible to produce it in kilos, thanks to bacteria called Eschericia coli.

What would happen if some company patented the strains of Eschericia coli that accept the genes for insulin, t PA or Interferon, and synthesise these drugs? What would happen to the cost of medical care in poor countries that would be denied the opportunity of manufacturing these drugs themselves and be forced to buy from the patent-holding company who had a monopoly in the world market?

With respect to the field of industrial biotechnology, it is estimated that in the coming two to three decades, 60 to 70 per cent of the global economy would rest on biotechnology, because this is perhaps the most versatile of all the technologies that we have seen so far. Biotechnology will contribute not only to food and drugs but also to the fields of energy, mining, feedstock chemicals, pollution control and water treatment. Several of the products that were derived from chemical processes can now be derived from biotechnological methods which are much more environment-friendly since they produce less pollution.

Biotechnology today produces several classes of compounds like antibiotics, mycotoxins and pigments. The fermentation technique produces energy in the form of biogas which can be converted to other forms like alcohol-based fuels. Feedstock chemicals like polysaccharides, citric and amino acids, nutrients like vitamins and proteins, organic solvents like acetone are all being produced through micro organisms.

Micro organisms have become important in mining where cultures of specific bacteria can 'feed' on ores to extract the metal. This is of special importance in recovery from low grade ores that are not economically feasible by classical methods. Special strains of bacteria are being used to extract metal from poor quality iron ores, from low grade gold and silver ores and for harnessing gold from waste water. Microbial cultures to break down pyritic sulphur from coal are being used to reduce sulphur dioxide emission during coal combustion.

Micro organisms are being increasingly used in cleaning industrial wastes and purifying effluent waters. Microbes that can extract heavy metals from effluents, degrade plastic waste and clean up oil slicks have found a prominent place in pollution control and are being traded under patents. India will have to contend with foreign companies offering patented microbes and capturing the market before Indian efforts in this direction are able to take off.

All this is particularly galling since for a variety of reasons. India could emerge as a global player in biotechnology if it was not hamstrung by an inequitable patent system totally out of touch with its requirements. I suspect part of the reason why we find ourselves in this unenviable position is that the bureaucrats who are sent to defend India's position are simply not educated to handle negotiations in highly complex areas.

On the negotiating teams of industrialised countries, representatives of industry, technical experts, lawyers and others who understand the subject matter are prominently represented. Let us learn from those who have succeeded in defending the interests of their countries far more competently than we have been able to.

Redefining Gandhi

A Relevant Exercise

Sanjoy Ghose

There is much in the Gandhian movement which needs to be preserved and redefined in the modern context. Can the movement rise to the challenge?

IT was an historic occasion. Four teams had set out on foot on December 25, from the four corners of Rajasthan, and were all congregating in Pushkar on February 12. Their mission was to take the message of Gandhi's 'Gram Swarajya' to the people, to realise Gandhi's vision of a humane society. A social framework built on values of caring, and sacrifice—without the violence of the class struggle inherent in Marxism or the violence of the free market, where profit and money have destroyed the carefully nurtured sense of community.

Sidhraj Dhadha, the flagbearer of Gandhian thought in Rajasthan over the last three decades (by coincidence it was his 80th birthday, the day of the reunion at Pushkar), was one of the marchers. The other teams were led by senior workers from the khadi 'jamaat' from different parts of the state. Perhaps the one exception was Savai Singh, the 30-something secretary of the Sarva Seva Sangh. A product of the JP-inspired Chattra Yuva Sangharsh Vahini, Savai who speaks the language of mobilisation, and conscientisation, and power to the people, represents the new hope for the future of Gandhian action in Rajasthan, drawing on the other-isms to enrich this middle path

The Sammelan itself, the culmination of the 50-day 'padyatras', was well attended. There must have been close to 400 people. The Gandhians and the khadi institutions were there in force, but there was a healthy sprinkling of the 'NGO types' as well. There was Rajendra Singh, who has been fighting the mining lobby in Alwar, Tyagiji from Jodhpur, Narendra Gupta from Chittorgadh, Kishore Saint from Udaipur—almost like a Who's Who of voluntary action.

Another constituency that was represented was the 'Gramdaan' villages. Gramdaan villages are those that have organised themselves under the Gramdaan Act. The provisions are unique. Every adult is entitled to be a voting member of the gram sabha, where all major decisions are taken, by consensus. Every family puts aside 5 per cent of their production into a village fund, and all the landed people have to agree to part with 5 per cent of their land to redistribute to the landless in the village. All the records are kept in the village, and private ownership rights are transferred to the community. It is almost a utopian concept, in this modern age, but there are 213 of these villages in Rajasthan, and several of the chairmen of the gram sabhas were there at the Sammelan.

The sections that were conspicuous by their absence were politicians, and the government. Also overall there were hardly any women. They were absent from the stage certainly, from where all the speeches were being made. Shashi Tyagi and Mamta Jaitley, as token representatives spoke of the need to broad base the movement and involve women with a sense of their empowerment, but coming as they did sandwiched between speakers, it did not seem quite so serious.

The first day was recollections of the yatras, and most of the teams spoke of the warmth, and the hospitality from the 'people'. Some common threads emerged from all the presentations: as societies have progressed, and 'developed', there has been an increase in alcoholism, and violence. Now the audio-visual medium has reached its tentacles into virtually every household, and 'dhani'—it is difficult to find people that have not come under the influence of the medium—which most people felt was the main reason values have changed so fast. Some people spoke of the sense of powerlessness that villages experience, being part of the state apparatus, with no control over their land, water and forests, unlike in the past. All the padyatris had similar feedback on peoples' attitudes to political parties, and the way that the democratic system had established itself. "It's a mess, but what choice do we have?" was a frequently heard refrain.

What seemed noticeably absent was a differentiated view of society. It was almost as if everywhere "the people said", which is hardly the way it is. The perspective of women, and the poor tends to get subsumed in this homogeneous notion of community, and village. It is this lack of differentiation that one is very uncomfortable with, in the notion of Gram Swarajya as one understood from the 'yatris', and the Sammelan. At one level, there is fierce opposition to the terms of the now infamous Dunkel Draft, on the ground that we need to protect our interests from the vultures of international capitalism: yet we accept the blood sucking of the moneylenders and the vicious barriers of caste as if these were minor aberrations in the way of an 'ideal' society.

On the second day of the Sammelan, there was a meeting of a small group of representatives of the various constituencies attending the meeting. I was also a privy to the discussions, that were conducted in a remarkably open spirit. There was a genuine attempt to arrive at a common understanding of the issues, and then draw up an action plan. The meeting was being co-ordinated by Sidhrajji, and kept referring back to Thakurdas Bang, who seemed to be playing the role of patron, and oracle, pronouncing judgment as issues kept being tabled. Again, the discussion veered around to the Dunkel Draft, and the need to oppose it: when someone pointed out the small window it offered in terms of providing employment through access to overseas markets for handspun and handwoven fabric, the proposition was accepted with disbelief, almost heresy. So also the fact that the television medium needed to be understood, and mastered, rather than opposed. But nonetheless, the tone of the small group meeting augured well for the larger general meeting later

But alas, that was not to be. One after the other speakers came up and tried to explain the cause of today's misery: from the silting of Pushkar, to the arrangements made for Sidhrajji during the padyatra, everything featured for a while. And the irony was that throughout the proceedings the language was Hindi (which many of the tribal villagers there did not understand), and all the speakers were representatives of institutions, none of whom were either from villages, or actually living in the villages they so much wanted to liberate.

Except for a small interruption, that enlivened the event. A man called Gopal camp up and introduced himself as one of the padyatris, and said that instead of all this talking, how maby people were willing to dedicate themselves to the cause of Gram Swarajya? He said he would start with himself, and pledged to work in 10 villages till the cause had been achieved. There was much clapping all around.

At the end, the organisers were really pressured for time. Everybody wanted to speak, and the harassed co-ordinator kept

appealing to people to take back their slips (on which they had written their names, and requested time to speak), so that the chief guest could enlighten the gathered audience on the subject, and so it was. Bang dwelt on the philosophy of Gram Swarajya for an hour, and exhorted all to beware of the Dunkel Draft, and the ominous portents that it had for village society.

I came away with a sense of emptiness, because one feels the need to redefine Gandhi in a modern context: preserve the values, but come to terms with the changes. To my mind, there are some areas that need to be explored and understood to come up with an alternative framework.

Participation: The earlier context of Gandhi may have been the 'guru-sishya parampara', with the notion of teacher and learner, but the pace of change means that we must be prepared to stand this notion on its head For instance, the stand on Dunkel seems to have a mandate from the people. But does it? Has there been a process of dialogue, with information, and allowing people to make up their own minds, before deciding on a strategy, or policy? It is true that the roots of trusteeship, and Gramdaan are participatory—but before we start asking people to participate in their own development, we need to examine the state of our own institutions. Who is the leadership accountable to now, and how participatory is decision-making? How far have we been able to keep the character of 'membership' organisations that Gandhiji so respected? Are these organisations listening to people, and feeling the pulse that Gandhi knew so well? He had a vision for this, and perhaps that is why in his autobiography he mentions how he is against the concept of 'permanent' funds for institutions, and how they need to keep going to the public.

Gender: A much abused word and concept, but unless the Gandhian movement can mainstream the idea that women have equal status, and are equally competent, rhetoric will only keep the presence of women as token. The involvement of women needs to be seen in a new perspective—perhaps they can get empowered through the movement, but the converse is equally true. They can empower the movement, and make it more relevant to people. In the Gram Swarajya Sammelan, Mamta made a valid point: there are thousands of women linked to the khadi institutions as spinners, but has anyone even once questioned why they are so poorly paid compared to the male weavers?

These are the kind of issues that need to be taken up, recognising women as economic producers, and heads of households, not merely as supplementary income earners, crutches, or a "service" cadre. The immediate implications for the institutions are that women must be given positions of leadership and authority, and allowed to determine their own agenda.

A clear strategic direction: There must be a clear message for people—the cadres, and the membership, to identify with. Within this direction, within this message, there must be symbols that will capture the imagination of people, in the way that the salt satyagraha, and the bonfires of imported clothing did a generation ago. If this appears cold-blooded, and pre-planned, with all the baggage of manipulation, so be the appearances. But if the method stands the test of Gandhi—truthful, non-violent, a concern for the poorest, it should pass muster.

An example of how the form this direction could take is in the reaction to liberalisation. If the Gandhian institutions can take a clear stand on fighting to save what remains of our social infrastructure—health, education, housing, public distribution system, rural credit, they would bring to the forefront the injustices on the poor, and prick the conscience of a nation, in much the same way that Gandhi touched the hearts of the world almost 40 years ago.

Mass media: The gut reaction is to close the windows on a cultural invasion, but that again is to fly in the face of public opinion. If the media could be understood as exactly that—a medium—devoid of the baggage of liberalisation, and the images of 'Bold and Beautiful' and Michael Jackson, which have come to symbolise the New Age—one could develop a strategic approach, give people alternative information and messages that would help them act, and change their lives and those of the community around them, in the spirit of Gandhi. Gandhi was not against technology *per se*, merely the idea of machine being the father of man, rather than within people's control.

The fact that television empires are built on viewership and advertising should not make one shun it on the grounds of ideological impurity. Unless there is sufficient organisation to get the message out, in a form that people can understand, and want to accept, it will only be a choice between the pervasive influence of television broadcasting into homes, countered with a cyclostyled alternative in the form of *Sarvodaya Jagat*, or such magazines. The metaphor is not wholly apt, but illustrative. Of course the media needs to be controlled. There are the censor boards, the ban on cigarette and alcohol advertising (and perhaps soon baby food). But that has had a marginal impact, compared to the many sources that reinforce the stereotype. If there are examples of Gramdaan that have empowered poor communities, and that represent alternative values and lifestyles, cannot they be made part of the armoury to change society in a different direction?

People are searching for a more meaningful way of living, and given the disillusionment with the state of affairs in the world around, circumstances might propel people in this direction—provided that it takes a form that is understandable and appropriate, in the modern context.

The market: This is perhaps the most difficult to come to terms with. Seen as inherently exploitative, the Gandhian stance is ambivalent. On the one hand, we accept the end of the barter economy (albeit with regret), but the market has come to be associated with the profit motive, which is linked to crass commercialism, and the emergence of the selfish instinct in man.

It is true that market forces have often (almost invariably) disenfranchised the poorest, given that their initial conditions hardly make for 'free' or 'perfect' markets, but it is also true that markets present opportunities to break out of old patterns of dependence and patronage. In the west we have had the emergence (and decline) of the green parties, a burgeoning market for the concept of recycling, and the interest in organic farming. There is a growing market for handspun, handwoven, vegetable-dyed khadi, not only because it is attractive in itself, but because of the alternative lifestyle and ethos that it represents.

All aid is now tied to 'sustainable' development projects—and it is only a matter of time before the definition veers from being entirely production-based to being consumption-linked as well. Questions need to be asked about how much is being consumed by whom, in addition to the question of production. There is a very rich debate on the issue in the environmental field, in the assessment of the costs of pollution. The rhetoric on the other side of the population debate draws on the Gandhian concept of there is enough for everyone's need, but not for everyone's greed.

Of course, all these are still very much on the fringe, but have the possibility of becoming part of a mainstream transformation, provided that the Gandhian movement can address these issues sensitively, and take the opportunities that present themselves.

Village Industry: Struggling to Survive

Jaya Jaitly

The deteriorating condition of village industry, the result of long neglect made worse by the recent economic reforms, is an ominous sign.

POLICY attitudes towards the producers of handcrafted or handwoven items has been clearly coloured by colonial perceptions. The formal description of 'handicrafts', makes no differentiation between skilled handwork and artistic handwork. In India artistic manufacture whether for community occasions such as festivals or for daily use in domestic or farm life is an integral part of living, but this was at variance with the compulsions of the western industrialised world which partitioned craft and industry into compartments. Village industry was idealistic, romantic, a fading relic of a past age, while capital-intensive industry was the hub of the financial world across the globe. A 'man's' world of practicality corporate images, centralised control, economies of scale, stock exchanges and global strategies to capture markets.

This western thought process was readily adopted by our policy-makers who, while claiming to be influenced by Mahatma Gandhi handed over the daily business of administration to a bureaucracy that still spoke in clipped British accents, wore three-piece suits and followed all the laws and procedures established by the erstwhile rulers. Handicrafts and handlooms were viewed as elitist objects for exhibitions and export rather than as an integral part of rural industry with its tremendous potential for employment and markets in the domestic arena. It was always the commerce ministry or culture departments that dealt with exports, museums, festivals and "culture" at its most highbrow that also administered the traditional industries. For a brief interval handicrafts and handlooms were brought together with the rest of village industry and received support from the newly created district industries centres, massive handloom promotion expos all over the country and, most importantly, protection for 817 items in the cottage tiny and small scale sector through reservations so that village industries would not be smothered by large industry. Village crafts, whether it was the ordinary leather 'chappal' or earthen 'kulladh' were to receive support along with the more fancy products made for upper class drawing rooms. These seemed a harmonious way of dealing with industries, both hand and machine varieties. Unfortunately, a change in government and a reversion to earlier attitudes prevailed and in 1980, handicrafts and handlooms were shifted back to the commerce ministry and then to the newly created ministry of textiles. Artistic, i c, Elitist handicrafts are supported here while common crafts remain under the ministry of industry to be obliterated by the powerful lobbies of industrial tycoons who dominate policy formulation.

Take the policy of financial allocations for the Khadi and Village Industries sector. It is well known that apart from some advancements in the technology of the spinning wheel and the loom, in village industries such as rope making, mat weaving, paper making, oil extraction, soap and match-making and so on, there has been almost no new technological input. It was not even necessary in certain areas since the local, traditional technology was adequate, simple and appropriate. However, while the network of KVIC is vast, its employment potential immense, its marketing outlets far outnumbering outlets boasted of by multinational hamburger joints like MacDonalds, the outlays for the KVIC have dwindled over the various five-year plans (see the table). In the Eighth Plan KVIC has been told to go to the banks and borrow money at commercial rates of interest for any investment in development work. The outlay for industry and minerals is Rs 46,922 crore. Out of this Rs 6,334 crore is the total outlay for the entire village and small industries sector or a mere 7.4 per cent.

While earlier at least the public sector did not challenge village industry by producing competing items for sale, and concentrated inside on producing coal, steel, aluminium and wrist-watches or operating services like rail, air and road transport, the present economic policy will allow the import of all consumer items from anywhere in the world, dealing a final blow to our village products in the market place.

What happens to those village industries that do not come into anyone's portfolio? Among these are hundreds of thousands of basket makers, rope makers, potters, metalsmiths, leatherworkers, who, if they do not produce anything that catches the eye of the patrons of art and culture are left on the roadside both literally and figuratively, across the length and breadth of this land. There are no appropriate technologies, modified tools, or simple processes for access to quality raw material and finally, no market development to demonstrate that they have a right to be part of the great world of market economies. All of these areas of intervention are left to struggling Gandhians, voluntary organisations and low profile public sector institutions. The khadi sector has been a major victim of this neglect for, with a wide network of outlets it is still sustained only through a system of high rebates as an incentive to customers, and its products are not found on shop shelves where they would be expected. For instance, KVIC soap and match boxes are not on chemist's shelves or available at the corner panwala's kiosk.

How then with policies balanced against them, have village industries survived at all? It is the all pervading and rigid caste system of the Indian social fabric that has kept the traditional village producer tightly bound within his caste hierarchy, unable to reject his inherited skills and profession, and unable to receive the benefits of any progressive policies that may have lightened his load or created alternative employment. A potter therefore remained a potter, a basket weaver continues as such. Illiterate yet knowledgeable, handicapped yet productive, trapped within their social status and traditional profession which, if rendered obsolete forced them to move downwards to become part of the manual labour workforce or a migrant on city pavements. Today village artisans find their place amongst the lowest income groups. According to the 1989-90 study of the Operations Research Group, 69 per cent of total artisan households earn up to Rs 750 per month. With an average of five members per family this works out to Rs 150 per head or a mere Rs 5 per day to cover the cost of food, clothes, transport, medicines and schooling. Most are landless. They have to make a choice between basic necessities or the purchase of raw materials, fuel or equipment for carrying out their work--little wonder they become bonded labour or sell their souls to exploitative loan sharks or middlemen. The condition of 29.6 per cent of these households are even more pitiable as they earn only an average of Rs 350 per month, which works out to an unbelievable Rs 2.30 per head each day. Is survival possible? Certainly not. What happens then? Let me illustrate with cases that are within firsthand knowledge.

Struggle to Survive

The story of Kodungallur in Kerala involves over 20,000 women engaged in weaving mats made of screwpine leaves. Their husbands are fisherfolk displaced by the advent of the air-conditioned high technology fishing trawlers which are now appropriating more and more of our 8,000 kilometre coastline. Having become breadwinners of the family, they purchased raw materials for Rs 6 per bundle with money borrowed at 28 per cent interest, wove a mat in two days; selling it for Rs 10, and earning Rs 2 per day for their labour. Unable to feed their family and repay the loans two women committed suicide. Sustained work in forming first a union, and then a co-operative

society, persuading local banks and the IDBI to provide small loans, seeking local support and doing all those things that only self-sacrificing souls can persevere with against political, bureaucratic and social odds, today they earn over Rs 10 per day and have a feeling of being participants in building an unified organisation which brings their present and future back within their own control.

In Andhra Pradesh the mass starvation deaths and suicide were covered in all the newspapers Handloom weavers, according to the handloom census of 1987 states that 14.32 lakh weavers earn Rs 501 and above per month, 13.34 earn between Rs 201 and Rs 500 per month, and 2.04 lakh weavers earn Rs 200 a month which is less than a rupee a day.

Just before the announcement of the 1985 textile policy production figures for mills, handlooms and powerlooms were calculated by government. The production in mills rose from 3,132 million metres in 1982-83 to 3,515 in 1983-84 but declined to 3,338 million metres in 1984-85. Whereas the production in handloom sector grew from 2,788 million metres in 1982-83 to 2,294 in 1983-84 It increased to 3,131 million metres in 1984-85. The powerloom sector saw an increase in production from 4,694 to 5,355 million metres in 1984 85. Of the three sectors, handloom provides employment for 57 lakh people as compared to 32 lakhs in powerloom and 8 84 lakhs in the mills. The budgetary allocation for the textile sector in 1991-92 was Rs 942 crore and reduced to Rs 848 crore in the revised estimates. The budgetary allocation for 1992-93 is Rs 861 crore The handloom sector which was allocated Rs 257 crore in 1991-92 found the amount reduced to Rs 216 crore in revised estimates. In 1992-93 the handloom sector was allocated Rs 249 crore. So much for our past policies

In a small village in Kerala 80 out of 100 families of potters turned to depending on their womenfolk's earnings from prostitution to help them survive the tragedy of the loss of their traditional markets. Today a revival programme has been undertaken to make their skills relevant and encourage society to create markets for their products.

Here we should divert our attention to the situation of rising unemployment in the technologically developed countries, and relating it to our current policies of industrial development which seek to globalise by imitating their technologies or replacing our goods with theirs.

Global Village

At the Euro summit held in October 1993 there were serious apprehensions raised among the 12 members of the European Community about labour unrest in France and Germany this winter. There is increasing talk of a four-day week to enable workers to share work while companies reduce their pay rolls and cut costs to remain competitive. The EC desperately needs to create 20 million jobs if the unemployment rate is to be halved from its current 10 per cent plus. Asahi Bank in Japan estimated in a report in October that Japan's true unemployment rate is 6.5 per cent if 'hidden unemployment' is also taken. Haruo Shimada, professor of economics at Keio University says "Life time employment as an ideology will always continue to exist because Japan will always consider human resources to be important". His concern is that Japan should invest in new industries that will create new job opportunities before it is too late. In Italy as of August 1993 there has been a 26 per cent increase in the number of workers laid off from government schemes, and Confindustria, an employers body, has warned of an impending loss of 7,50,000 jobs over the coming months. The Italian government is worried that this may erupt into rioting and that the Mafia in southern Italy will take advantage of the situation too. An OECD report of its 24 member countries puts unemployment figures at 36 million, in the G-7 countries 7.2 per cent of the workforce is unemployed. Average unemployment among youth is 30 per cent in Spain, 20 per cent in France, Italy, Finland and Ireland. In the US it is 7 per cent. In Mongolia only 1/3rd of its people constitute the workforce. In Germany 10.3 per cent of the workforce is unemployed. Ever since the industrial revolution dovetailed into the technology revolution in the 1980s more and more machines replaced human labour and effort. The result today is this frightening recession. If people cannot work, they cannot earn, if they cannot earn they cannot purchase. So now we have the G-7 nations desperately protecting their industrial capacity by promoting the products of their multinational corporations in the third world, while president Clinton has announced the holding of a job summit in the US next year.

Unemployment figures in India are constantly high and would now be nearer 130 million people. As with death and deprivation, we have become insensitive to their sufferings and refuse to connect social and economic problems with joblessness. The mass of the workforce in India is still in the unorganised sector with those engaged in village industries second only to those engaged in agriculture. According to the Alternative Economic Survey of 1992-93 the unorganised sector absorbed about 90.3 per cent of the total workforce in 1971 and its share increased to 91 per cent by 1990, which includes underemployed or seasonally employed persons. The relative share of the unorganised sector in the total GDP has also declined over the period. The share of this sector in the GDP declined first from 72.5 per cent in 1970-71 to 66.7 per cent in 1980-81 and further declined to 60 per cent in 1989-90. A rise in the share of persons dependent on and a decline in its share of the GDP indicate a deterioration in the per capita earning of the persons engaged in the unorganised sector.

Analysed in plain terms we seem to be consciously killing our own golden geese. What happened in slow motion over the past 150 years is now being rushed through within two years—the current economic reform—which is in effect market reform and not reform that will bring prosperity to the poor. The new words in vogue are not 'people' and 'politics' which in its essence means the involvement of people in the creation of a humane and just society, but 'markets' and 'consumers' in which money power decides who has the right to occupy democratic space. With the rapid and facilitated entry of multinational corporations and financial institutions, allocation of farm land, bank credit, access to raw material, priority in transport facility—all these are being handed over to serve those who have the most economic power. Co-operative banks and rural credit which were the beacons of hope for those like our women of Kodungallur will no longer be available to serve the weak. They are already being forced back into the hands of loan sharks and unscrupulous local moneylenders. And when foreign products in every sphere of consumer need is brought to every village and small town shop, convincing the deprived that Coke and Pepsi is better than drinking water, and hi-tech cookware is more progressive than earthenware pots, our women in more than one village will have to return to prostitution.

In Thailand which is held up as an example of a successful structurally adjusted country, you can get Levi Jeans, Pepsi-Coke, Pierre Cardin T-Shirts and Reebok

Table

Plan Period	Outlay on Public Sector (Rs Crore)	Outlay on KVIC (Rs Crore)	Actually Received by KVIC (Rs Crore)	Col 3 as a Percentage of Col 2
First	1,960	15.00	11.58	0.8
Second	4,672	83.78	78.71	1.8
Third	8,577	92.40	86.90	1.1
Fourth	16,160	111.00	97.73	0.7

Seventh	1,80,000	540.00	611.21	0.21

shoes, but the resultant impoverishment of its rural industry has resulted in 95 per cent of all Thai men having slept with prostitutes; 5,00,000 Thais, i e, almost 1 per cent of its population are affected with AIDS. This is spreading through Cambodia and Laos via Burma to the north-east of India and, as a part of other types of global linkages will soon join up with the scores of villages in India. Projections for the year 2000 show AIDS being reduced from 17 per cent to 10 per cent in industrialised nations but increasing from 5 per cent to 25 per cent in south and south-east Asia. Let it be clearly and unequivocally understood that as a result of these policies, unemployment and AIDS will go hand in hand as the most deadly diseases of the next decade. It is by no means far-fetched to assert that this has a direct link with the rapid destruction of the productive, employment-oriented industries of rural India and will force our rural people to prostitution, starvation or suicide. A grim choice indeed in a world where multinational consumerism claims to offer the consumer a greater freedom of choice.

OIKOS means the economics of home management. A home encompasses the concept of people being a harmonious part of nature—one with its soil, water forests and clean air. This concept of the sentient being is common to all traditional agricultural societies of South America, India, Japan Thailand, China and Africa, but we cannot talk of eco-friendly products without making them people-friendly too. These products if made by industrial conglomerates that do away with jobs cannot be considered eco-friendly if they destroy the lives of traditional producers. Our choice of the earthen 'matka' as the Eco Mark logo is particularly ironic since steel and aluminium are wiping out the potters who make the matka. It is only if the principle of causing the minimum harm is used rather than of maximum profit and humans who produce goods and services are not marginalised and alienated from their skill, that the product would be genuinely eco-friendly.

It is here that we may turn to strategies for the future because we are poised at the very precipice of a situation where we can make the right choice for ourselves, or lose in a trice the collective wisdom of centuries. Let us look a little deeper at what is happening in the economically powerful countries today. Which are the words that are gaining currency amidst the aberrations of their culture? 'Organic', 'sustainable', 'eco-friendly'. Through Star TV viewers are asked to knit sweaters to keep warm rather than turn up the thermostat in central heating which wastes precious energy and depletes nature's resources. 'Health' foods like sprouted beans, yogurt, whole wheat, leafy greens without chemical pesticides are promoted. Natural fibres like cotton, silk and wool are far preferred to skin-clogging synthetics even by the working class for their uniforms. By working on a home computer people have brought work back as a home-based activity. Herbal extracts and oils are preferred by the cosmetic industry, fruit and vegetable extracts are part of exclusive, expensive soaps. Detergent factories with high chemical effluents are being penalised, and in Japan those parts of the production process that are not eco-friendly are being identified as inefficient and the corrective process is being applied. Anybody who is anybody boasts of using recycled paper. We have had these skills for centuries yet we are adopting alien obsolete technology with their obsolete development paradigm while we could be on par or, indeed, even ahead of 'developed' nations by taking the short cut back to our own rich resource of knowledge and skill which through traditional production methods protects the environment while sustaining employment.

Our traditional village industry uses local resources, the depletion and regeneration of which is the immediate concern of the local inhabitants. Transport costs involved in pre-marketing processes are minimum. The skills of a vast traditional reservoir are present. It requires minimum infrastructure if cottage based, home-based activity sustains the unity and integrity of the family unit and economies of scale are maintained Both costs and benefits are tangible to the producer. Most importantly it does not put people out of work We clearly have in our hands the only relevant technology for the future well-being of humankind

'Third Force' in South Africa

Ninan Koshy

The Goldstone Commission's report confirms the widespread belief about the existence of a 'third force' in South Africa organised or supported by the security forces. President de Klerk's decision to constitute yet another enquiry team will only be treated with derision.

THE recent report by the Goldstone Commission has only confirmed the widespread belief about active involvement and complicity of the South African security forces, including the police, in fomenting political violence mainly against the African National Congress (ANC) For the last three years evidence has been accumulating about the existence of a 'third force' in South Africa organised and or supported by the security forces to destabilise the transition towards democracy. It was just natural that the main target of the 'third force' was the African National Congress and the main beneficiary the Inkatha Freedom Party (IFP) Most of the actions listed by Goldstone, including the supply of weapons and fuelling of violence on trains and in migrant worker hostels were directed at helping the IFP the main black rivals of the ANC. The commissioner stated that he had prima facie evidence that the deputy police commissioner, general Basie Smit, was among those involved in dirty tricks

From the time that the state president F W de Klerk announced a programme for transition to democracy in South Africa in February 1990 it was known that a critical factor in the process would be the security system. There was fear that the security services trained, equipped and oriented to protect the apartheid system could destabilise the process. A similar problem was met in Namibia by a UN force. Domestic military elements, police and liberation armies alike were prevented from operation during the transition.

In South Africa, far from providing a non-partisan umbrella of stability, the security services have the legacy of fiercely partisan involvement in implementing P W Botha's 'total strategy'. Despite president de Klerk's repeated claims that the security services were fully under his control, the system did not change with the change of policies of the National Party. The incumbent regime assumed and claimed that simply because it precipitated a transition and publicly committed itself to a democratic outcome, that the state security system was serviceable as a neutral instrument in the process.

It is well known that the South African security forces were trained and deployed to defend apartheid and to wage war against the ANC and its members. Yet no programme has been implemented to retrain the security forces to serve a democratic society. Notwithstanding the known orientation of the security forces and the cases where the police officers have admitted in court that they were simply continuing the war against the ANC they had been instructed to wage, the government continued to insist that investigations of police complicity in violence must be conducted by the police themselves.

It was the Boipatang massacre of June 17, 1992 that sharply raised questions once again about the role of the security forces in violence. In addition to a number of non-governmental enquiries having pointed to the existence of a 'third force' the Goldstone Commission which by that time had published two interim reports had cited in-

stances of police and defence forces' involvement in violence including assassinations mostly of ANC member and supporters.

The Boipatang massacre brought to a halt the negotiations for democratic transformation under the 'Convention for a Democratic South Africa' (CODESA) with the ANC refusing to return to negotiations unless the government took credible steps to deal with the problem of violence. The ANC president Nelson Mandela in his letter to president de Klerk on June 26, 1992, spelling out conditions for resumption of negotiations, specifically raised the question of the involvement of security forces in fomenting violence. He publicly accused the de Klerk government of being responsible for political killings.

The massacre and the consequent collapse of CODESA drew renewed international attention to South Africa and the Security Council of the UN met to discuss the situation. This resulted in heightened international support for the ANC and a limited UN presence in South Africa to monitor violence.

While conceding that "the appalling events on June 17, 1992 have once again shown that the situation in South Africa is highly volatile and accompanied by a spiral of violence and counter-violence", president de Klerk maintained in his reply of July 2, 1992 to Mandela that "Contrary to ANC"s accusations, the government has not and will not plan, conduct, orchestrate or sponsor violence in any form whatsoever against any political organisation or community". He added, "The lie that the government is sponsoring and promoting violence remains a lie no matter how often it is repeated. Where elements in state structure in this regard, the government will not hesitate to take appropriate steps."

The president said that it was to cover up its own direct and indirect involvement in the creation of a climate of violence, that the ANC blamed the government and the security forces for the violence. In his reply of July 9, 1992 Nelson Mandela exposed the false claims by the government and gave further evidence to substantiate the charges. The latest report of the Goldstone Commission is a clear vindication of the position taken by the ANC already in July 1992.

While the government was always quick to condemn the ANC for violence, it as a rule refrained from any condemnation of Inkatha, even when there were numerous cases of leading members of the IFP planning, directing and instigating violence on a mass scale. Instead there were persistent reports of government protection of IFP warlords by the security forces. In case after case investigation concerning the involvement of the members of the security forces have been found to be inadequate and tardy,

The involvement of the security forces in incidents of violence has been already established through exposures in the press, in the course of some trials and in Commissions of Inquiry. The government has tried to deny its responsibility by claiming that individual members of the security forces had acted outside the law and their institutions and that such cases as were established had led to criminal persecution. This was not true as in the majority of such cases the government did not institute any action. On a number of occasions police officers involved in violence or in cover-ups have been identified by Commissions of Inquiry or in court judgments The government never took action in such cases. And so the 'third force' continued with vigour. There were a number of instances where the security forces not only failed in their duties but played an active and determining role in the fomenting and escalation of violence.

One case that revealed the involvement of the police in violence was the Trust Feed Case. On April 23, 1992 captain Mitchell and four constables were found guilty in the Natal Supreme Court of the murder of 11 persons at an area called Trust Feed in the Natal Midlands. The persons murdered were ANC supporters and at the time of the incidents, the violence was perceived as being the result of Inkatha ANC rivalry. In his judgment Justice Wilson referred to police complicity in the crime and stated "a disturbing feature of this case is that as the evidence went on it became clear that the evidence of senior police officials could not be accepted and official records produced form files were also subject to suspicion and shown to be completely inaccurate". It further emerged that captain Mitchell viewed the actions he had taken and the context in which they were taken as being a war situation against the ANC. In addition, the judge called for an investigation into the alleged cover-up of the investigations and the involvement of policemen in "counter-revolutionary strategy".

At Trust Feed a community was deliberately destabilised and hostility created between ANC and Inkatha supporters, leading to the establishment of Inkatha control over the community. The court heard from the policeman responsible that the police had previously assisted Inkatha by unlawful means to take over areas.

Revelations about hit squads had come already in 1990 through the Harms Commission. The Commission began its investigations in Pretoria in February of 1990 into the existence of hit-squads operating within the ranks of the South African Police, specifically at Vlakplaas, as well as within the ranks of the South African Defence Force, specifically the Civilian Co-operation Bureau (CBB). The report of the commission in December 1990 confirmed that a number of illegal acts were found to have taken place which were committed by both the South African police squad operating from Vlakplaas as well as the CBB. Such acts included attacks upon prominent anti-apartheid activists; attacks upon the premises of anti-apartheid organisations and included the bombing of Athlone House in Cape Town. No action was taken by the South African government against those involved and there was evidence that some of the squads continued to exist.

All these have to be seen against the background of the support given to Inkatha by the South African government and several of its agencies. Secret financial support from the South African government in the form of funding of rallies was exposed by the press in 1990. The South African government had to acknowledge this. Even though F W de Klerk stated in July 1991 that all secret funding to the Inkatha had ended in March 1990, there is evidence of funding to Inkatha rallies in 1991 and 1992.

At least 200 Inkatha members received military training from South African security forces in the Caprivi strip in late 1986 and early 1987. As in the case of other kinds of support from the government to Inkatha, this was exposed by the media and at first denied by the government. There is evidence of other training courses also held for Inkatha members. Several of those who have been identified as receiving such training have subsequently been involved in violent activities including participation in hit-squads activities. There were also well-substantiated reports of Inkatha's links with South African military intelligence.

The Kwazulu Police (KZP), a force under Inkatha control and membership of which effectively requires Inkatha membership, are trained and in many cases receive logistic support from the South African Police. The political partisanship of the KZP in their operations has been established by monitoring groups and in court cases.

The latest report by the Goldstone Commission has now given the final indictment against the South African security forces about their collusion with and support for Inkatha. The Commission has given all the evidence that is required for action by the government. F W de Klerk's embarrassment is understandable. His claim of the security forces being fully under his control is exposed unless of course he knew all along what had been going on. His announcement that the government would appoint an international enquiry team will be treated with derision. What more evidence does he need or the people want than what is given by Goldstone who has named the people involved? At the other end is chief Buthelezi claiming that he has been unaware of any help from the security forces to Inkatha. At a time when Buthelezi does not know what to do next and his political options are running out the Goldstone report has shown conclusively the sinister nature of Inkatha's collaboration.

Managing India's Nepal Policy
The Raj and After

Parshotam Mehra

Demands for a review of Indo-Nepalese relations and suggestions that an Indian initiative is essential for giving a "positive tone" to these relations in future need to be viewed against the backdrop of how the relationship between the two countries evolved over century and a half of British colonial rule.

A RECENT analysis on 'Managing Nepal's India Policy?' makes interesting reading.[1] Sadly, for its author, the breath-taking changes that have come over the political landscape in the Himalayan kingdom in the wake of the end of Panchayati raj and the holding of largely free, and fair, general elections (May 1991) under the multiple party system[2] have ushered in a major systemic restructuring of Kathmandu's policies, both at home and abroad. In the event, some of the assumptions on which the thesis rests would appear to have lost validity. And yet they are deserving of close scrutiny.

While reviewing a bunch of recent studies on Nepal a few years ago, the present writer drew attention to some important facets which may serve as a necessary backdrop to an understanding of Nepal's India's policy.[3] To start with, over the centuries, the country has maintained 'a cautious equidistance' between its two powerful, and populous, neighbours towards the north and in the south; its strategy for survival revolving largely around keeping that equidistance. Again, two major landmarks in Nepal's historical evolution over the past couple of hundred years and more have been the advent of Gurkha rule (1767) and the rise (c 1849) and fall (1950) of the Rana stranglehold. Finally, the 1960 coup of King Mahendra (r 1954-72) in dismissing a popularly elected government and the sharp deterioration of the economic situation in its wake. Followed by a well nigh complete turn around by his son and successor who, 30 years later, was made to opt for a return to democratic norms (April 1990). It would be interesting, as no doubt instructive, to relate these events to India's own record of managing its Nepal policy both under the Raj and, more importantly, in the decades since.

In the cluster of the three Himalayan states, Nepal occupies an important, nay almost pivotal, place. And this not only by reason of its size and population. For Sikkim is tiny by comparison and Bhutan, though larger in area, is yet small in numbers. More, of the three, Nepal's relations with Tibet and China were perhaps better defined and, in the Indian context, more relevant. Another factor may bear mention. The relatively small indigenous population of Lepchas in Sikkim and of the Bhotias in neighbouring Bhutan find themselves outnumbered, if not completely swamped, as in Sikkim, by the Gurkhas. Creating in their wake grave problems of ethnic imbalances that bid fair to threaten their fragile polities. And from which India's own north-east is not immune either—viz, the politics of Gorkhaland and of incorporating Nepali/Gorkhali as a separate language in the 8th schedule of the Constitution.

Hazy Beginnings

The Raj's relations with the Gurkha kingdom may be said to have their hazy beginnings at a time when the John Company was mounting a big effort to explore trade prospects in the north. This became especially urgent in the wake of a series of famines in Bengal in the last decades of the 18th century synchronising with the emergence of Prithvinarayan Shah as the undisputed master of the Himalayan kingdom. Nor was Nepal the sole quarry; British efforts were part of a larger design that embraced the missions of George Bogle and Samuel Turner to the neighbouring land of Tibet. That the company could not make much headway in either direction was not for want of trying.

Nepal's bout of hostilities with Tibet (1788-89) inflicted a veritable body blow on the latter and soon invited a war with China (1791-93). For the resurgent Gurkhas who for some time now had carried all before them, it was a humiliating reverse. The more galling in that Chinese armies had marched virtually unchecked to the outskirts of Kathmandu. Rebuffed in the north, the Gurkhas turned their depredations towards neighbouring Garhwal a[nd] Kumaon and in so doing came head- into conflict with the John Company t[hat] engaged in more or less simi[lar] operations—expanding and consolidati[ng] its dominion in the hills.

Happily, the first Anglo-Nepalese (1814-15) was also to prove the la[st.] Though worsted in battle, the Gurkhas demonstrated a fighting capability a[nd] power of resilience that won them t[he] enemy's respect, a fact amply demo[n]strated in the ensuing treaty of peace. F[or] barring some territorial acquisitions to saf[e]guard their position in the north, the Briti[sh] left Nepal more or less to its own device[s].

The immediate post-war political lan[d]scape in Kathmandu was one of unce[r]tainty and relative confusion—until t[he] emergence of the Ranas. Who from position of mere non-entities in the 183[0s] assumed an almost unchallenged hold ov[er] the apparatus of government by the 185[0s]. All the while their leader Jang Bahad[ur] graduated from the days of 'active host[il]ity' of Bhimsen Thapa to a position 'restricted intercourse' with, and 'friend[ly] isolation' towards, his powerful southe[rn] neighbour. A measure of his growing clo[ut] was the recall of the ever-nosey Briti[sh] resident, Brian Hodgson (1843), who outer facade of fostering trade and com[]merce concealed a determined bid to e[x]tend the British hold. The recall itself d[id] much to allay Jang Bahadur's mounti[ng] fears of British motives while happily f[or] him Hodgson's successor ruled that t[he] armed threat card had been over-playe[d]. For Gurkha military power, he confided [to] his political masters, was "an utter nullity".

By the time the two Shamshers, Bir a[nd] Chandra, emerged (1885), the Ranas h[ad] consolidated their hold over the land whi[le] the Ranas had consolidated their hold ov[er] the land while the British had come to re[ly] increasingly on Gurkha recruitment f[or] their armed forces. In the event, B[ir] Shamsher's visit to Calcutta (1893) t[o] meet governor general Lansdowne under[]lined the contours of the new relationshi[p]. The Raj promised a 'reasonable' supply [of] arms in return for an assurance that the[re] were no clandestine deals with other (Eu[]ropean) Powers and no arms exports t[o] Tibet. And while Kathmandu may no doub[t] have been disappointed in its expectatio[n] of 'one rifle for one Gurkha recruit', th[e] British broadly kept to their pledge of a[n] uninterrupted supply, conscious that th[e] Nepalese rulers could spoil their muc[h] valued Gurkha recruitment.

The opening years of the century sa[w] the British entangled in Tibet over wh[at] appeared a virtual non-issue. Ostensibl[y]

objective was to foster unhindered le with the land of the lama; in reality, was to pre-empt the Russians in their gedly nefarious designs on the coun- Characteristically, Whitehall seriously ated the possibility of using Nepal to e a proxy war Chandra Shamsher, ly too willing' to ingratiate himself, game. With Beijing in no position to rvene, he yearned for an opportunity eat the lamas and purloin some cov- l territory.

Treaty of 1923

vents leading to the 1923 treaty gnising Nepal's independence, "both rnal and external", underline the grow- importance the Raj attached to hmandu in its relations with the ai Lama and the government in Beijing. e, Charles Bell's mission to Lhasa 21-22) to help it with a modest supply rms and the Treaty of Rawalpindi 21) marking the end of British tutelage Kabul must be viewed as essential kdrops. Between Nepal and Tibet as a delicate balancing act, for any ly of arms to the Lama's government, eby adding to its strength, was anath- to Nepal's rulers who viewed their hbouring land as a veritable colony re they flaunted their extra-territorial ts and privileges. As to Beijing, the as had by 1912 dropped all pretence of nferior or subordinate status; the last quennial mission of tribute to the Son Heaven was despatched in 1908.

As one draws to the close of British rule in India, two points need to be heavily underlined. One, in mapping out the contours of their relations with the Gurkhas, the British had the advantage of dealing with a relatively stable, if notoriously regressive regime in Kathmandu. For the Rana oligarchy despite its internecine squabbles, managed to remain in the saddle, if partly because the Raj turned its face sternly against fishing in its troubled waters. As for itself, no sooner did it discover the excellent fighting qualities of the Gurkha soldier—in many ways a cut above John Tommy—than it was only took keen to make use of this great human resource to fight its battles. And not in the subcontinent alone, but in the remotest corners of the empire. More so in that they were mercenary soldiers who in return for their pittances remained steadfastly loyal to their masters.

In the bargain, the Raj lent a helping hand, within well-defined limits, in arming and equipping the Nepalese forces And perpetuating the Rana stranglehold. Nor did it fancy having an interest in breaching Kathmandu's sedulously guarded isolation. In the result, such international status as the country enjoyed in the wake of the Anglo-Nepalese treaty of 1923 was largely through the courtesy of Whitehall or its Indian adjunct. Nor was Kathmandu under the Ranas overly enamoured of the outer frills and trappings of a sovereign state.

Nothing much changed in the few decades that the Raj now endured. In 1933, the post of British Resident at Kathmandu, the nomenclature of which had already, in deference to Nepalese sensibilities, been changed was formally recognised as one of His Majesty's ministers while a Nepalese Legation in London obtained recognition as a juridically independent state. It was nonetheless 'a very special' treaty relationship for not only did Nepal supply a large contingent of regular troops to the Indian army but it was also dependent on India for an important part of its annual revenue in the shape of subsidy. More, barring a Nepalese representative at Lhasa, it had not established diplomatic relations with other Powers. The country was dependent for her trade on transit through India, receiving a refund of Indian customs duty on all imports (via India). The British were equally clear that the Gurkha source of recruitment must be maintained at all costs and that the Raj could not tolerate another less friendly regime south of the Himalayas.

In the Imperial pattern then obtaining, Nepal's position may bear comparison to that of Muscat in the Persian Gulf: a juridically independent state in treaty relations not only with Britain but also with other Powers and whose independence it was an essential British interest to defend. And over which therefore HMG was bound to maintain an unobtrusive guardianship.

It may be useful at this stage to recall the late Olaf Caroe's 'India and the Mongolian Fringe' which may be rated the Raj's swan song in terms of its definitive policy framework *vis-a-vis* the entire north-eastern frontier, *including* Nepal.[4] It was a 'Note' by India's then foreign secretary widely circulated for comment among officials in Assam and along the eastern frontiers—not a 'Memorandum to the British Foreign Office'. Again, the date it bore was January 18, 1940, *not* 1946.[5]

And finally, Olaf did not suggest, as has been averred, that the Himalayan states "should be integrated irrevocably with India through economic measures".[6] All that he did was to say that "the whole of this frontier and not only Tibet is regarded by China as irredenta". In the event, it was "an elementary precaution to take steps to fasten in the Indian orbit all that Mongolian fringe" from Nepal to the farthest tribal areas of Assam. How precisely was the fastening to be achieved remained undefined but, for the record, there is not a word on economic measures, much less on integrating the area irrevocably with India.

On Nepal, the 'Note' made two significant comments which may be of some contemporary relevance. One, "her [Nepal's] connection with China is often forgotten, but never by the Chinese". Two, the Nepalese are 'a philoprogenitive race' who had spread widely into Sikkim and Bhutan—and in Assam. This tendency towards expansion was "in different degrees feared and hated by other states". Above all, by the Tibetans who "dislike and fear" Nepalese encroachments.

Post-Raj Scenario

A word on the post-Raj scenario. On the morrow of Indian independence (1947), the Ranas, increasingly shaky at home, were keen to clinch a deal with New Delhi as a modicum of assurance against overt interference. India may have delayed matters—and, as a matter of fact, did—but its hands were forced by developments across the border in Tibet where the new Chinese communist regime threatened 'liberation'. To no one's surprise therefore, the 1950 treaty with Nepal was at best a holding operation resting squarely, with a few minor, almost cosmetic, modifications, on the earlier treaty of 1923. Not long after, a revolt in Kathmandu brought about by long-simmering discontent at home and overt, as well as covert, help from across the border spelt the doom of the long-decrepit Rana rule. Understand-

ably, the old monarchy, now restored to full authority, sought an assurance of New Delhi's goodwill.

Even as it did so, India's emphasis on its 'special relationship' with Kathmandu provoked hostile reactions and was anathema to the hypersensitive political elite in the Nepalese capital because of its presumed denigration of the country's national sovereignty. Independent, democratic India began to be viewed as a greater challenge than the alien if autocratic Raj it had replaced. In the event, King Mahendra's magic formula of "non-alignment with equal friendship for all" and "diversification" found, to start with at any rate, wide, popular acceptance. The idea was to effect a careful balancing so as to obtain greater freedom of manoeuvre and a cautious tacking back and forth between Nepal's two great neighbours as circumstances might necessitate. Despite its high-sounding rhetoric, this could best be a tactic, not a policy. And one with severe limitations on its utility.

Kathmandu's growing emphasis on its historical role as a link, a channel of communication, between the civilisations of south and east Asia was to underline its own independence. For New Delhi it was to be a non-aligned nation, not a compliant ally; its new stance helped by the glaring exposure of India's vulnerability, and weakness, in the 1962 border war with China. Not long thereafter, Nepal under King Birendra formulated its zone of peace proposal (1975) which, by implication, would take the country out of its security obligations with India and place its relations with New Delhi and Beijing on the same footing. With China's active support the proposal was pushed with such zeal that by 1990 it had been endorsed by as many as 115 nations.

Crisis in Relations

The recent crisis in Indo-Nepalese relations starting with New Delhi's decision not to renew the trade and transit treaties in March 1989 and its preference for a single treaty to replace the previous arrangement may be briefly reviewed. The 1978 treaties for trade and transit expired on March 23, 1989. Earlier, in 1950, 1960 and 1971, a single treaty had regulated both trade and transit and New Delhi now insisted that the former practice be revived. Its line of reasoning was unexceptional—if Kathmandu desired a special economic relationship, it would have to give way on a special security relationship. With the treaties expiring, New Delhi closed down 13 of its 15 transit points on the India-Nepal border, allowing the two at Raxaul and Jogbani to cater to essential goods. As a supplementary fuel agreement expired on the last day of March, Kathmandu faced a severe fuel as well as goods crunch. To no one's surprise it cried 'foul' and denounced the 'blockade'. New Delhi stoutly repudiated the charge, pointing out that the Nepalese had dilly-dallied on negotiations.

In the ensuing parleys, India maintained that trade could not be treated to the exclusion of other matters and suggested a comprehensive review of the entire gamut of relations between the two countries. All this while, non-renewal of the treaties choked major channels of communication and inflicted severe economic damage on the Himalayan kingdom. And in its wake precipitated a major political upheaval. For its part, Kathmandu presently discovered that however warm foreign sympathies and fervid aid commitments, they offered no panacea. Short-time palliatives at best, they spelt out no long-term solution. More to the point, China's much-touted enduring support notwithstanding, its real commitment to Nepal's economic sustenance remained as fragile and cautious as ever.

It has been argued that the Nepalese monarchy's pro-China stance was a result of its fundamentally autocratic character. Even the Ranas' reception of the 1950 treaty, a respectable Nepalese academic has suggested, was motivated in that it was "expected to provide a durable guarantee" to their shaky regime. Later King Mahendra's policies "supposed to have been guided by nationalism and far-sightedness" were, in reality, expedients" geared to serve only the ruler's interest". So also his zone of peace proposal which was a "bundle of contradictions" launched "without any homework". In sum, the monarchy was guided "more by short-term strategies of regime survival than by genuine national interest".[7]

More explicitly, both King Mahendra and later his son, King Birendra, were hostile to India and wanted to minimise Indian influence largely because they saw it as supportive of pro-democracy forces in the kingdom or, at the very least, those drawing inspiration from India. China for its part saw nothing objectionable in an autocratic regime and was more than willing to lend support, should it serve its specific foreign policy objectives *vis-a-vis* India. By stirring up hostile sentiments, a supposedly anti-India, pro-Chinese monarchy could divert its people's attention from their miserable economic plight and at the same time stall if not deny a democratisation of the country's political system.

A major irritant in Indo-Nepalese relations is said to have been New Delhi's umbrage on Chinese arms sales to Kathmandu of which the first instalment worth £ 20 million arrived in June 1988.[8] India viewed the deal with a measure of concern. A substantial military relationship between Beijing and Kathmandu, it must have argued, would upset the military status quo in the Himalayas. More, it was clearly violative of the letter and spirit of the 1950 treaty and the secret letters exchanged on the occasion. The latter clearly stipulating that "neither government shall tolerate any threat to the security of the other by a foreign aggressor. To deal with any such threat, the two governments shall co-ordinate measures".[9]

Specifically on the question of arms, in 1965 India had modified its 15-year earlier commitment to "agree to underwrite as far as possible the entire requirements of the Nepalese army". US and British assistance was to be sought only when New Delhi was "not in a position" to meet Kathmandu's requirements; such shortfalls, however, were to be "militarily co-ordinated" by New Delhi.[10]

Pro-Democracy Movement

A word on the pro-democracy movement launched in February 1990 and the repression unleashed to suppress it. Both in India and the world outside, the movement elicited widespread sympathy and support. Not unexpectedly, the king had sought an assurance of Chinese backing as he manoeuvred to a head-on collision with the massive opposition to his partyless panchayati raj regime. Sadly for him, Beijing's sympathies remained proforma; in the light of the fallout from its own holocaust at Tiananmen Square (June 1889) there could possibly have been no meaningful support to contain the upheaval in Kathmandu.

The interim government installed in April 1990, after the Maharaja's surrender to pro-democracy forces, was not unresponsive to Indian sensibilities. Nor was New Delhi for that matter wanting in reciprocity. Briefly, in less than four weeks—and on the eve of his visit to New Delhi—the new prime minister announced a postponement, and later cancellation, of the final consignment of Chinese munitions. A bare 10 per cent of the total purchase, it was slated for delivery in May 1990.

New Delhi for its part had clearly underlined that it was "not against" China or anyone else; only that it claimed a modicum of sensitivity to its security requirements. As it was, India's mounting concern with a whole range of Chinese activities—road-building, exchanges between military establishments, participation in sensitive development projects—had been ignored. Kathmandu backtracked only when Beijing's inability to act as an effective

counterweight stood starkly exposed. For when push came to shove, the Chinese discovered that they were unable to do much. An additional factor that must have weighted heavily in their calculations has been briefly alluded to, the Tiananmen Square massacre. For in its wake relations with the west deteriorated fast. Besides, Beijing had by now (1988-89) begun to mend its fences with New Delhi and, in the event, could hardly risk trouble.

India was not remiss in responding generously to friendly overtures. For during the Nepalese prime minister Koirala's visit (December 1991), New Delhi yielded to his pressure to de-link trade from transit. In the event, two, not one, separate treaties were concluded. In return, Kathmandu has adopted a more positive attitude in sharing water resources, promised not to buy arms from China and endorsed New Delhi's position on a nuclear weapons free zone in south Asia. Hopefully, SAARC should no longer be a forum for small countries to gang up against India.

The Indian prime minister Narasimha Rao's return visit to Kathmandu (October 1992) served only to reinforce New Delhi's friendly stance: simplification of the system for export of goods to India; increase in standby credit; liberalised guidelines for investment and co-operation in the field of water resources; an agreement on the modernisation of the Nepalese army.

Earlier, a goodwill visit of prime minister Koirala to Beijing (March 1992) would appear to confirm the shift in his country's policy. Overtly at any rate, the Chinese have taken no umbrage on Kathmandu's closer ties with New Delhi. The fact that India finds no mention, even by implication, in the joint communique at the end of the visit would, at its minimal, suggest an acceptance of the new turn in India-Nepal relations. If at all, Beijing's over-riding concern—as during Li Peng's visit to New Delhi (December 1991)—would appear to be a hyper-sensitivity on Tibet.[11]

One last word, Earlier diatribes against New Delhi's so-called "tunnel vision of security in the north" and Kathmandu's insistencethat "economic issues must be separated from issues raised by Nepal's geostrategic situation and Indian security sensitivities".[12] Or, its more recent formulation that bilateral relations "deserve to be reviewed" and an Indian "initiative" could alone "set a positive tone for better" ties in the future,[13] need to be viewed against the backdrop of how the relationship evolved over a century and a half of the Raj. Here too Olaf Caroe's 'Note' of 1940 comes handy. While recalling the "old spirit of active co-operation" that embraced economic as no doubt political relations, it underlined that "the independence of Nepal, if ever threatened, is a vital British interest". 'Tunnel vision, or otherwise, one half wonders if today, a little over half a century later, the earlier perspective or perception holds and is valid for the Raj's political legatees. Or has New Delhi's 'vital interest' ceased to be less vital or even less relevant?

Economics and the Indian Diaspora

Binod Khadria

Migration, Remittances and Capital Flows: The Indian Experience by Deepak Nayyar; Oxford University Press, Delhi, 1994; pp x + 134, Rs 220.

THIS new book by Deepak Nayyar is a refreshing break in the area of international migration. It focuses on workforce migration from India in the latter half of this century, building up a comprehensive profile of migration both of 'workers' to the oil-rich 'Middle East' (i e, west Asia) and of 'professionals' to the capital-rich industrialised countries of the west, mainly UK, Canada and the US. The book is remarkably insightful in its macro-economic analysis of the flow of financial resources which have been categorised as *remittances* (to families through banking channels) originating mainly from west Asia and *capital flows* (in the form of non-resident bank deposits in India) originating mainly from the industrialised west. Nayyar's study would be a valuable acquisition for researchers as well as policy-makers because of the topicality of not merely the west-based NRI interest in India but also the revived interest of the POI (i e, person or people of Indian origin) now living (and, in some cases, even ruling) in erstwhile colonies of the imperial era, e g, as reflected through the recent visit of the president of Guyana, Chedi Jagan, who himself would fall in that category.

Nayyar's presentation is neatly divided into six logically well-demarcated chapters: The Approach, Migration Flows, Financial Flows, Macro-Economic Impact, Policies and Problems, and Some Conclusions. Having set the framework of discussion in chapter 1 the author has tried to sketch a data profile of international migration from India in chapters 2 and 3. It is implied that such a profile has not been available so far. While the implication is probably valid in the case of financial flow data, many might question the proposition in the case of data about migration flows. But even so, what must certainly be granted is that it is nearly impossible to find a comparable compilation of data for UK, Canada and the US for recent years at one place and Nayyar's book supplies this need excellently till 1990-91. Of course, the author's credit is partly undermined, so to say, by the long gestation periods that characterise the output of all good publishing houses in India; otherwise the laurels would have been all his

Chapter 4, the core of the book, provides the macro-economic implications and consequences of the two flows—migration and financial—respectively in terms of the impact on output and employment on the one hand and on savings and investment on the other. In this chapter the overall impact on the balance of payments has been analysed in depth. Chapter 5 deals separately with policies of labour export, remittances and capital flows. Finally, chapter 6, concludes the book with a summary and a number of prescriptions for what the author calls "maximisation and the socialisation of benefits" (of migration) for economic development as contrasted to privatisation of benefits and socialisation of costs (of higher education) through migration On the whole, Nayyar's work is rich in terms of analysis as well as explanations. Some of his prescriptions, e g, like the setting up of a public sector corporation for short-duration labour exports (mainly to west Asia) to give competition to small unscrupulous private recruitment firms, or to phase out as quickly as possible the excessively expensive and at the same time unsecured dependence on NRI deposits for foreign exchange, etc—for the purpose of achieving the ultimate objective of 'socialisation of benefits'—deserve immediate attention of the policy-makers.

From a researcher's point of view, however, a few minor omissions and generalisations in the book would be noticed, and these could have been avoided For example, in chapter 2 the analysis misses out on the nuances of temporary migration to the US particularly (numbering at present in the range of 1,50,000 persons per annum as compared to 30,000 in the permanent category). While asserting that migration to the industrialised countries is made up almost entirely of permanent migration insofar as the proportion of emigrants who return to India after a limited period is almost negligible, the author could have specified that non-return is significant only in some categories, like students, temporary workers and trainees—the human-capital-endowed categories—but not all. In other categories, e g, exchange visitors or business visitors, he could have clarified that the phenomenon is numerically stable or permanent in the sense that the total numbers do not go down even if the actual persons involved change. These numbers naturally generate corresponding figures of remittances and capital flows to India. Sometimes these remittances from temporary migrants are large because the families are in India.

Similarly, from the socio-economic point of view, Nayyar's proposition that a large proportion of professionals, technical and qualified migrants would be at the upper end of the spectrum of incomes in India even before emigration perhaps needs to be qualified: They are relatively more from the upper end of the income groups when compared with those migrating to west Asia; otherwise they are more likely to have come from the middle spectrum of India's overall income distribution and there too some also on the lower side of the middle spectrum. What is of greater significance is that many such migrants have successfully lifted their respective families back in India from the clutches of deprivation once they were themselves well-settled in the west; and then by the time members of such a family migrated to join them later; the family looked like 'belonging' to the upper end of the spectrum of incomes. In this context, the author could have rather highlighted the irony of the fact that these migrants do largely belong to the upper-strata of degree-holders in India, i e, of the *human capital* distribution—which does not show a strong correlation with the distribution of personal or family incomes (or wealth) in India. In fact this is one micro-economic cause of brain drain from India.

The author's presumption that there is "no information whatever on professionals, such as engineers, doctors, architects, design engineers, bankers, teachers, chartered accountants, lawyers or management executives" in west Asia (p 29) is also not wholly accurate for all categories. Whereas for some categories of independent professions like for chartered accountants, lawyers or management executives the numbers themselves are negligibly small, information on doctors, engineers, architects, etc, is available for migrants from particular Indian states like Kerala. Moreover, in the case of Kerala particularly, even the author's other assertion about information being non-existent on return migration from the west Asia (p 33) is not well founded. It is only an unfortunate lack of interest of economists in general in India in international migration that probably explains why, apart from some other studies on migration, the published results of an important survey on migrants returning from the Arab world to Kerala—the state which sends half of total Indian migrants to west Asia—have remained largely unnoticed. Nayyar alone obviously cannot be blamed for such omissions. In fact, the author shows implicit awareness of the problem when he says, "The phenomenon of international labour migration has received far more attention from historians and sociologists than from the economists in the Indian context. The literature on the subject, in the sphere of economics, is limited in scope and narrow in focus" (p 3).

Keeping all this in mind, Nayyar should feel amply rewarded if the minor lacunae here and there of the study provoke some Indian economists sufficiently to look at the literature again. This apart, his effort would be doubly rewarded if other social scientists—historians and sociologists in turn—start to pick up some new facets of their interest in the overall macro perspective that this book helps so successfully to build. That would certainly further the cause of serious multi-disciplinary research in international migration.

Notions of Justice

S P Sathe

Law, Power and Justice by Vasudha Dhagamwar; Sage Publications, New Delhi, 1992; Rs 150, pp 392.

DHAGAMWAR's book recreates the environment of the early colonial period and the efforts of the colonial government to stabilise its rule over India. She gives a graphic description of how utilitarians like James Mill and Macaulay who accepted adult franchise in principle were opposed to a representative government for India; how they opposed colonisation in principle but justified Company rule in India. Mill was in favour of universal adult male suffrage (for men above 40) and against votes for women; on the other hand, Macaulay favoured votes for women but was against universal adult male suffrage (p 47). He favoured property qualifications. The author brings out the contradictions in the men who made law for British India during the initial years of colonial rule. This book on legal history is unlike other books on this subject by Indian authors. Instead of giving a chronology of events or of the Governors-General, it lays bare, very subtly, the interaction between the English lawmakers and the Indian society and the English people's perception of India. What was good for England was not necessarily considered good for India and vice versa. Dhagamwar's book tells the story of how law was made essentially to subserve power resulting in the denial of justice to the disadvantaged Indians such as the slaves, the lower castes and the women.

While the book very competently catches the ethos of colonial law-making and the perceptions which the law-makers had of India and the Indians, it does not deal with how Indians perceived the new law and the system. Colonial rule had doubtless provided space for social reformers who welcomed legal interventions for bringing about social change. These social reformers were opposed by the status quoists and a heated debate on the role of law, and particularly colonial law, *vis-a-vis* the Indian tradition was generated. The debates on the Consent Bill as well as on Rakhamabai's litigation are well known examples. The value of the book would have been enhanced if these aspects also had been covered. However, this omission does not reduce the research value of the book. What the author succeeds in doing is to project very articulately the attitudes reflecting the class and gender bias of the law-makers and the judges. She does this through an analysis of the writings in two leading English periodicals, namely, the *Edinburgh Review* and the *Westminster Review* and the judicial decisions of the early 20s and the 30s. She brings out that the patriarchal bias of the judges is to be seen not only in the judicial decisions of the 30s but also of the 70s. The Indian judges who still entertain the Blackstonian model of judicial neutrality would vehemently oppose any suggestion to be gender sensitive. They would say that they are not gender-biased and decide strictly according to the law. But the decisions given here clearly show how decisions 'according to the law' could be gender- and class-biased. The author examines generally the attitudes of the judges as well as the law-makers towards women. They expect rape victims to fight physically against their assailants and, simultaneously also remember each little detail of the act of rape. If the victim cannot evidence marks of physical injury resulting from resistance, she is disbelieved and if she wavers from her initial statement "even by a hair's breadth" (p 251) her testimony is discredited.

The book also deals with legal efforts to abolish slavery. The gender aspect of slavery has been very well brought out. The author shows how women are sold. The instances from Gwalior and analysis of *dharischa* documents show how the law in action varies from the normative law. The courts as well as the bureaucrats have taken a complacent attitude and termed these as matters of choice. This chapter draws exclusively upon a Marathi book written by leftist activist Godavari Parulekar *Jenva Manus Jaga Hoto*. In another chapter she analyses the experience regarding the dacoits in Chambal based on a book by her mother and famous Marathi writer-activist Geeta Sane. Here the author tells us how the higher castes, offended by the policy of egalitarianism, took to dacoity and how they were perceived as being legitimate not only by the people of their class but also by those who were to benefit by their marginalisation. One gets extremely enriching insights into the interaction of power, law and partisan notions of justice.

This book had already received recognition in academic circles in its first edition. The present edition is an improvement in content as well as in production. It would be of great use to all those who are interested in studying the interaction between law and society and particularly on the use of law as an instrument of social change.

Bonded by Blood: Matrilateral Kin in Tamil Kinship

Karin Kapadia

The steady fall in status of women in upwardly mobile groups in rural Tamil Nadu and growing anti-female bia in such 'progressive' groups that are benefiting from rural development, is closely linked to the change in marriag system, within these groups, from bride-price to dowry, which in turn has greatly weakened the importance of the matrilateral affinal kin in Tamil kinship. It is the matrilateral kin who to a large degree guaranteed a woman's securit and welfare and that their marginalisation is a major reason why women in upwardly mobile groups are increasingly at risk.

McGILVRAY, writing about matrilineal, non-brahmin Tamils in Batticaloa in Sri Lanka, observes that these Batticaloa Tamils are very different from south Indian Tamils because they have a matrilineal kinship system. He contrasts these matrilineal Tamils with "practically all of Tamil Nadu in south India... (which) is patrilineal in emphasis, giving greater salience to brahminical orthodoxy in ritual and belief" (1982b: 27). However, my data from Aruloor, a Tamil village in Tiruchi district in Tamil Nadu, suggests that McGilvray is, in fact, mistaken to assume that south Indian Tamils are entirely patrilineal in their kinship systems. On the contrary, my data is remarkably close to McGilvray's data in significant respects, suggesting that the importance of the matrilateral kin in Tamil kinship* has been greatly underestimated These kin have been the traditional focus of non-brahmin Tamil kinship in Aruloor. Further, traditionally affines tended to be from the matrilateral side of the family, and this largely accounted for the comparatively high status of non-brahmin Tamil women.

Today, however, Tamil marriage is changing quite radically [Kapadia 1990,1993]. Instead of the traditional emphasis on bridewealth marriage with close kin (in Aruloor particularly kin drawn from the matrilateral side), today the trend is in the direction of far less bridewealth marriage with close kin and far more 'dowry' marriage with 'strangers'. These changes reflect a far wider trend that is occurring all over south India [e g, Rao 1993, for south/central India]. I suggest that they are also correlated with a disturbing incidence of anti-female bias observed in upwardly mobile rural groups [Heyer 1992], because it is precisely in such groups that 'dowry' marriage has been most readily adopted.

Today in Tamil Nadu these changes are seriously undermining women's traditional status. I argue here that this is to a large part because 'dowry' marriage ignores, or, at the very least, devalues the traditional affinal link with a woman's matrilateral kin. A non-brahmin Tamil woman's matrilateral kin, especially her brothers, guaranteed her security and her status. 'Dowry' marriage is the exact reverse of the traditional form of marriage which was bridewealth (or brideprice) marriage. Here parents received a transfer of capital *from the groom's family* for giving them their daughter. Today, however, 'dowry' means that the flow of capital is in the opposite direction, *from the bride's family* to the groom's [Kapadia 1993 and forthcoming a]. The result, in Aruloor, is that a number of families are complaining, for the first time, that their daughters are financial liabilities.

It is because 'dowry' marriage is seen as high status marriage that it is being widely adopted by upwardly mobile groups. It is thus directly related to the *increasing economic differentiation* that is occurring within endogamous caste groups. Yet, as the following account shows, a married woman's matrilateral kin are traditionally held in high esteem, and her brothers—the 'maman'—are still very important. In this article I focus on discourses surrounding the traditional role of the mother's brother and the matrilateral kin. These discourses reveal the degree to which the security and status of married women depended on the support of their matrilateral kin and they provide a partial answer to the important question of why anti-female bias is increasing in Tamil Nadu today.

In this article, I focus on the kinship ideas of four non-brahmin castes and two brahmin castes in Aruloor, a village in Tiruchi district in Tamil Nadu. The four non-brahmin castes are: the 'untouchable' pallars, the upwardly mobile agriculturist muthurajahs, the 'untouchable' Roman Catholic paraiyars (popularly called 'Christian paraiyars' or 'CPs') and the wealthy vellan chettiars. The pallars are impoverished landless labourers. The muthurajahs are a striking example of an upwardly mobile group and are becoming economically differentiated with several families moving into salaried semi-urban jobs. The Christian paraiyars are falling back economically—they blame this on the loss of Church patronage. The chettiars are the richest landowners in Aruloor—they provide the role model for other non-brahmin castes in the village. The two brahmin cast are the Telugu brahmins and the Tam brahmins. There is still a general correlatic between caste and class in Aruloor thoug this is slowly changing.

Matrilateral Kin and Patrilineal Kin

In the following analysis, instead of fol lowing the convention of assuming a mal ego in the discussion of marriage prefer ences, I assume a female ego. I have don this not in order to make a feminist point bu because this was the perspective of m informants. They were primarily intereste in whom a girl ought to marry. Their as sumption was that marriage was far more important for a young woman than it was fo a young man As Sheryl Daliel points out: "a woman, traditionally, can have respect *only as a wife* . marriage is not a necessary precondition for respectability for a man as it is for a woman" [1980: 67; emphasis added]. Thus the question of the identity of the bridegroom was the central question. Did he belong to the kin on the mother's side, or the father's side?—this was the crucial question. To ask such question is to adopt the perspective of a female ego—and in doing this my informants, far from showing feminist tendencies, were, on the contrary, being true to their culture in giving central importance to the identity of the significant male. In the following discussion I therefore use the term 'matrilateral' as they did, in order to denote a female ego's marriage preference for a *groom from the mother's side* (mother's younger brother (MyB) or mother's brother's son (MBS)) and I use the term 'patrilateral' to denote the marriage choice of *a groom from the father's side* (father's sister's son).

For most informants the choice of a groom from the girl's mother's side (the young woman's real or classificatory MyB or MBS) was a choice that valorised relations with the matrilateral kin and strengthened the position and status of the girl's mother. A choice of groom from the young woman's father's side (her real or classificatory FZS) was, similarly, seen as a choice that strengthened her father's authority. This was explic-

y stated by the Telugu brahmins of Aruloor, so, like the Tamil brahmins, favoured such a 'patrilateral' preference. These Telugu brahmins expressed disapproval of the widespread non-brahmin Tamil preference for a woman's marriage with her MyB or her FZS because they saw this as weakening the authority of the patrilineage.

Because the four major non-brahmin castes of Aruloor all had a stated preference for grooms from the bride's mother's side, it was the matrilateral affinal kin who occupied centrestage in kinship in Aruloor. Further, because they were the most preferred affines, they dominated all life-cycle rituals and gave the most significant and expensive prestations (ritual gifts) at these events. It was their role as gift-givers *par excellence* that caused them to be so often described as the 'most important' relatives. This flattering phrase was used repeatedly by informants from all non-brahmin castes to distinguish marriageable matrilateral kin from the patrilineage (the 'pankali'). It is striking that even though inheritance rights and caste identity were transmitted in the male line (through the patrilineage), it was the affinal matrilateral kin who were spoken of more often. This view of the importance of affines derives from both the salience of marriage and life-cycle prestations and (as we will see) from the strong moral responsibility that rests with affines, especially the mother's brother.

Dumont's perceptive article 'Hierarchy and Marriage Alliance in South Indian Kinship' first published in 1957, gives some indication of why such importance should be given to affines. He said: "The most conspicuous feature of alliance. . consists in ceremonial gifts and functions... ceremonial gifts are essentially affinal..." ([1957] 1983: 79). Further, "this chain of gifts.. is the most important feature of marriage ceremonies" ([1957] 1983. 80). He emphasised that "*the affinal nature of the giving relationship* is demonstrated by the fact that almost all givers are only in-laws" ([1957] 1983: 94; emphasis added). He concluded that alliance was "opposed to kin " ('kin' or descent groups being opposed to 'alliance' or affinal relatives) but that, finally, it was "the principle of alliance" that was "the fundamental principle of south Indian kinship" ([1957] 1983: 103).

In short, the institution of marriage was central to the distinctive structure of 'Dravidian' kinship: repeated marriage with close kin is what Tamil kinship is about. Therefore, in Aruloor it was said that 'marriageable kin'—'kalyana murai'—were 'more important' in everyday life than lineage kin (pankali). The simple fact was that one got more from them than from patrilineal kin and for this reason one was more involved with them. There was a strong economic reason for the greater affection that one had for one's affinal kin.

However, there were also differences—though perhaps not fundamental ones—between the Kallar system that Dumont focused on and Tamil kinship in Aruloor. Kallar kinship united through 'alliance' clearly distinguished patrilineages, lineage identity being an important part of the Kallar person. But in Aruloor, with the non-brahmin castes the discursive stress was instead on the unity of the entire kindred and on the importance of 'sondam' or 'relationship' (or 'kinship'). In both Kallar and Aruloor discourses close cross-kin marriage was seen as reproducing the existing links of 'sondam'. But with Aruloor's non-brahmin Tamil castes the principle of descent was very weak. This weak stress on the male patrilineage—who controlled most wealth—was balanced by a strong emphasis on the affinal (matrilateral) kin who were characterised as the source of emotional and material support. So, as in Dumont's kinship paradigm, in Aruloor too the traditional non-brahmin kinship system was essentially bilateral in emphasis—but with a stronger stress on the matrilateral kin than Dumont's model.

Mother's Brother and Gift-Giving

The non-brahmin castes of Aruloor, in contrast to the brahmins, give the 'tay maman' the mother's eldest brother, the pre-eminent role in their kinship system. The MB represents the natal family of his sister (especially her parents) at ritual events but he also has great importance in his own right. This is for three reasons.

The first is his right to claim in marriage, either for himself or his sons, his ZDs (only his eZDs in his own case, but any ZDs for his sons) Good points out that the marriage of girls with their mother's younger brothers was a comparatively widespread custom (1980, 1991). This customary right ('urimai') traditionally afforded great influence to MB (and MBS) for if he did not claim them himself, he had a large say in deciding, jointly with the girls' parents, to whom they were to be given in marriage. So mother's brother's influence in the matter of his ZD's marriage had been important, though (in 1988) it was waning. It is through his urimai (customary right to marriage) that he can be described as 'inheriting' brides.

The second reason for MB's importance in Aruloor was derivative—it derived from the comparatively higher position of women in traditional non-brahmin culture than in traditional brahmin culture. Women were—and to a large extent, still are—highly valued in non-brahmin culture both as the producers of children and for their role as active participants in agricultural labour (both waged and unwaged). Thus, through his marriage claims, MB shared in the control of not only the fertility of his ZDs but also, in the Tamil lower castes, the bestowal of their labour. It is true that especially in the lower castes women are generally independent earners who are to some degree economically independent of their husbands [Mencher 1988]. However, even in these lower castes (such as the 'untouchable' pallars), both a woman's labour and her earnings are often seen as the 'property' of her husband [see Kapadia 1992].

The third reason is the effective link between mother's brother and his sister, and between him and his sister's children. As the following discussion will show, MB is believed to have immense affection ('pasam') for his sister's children. It is also widely believed that the link between brothers and sisters is exceptionally close and, significantly, endures throughout life, even after a sister's marriage. Margaret Trawick has discussed the remarkable intensity of brother-sister relationships more suggestively than anyone else. She rightly says: "In most of Tamil Nadu... the brother-sister tie is neither clearly severed at marriage, nor is its emotional priority over other ties translated into social priority. *The blood-bond remains, and is affectively the strongest bond...*" (1990: 179).

The rights of the mother's brothers were carefully balanced with responsibilities. They had the obligation to provide assistance to their sisters' husbands, whenever needed, and to provide important, expensive presentations at the life-cycle this of their sisters' children, both female and male They had to be present on these occasions and to give 'gifts', particularly at the grand puberty rites of their ZDs. In this traditional context, MB's gifts were quintessential non-brahmin gifts for they reflected the non-brahmin stress on reciprocity. Reciprocity was the dominant ideal of non-brahmin kinship: for everything given there was an equal or a greater return made. From this point of view MB's gifts were investments, made with the view of asserting and legitimising his claim to his ZDs. A MB who had not given ritual prestations and who had neglected his sister's children was not allowed to claim a ZD in marriage for his son or for himself: his neglect of his obligation (to provide gifts) resulted in his claims (and those of his sons) becoming invalid. Thus in Aruloor a clear *quid pro quo* existed: MBs earned their right to 'inherit' their ZDs.

A poor MB had to be provided with 'his' gifts by his sister and her husband. Rachel, a young woman of Christian paraiyar caste, stated: "If the maman is very poor, then the girl's parents might provide all the gifts necessary and only ask him to come to formally 'give' them". Malarkodi, a perceptive young woman of mutburajah caste gave the example of her FeB's daughter's child's ear-piercing: "Periappa's (FeB's) family are very poor and so their married daughter—whose husband owns a 'hotel' (cafeteria) in Jeyankondam—bought all the jewellery for the ear-piercing of her daughter (aged seven) and her son (aged five). Her younger brother (their MB), merely 'gave' it. This was known to everyone here—but in Jeyankondam they thought the younger brother had paid for it all!" This is what the

children's parents would have wanted people to think, because a poor maman brings discredit, while a rich maman brings honour. However, poor maman were also being summarily left out of the most important kinship event, namely, marriage—altogether. There was an increasing trend in Aruloor for wealthy parents to give their daughters in marriage to rich 'strangers' (non-kin of the same endogamous group) instead of giving them to the MyBs who had the traditional right (urimai) to marry them. This had happened in Middle Street, where Devaki, a Lingayat woman, from an upwardly mobile family, married her beautiful daughter to a wealthy bank officer, rather than to her younger brother, who was an impoverished farmer. Everybody in her street had noted this, but nobody explicitly criticised it—because the times were changing [Kapadia 1993].

An important aspect of MB's gifts is the fact that they are widely seen as constituting his sister's share of parental property. These presentations, known as 'sir', are presented by MB at all the life-cycle rites of his sister's children. This aspect of MB's gifts is implied by the term used for MB's gifts: they are termed sir which is the Tamil corruption of the Sanskrit 'stri'. This in turn is an abbreviation of 'stri dhanam' which means 'woman's wealth'. In Tamil this takes the form 'stiridanam' or, more usually its corruption 'sidanam'. Sidanam (or sir) is generally understood to mean the pre-mortem inheritance of a woman.

This is also how 'dowry' is understood in north India, Sharma states, but she argues, entirely convincingly, that this understanding is an ideological misrepresentation of reality because brides themselves do not gain any control of this dowry that is supposedly theirs (1984). However, non-brahmin women in Aruloor did seem to view sir as their share of parental property and so they became very indignant when their brothers did not provide sir, as they saw it as their right. Thus MB's 'gifts' to his sister's children were perceived as the rightful share of pre-mortem inheritance of his sister. From this perspective sir constituted an obligatory gift, and the MB who did not provide it was reneging on an unwritten contract. Dumont provides evidence for this view; he notes: "If ceremonial gifts are essentially affinal and if they are important, it should follow that, in societies with male predominance, *property is transmitted from one generation to the next under two forms:* by inheritance in the male line, *and also by gifts* to in-laws... This is precisely what happens... daughters have no formal share in their father's property, but they are entitled to maintenance and to the expenses necessary for their marriage and establishment... This double transmission of property confirms the opposition between kin and alliance" ([1957] 1983: 79-80; emphasis added).

I asked Paul, the influential Christian paraiyar municipal council member from St Xavier's Church street, if the sir given by MB really added up to an equal share in the property the brothers had inherited, as men liked to claim. He replied: "Yes, it does—the maman gives sir from the birth of the sister's children until the marriage of each child—and right until the death of the sister. So this sir usually adds up to more than the woman's share in property would have been. But men were becoming lax—reluctant to give sir to their sisters—so Indira Gandhi amma brought in a law which stated that from now on women have an equal share in inheritance. No, nobody actually gives any property to the girls. That hasn't happened. But because of this new law, men have got a fright and now they give their prestations much more carefully. They're afraid that their sisters might take them to court. If they do give the sir properly then everyone is satisfied—and the sister, being happy that her brothers are giving her generous sir, does not wish to quarrel with them, by demanding her right in property". Despite Paul's initial claim, however, his further words make it clear that women do *not* receive the equivalent of what their brothers inherit in landed property. If they did, brothers would have no reason to be 'afraid' of being taken to court.

Most women refrained from making any claims to family property, but in the Muthurajah street the case of Tilakambal was well known. Though in her 50s, the previous year (1987) she had sued her three brothers. They had given no sir to her children for many years. Tilakambal and her husband Ramasami (a retired railway clerk in his mid 60s) were among the few wealthy Muthurajahs in the street and had a house in Tiruchi city. Urbanised and shrewd, they knew that the new legislation gave them a very strong case. So when Tilakambal, using the new law, demanded her share of the family inheritance, she won her case (though she may have got less than she had hoped for) and was awarded half an acre of paddy-land. She and her husband now got an income of 20 'kalam' of paddy per crop. It was said by neighbours that the reason why Tilakambal's three brothers had not given any sir to any of her children was because of ill feelings between them and her husband from the very start. Ramasami had the reputation of being an aggressive man who was always fighting court cases.

Tilakambal's strategy was, then, not typical of muthurajah women, but was regarded as quite exceptional by her neighbours. One of them said: "No sister would ever go to court if her brothers were giving sir to her children. She'd much prefer the goodwill of her brothers to having wealth but not having them to give it. Of what use is just wealth? A woman's greatness lies in her having brothers who give sir to her children—'fame lies in maman giving sir in front of 10 others'."

A Christian paraiyar man complained: "Whenever a woman comes to her natal home she has to be given gifts to take back to her husband's!" This was true as far as women whose 'mother's houses' were in other villages were concerned. They visited their parental homes perhaps once a month on average, and as Malarkodi put it, "Something is always given: rice or (home-cooked) sweets—and sometimes new clothes." But it was obviously not true of those women who were locally married and who visited their mothers almost daily. Most people agreed that the sir that married daughters received amounted to only a tiny part of what their brothers inherited.

The obligatory nature of their gifts was as clear to the various MBs I spoke to, as it was to the sisters who awaited their prestations. In the wealthy chettiar caste, Devayanai Chettiar's younger brother Annamalai said: "Maman's 'seyu murai' (tradition of doing/giving) is a matter of duty ('kadamai'), not of mere desire ('ishta') or mere affection ('pasam'). He has to do it—even if he has to take out loans to do it. And if he doesn't, he'll be told off by others. I have to give to the children of Devayanai and Janaki. So far, because our parents are alive, they pay for the events, but I perform the role." This unsentimental, hard-headed view of MB's gifts being his bounden duty, because of his inheritance of parental property and his responsibility to assist his married sisters, was widely shared in Aruloor.

Women who had no brothers had a problem - "When looking for a bride for their son, people will generally avoid a girl who has no brothers. Because, with no brothers, who will give sir to her children? She'll have to always be chasing after 'cittappa's' son (FyBS) and 'periappa's' son (FeBS) to act as maman at 'necessary occasions' (life-cycle rites). And the bridegroom too won't be happy about getting such a girl, because she has no brother to give him the traditional 'maccman'-ring (ring from the WB). On whose lap will the child sit at the ear-piercing?—That's why girls who have no brothers aren't popular marriage choices." This was said by a muthurajah woman, but it was a view shared by all non-brahmins.

When I asked if only daughters were not more attractive because they inherited all their parents' wealth, I was told, by muthurajahs: "No one cares for wealth alone. Everyone considers honour ('madhippu') much more important than wealth. Everyone knows that there'll be problems with the maman-substitutes!" This had certainly been true in the case of Ambigai. She was a remarkably beautiful, young married woman, the only daughter of a rich muthurajah family. Her father owned two acres of farm land and also lent out money at interest. When her parents held the ear-piercing ritual of Ambigai's little daughters, they asked Ambigai's two FyB's sons to act as maman and hold the two-year old and one-year-old

on their laps. But Ambigai's classificatory brothers flatly refused to come, saying, "You didn't invite us for her wedding, so why should we come now?" They had not been invited to Ambigai's wedding due to an earlier quarrel between Ambigai's father and their father over the division of their inheritance between them (the classic 'pankali' quarrel between brothers). A delegation of several people went from the muthurajah street to the FyB's village to plead with them and eventually the young men were persuaded to come. Most persuasive of all was the promise that one of these young FyB's sons would certainly get half of Ambigai's inheritance one day. This was because she had no brother to light the funeral pyre of her father. Her own son could not light it because it had to be lit by a descendant in the direct male line. Instead, her father's elder brother's son or his younger brother's son would light the pyre. And whoever did so would get half the wealth of the deceased man. This is one area in which the importance of the patrilineal kin is stressed and consequently the matrilateral kin have to give way before patrilineal prerogative. the result is a much smaller inheritance for widows, their only daughters and their families. It is remarkable that this system has persisted among the muthurajahs, Christian paraiyars and pallars despite the importance of the matrilateral kin in these castes—and, not surprisingly, it was sometimes (though exceptionally) challenged by a doughty lower-caste widow who had her daughter light her husband's pyre rather than give away half the family inheritance to a patrilineal kinsman. This had happened recently among pallars in a nearby village.

Among the chettiars, the same course was followed when substitute MBs were needed. Palani Chettiar, their ritual leader, had stated: "If there is no maman, then only the classificatory maman will be asked to give the gifts. Patrilineal kin cannnot give these gifts." But, of course, given that it was often (among the chettiars as well) a woman's FBS who was chosen to play the role of MB, this was a case of the classificatory maman also being a patrilineal kinsman. As Dumont rightly pointed out, this interesting choice of a patrilineal kinsman to 'play' an affine was "an example of how an individual relationship is liable to a classificatory extension in agreement with the principle of descent" ([1957] 1983:90).

A classificatory MB was bound to provide sir if he had already been given a share of his classificatory sister's parental property—for instance, for lighting the funeral pyre of his 'sister's' father. If this was not the case, he could not be expected to provide any gifts unless he was indemnified in some other way. For this reason he was usually promised half the property that the [only] daughter was to inherit. In some cases [he] was made the heir to her parental home.

This had happened in the Pallar street, when Kannamma's husband died. Kannamma was elderly, with an only daughter. Her HyB's son had lit the pyre and had been duly promised half of Kannamma's property when she died, the other half going to her daughter. But the 'half' promised to the young man was in fact far more than half, it was Kannamma's home. Some of her neighbours thought she should leave the house to her daughter, but Kannamma refused. Her rationale was that in this way her daughter (who was of marriageable age) would be provided with a 'brother's home' (that is, the parental home normally inherited by the brother) to come to in case of marital difficulties. By accepting this arrangement Kannamma's husband's younger brother's son (who was her daughter's classificatory brother) both accepted the obligation to provide maman-sir for the eventual children of Kannamma's daughter, and the obligation to provide her with a home in the event of a separation or divorce.

Dumont notes that a MB must give presents to his Z's children and that these "are provided or compensated for by the fact that the sister had no formal share in the heritage, her share consisting precisely in such presents" ([1957] 1983:90). So the property a woman alienates to her classificatory brother (in order to persuade him to play the role of MB) is that property which her putative brothers would have inherited. Thus the notion of a property share is central to the obligation on MB to give gifts to his Z's children.

However, though the presentations of their brothers are regarded as women's traditional share in parental property, these presentations add up to far less than the value of the inheritance received by the brothers (on this point Sharma is quite right [1984]). This is because inherited immoveable property has traditionally been seen as a male right. Most women in Aruloor accepted this, stating that they did not expect or even want an equal share in property with their brothers. What they wanted was some share: the small part that was theirs through sir. They added that they were anxious not to alienate their brothers because, above all, they wanted MB's goodwill and solicitous concern for their children in the future.

Despite the willingness of most women to allow their brothers to receive their traditional inheritance without sharing it with them, a few women openly expressed doubts about these brothers. They were very few, but their dissenting voice said that MBs were not to be trusted. One of them was Siva (Sivagami, 'Siva' to her friends) my pallar friend and research assistant who lived in the Pallar street. She was young, educated to high-school level and city-born and bred. She had come to Aruloor from Tiruchi city at her marriage. She said: "Women usually try to have the ear-piercing ritual of their children while their parents are alive because they don't trust their brothers. After marriage their brothers will listen to their wives, who may dissuade them from giving sir." She spoke from bitter experience—her only brother, who was older than her, had never given her child any sir. This was because he had had a serious quarrel with his parents, when he married a Christian pallar woman in Tiruchi. So in March 1988, when Siva was planning a grand ear-piercing celebration for her young son, she and her husband were sure that her brother would refuse to participate, and thus deeply embarrass them. In the event, a fine ear-piercing was held, with many guests, in May 1988. To the guests it looked perfectly normal—for Siva's similing brother held her little boy as his ears were pierced and presented him with maman-sir. But Siva's close friends knew that this was a sham—her brother, though comparatively well off, had refused to spend a paisa on the event. All the gifts and jewellery had been purchased by Siva's parents and it had been only by abjectly pleading with him, that Siva and her husband had persuaded her brother to come at all.

In all the four non-brahmin castes a married woman was welcome to return to her natal home after marriage and in the three poorer castes she was expected to assist her natal kin with agricultural labour during the period of her stay. In the poorest castes (pallars and Christian paraiyars) young couples lived separately in nuclear families after marriage, but young married women always went back to their natal homes to provide labour on the family farms when labour-demand peaked (primarily at harvesting time but also occasionally for transplanting). When a married woman of a labouring caste returned home she was an economic asset to her natal family for she immediately added to the household income through her work. This was not the case with the brahmins. Brahmin women were not free to return to their parental homes whenver they wished after marriage. Thus the non-brahmin family's readiness to welcome a married daughter was closely connected with the fact that she, in her turn, provided them with free agricultural labour. This is consistent with the reciprocal ethos of non-brahmin kinship. So a central reason why lower-caste women even today continue to enjoy the strong support of their natal kin, is the fact that *they render valuable economic assistance, through their agricultural work.* Significantly, such support from natal kin has diwndled greatly for women in upwardly mobile groups, who have been withdrawn from agricultural labour.

MB's gifts or sir (maman sir as they are called) emphasise the *continuity* of kinship links between a non-brahmin woman and her natal kin. These do not weaken within a year or so of marriage as they do between a brahmin woman and her parents: on the contrary, every presentation from the married woman's brothers reaffirms this link, ex-

actly as every cross-kin marriage reaffirms *existing* kinship bonds. Non-brahmin kinship seeks to reproduce existing kin links rather than establish new links with strangers. In this orientation it is radically different from hypergamous north Indian kinship which normally does not repeat alliances [Tambiah 1973a: 93; 173b: 222; for exceptions to this pattern see Parry 1979].

Moral Authority of Matrilateral Kin

In discussing the relative importance of maman-maccinan (marriageable kin) and 'annan-tampi murai' (unmarriageable kin) a chettiar man explained the difference with deceptive simplicity. The former were more important than the latter, he declared, "because we can marry with them!" This simple answer, however, carries important implications, for affines are important not only because they 'are married' but also because they, rather than agnates, are perceived as providing the strongest moral and material support to their male affines. To quote Annamalai Chettiar in full: "Maman is so important because you can marry with his house—you can give and take spouses from his house. But you can't marry with your father's brothers' houses—therefore they aren't so important to you. Maman helps more and gives more to the family than cittappa (FyB) or periyappa (FeB). This is what he has to do—it is his 'kadamai' (duty)".

MB (maman) in his role as wife's brother (maccinan) is seen as far more likely to aid his sister's husband than that husband's own brothers are. I was repeatedly told that a man turns for assistance not to his own brothers (his 'pankali') but to his WBs (his maccinan). Further, from the accounts provided by informants a certain pattern emerged—all were tales told against the pankali who were characterised as greedy and unscrupulous—while the matrilateral affinal kins were elevated as moral exemplars, in one account to divine status. Here I provide three accounts of grasping pankali.

The first account was provided by Malarkodi (muthurajah): "Everyone says that the mother's side relatives are more important. This must be because the maman gives sir and helps the family. The cittappa-periyappa are supposed to be 'substitute fathers' and to help the family, but in fact they never are: they're only out to grab as much wealth as they can from us. On the 15th day after my father's death, my periyappa, Ratnam—with whom my father had had no quarrel—suddenly came to our house in the night and told us we must get out of the house and leave the village (Aruloor)—that we had no business to stay on here". In the ensuing quarrel with her husband's pankali kin over her husband's house, Malarkodi's mother (a very strong-willed woman) was able to resist being thrown out of her own house with her children. The pankali kin remained obdurate, telling her to go back to Thannirpali, where she came from. From that time on there were no relations between her husband's pankali (and her children). This was despite the fact that these pankali kin lived virtually next door.

The second account also came from the Muthurajah street and similarly concerned a widowed woman with children. Kannagi, whose children were quite young, was continually harassed by Ramasami, (Tilakambal's husband) who was her husband's eldest brother, and his two younger brothers. They wanted her to get out of her part of the house—and to go back to Kumbakonam (her 'mother's place') because they claimed, the official division of the house had not yet occurred. A very pleasant, forbearing woman, Kannagi had somehow managed to stay on in her house and to hang on to her share of land. She herself supervised agricultural labour on this land, eking out an income from farming.

Both these accounts focus on the death of a man and the vulnerability of his widowed wife and children, who are in danger of beig cheated out of their patrimony by devious pankali. This is likely to have been a familiar tale of everyday life in Aruloor, because in the third account these elements come together in a legend. It was told by Palani Chettiar, the knowledgeable religious leader of the chettiars. His story also vividly illustrated the importance of the MB, for in this tale, Siva (God) takes the shape of a maman to settle a family quarrel: "In a certain family, after the death of a man, his son didn't inherit his father's wealth because the boy's cittappa-periyappa grabbed it. So the boy's mother prayed to God, and Somasundaram (Siva), taking the form of a maman belonging to that family, appeared. He called each of the pankali relatives, addressing them by their names, so they thought he really was that maman. And he said sternly to them: 'Bring that boy's wealth here at once and present it to him with due respect—or else...!' And all of them immediately obeyed. That's why the maman is so important. It is he alone who is important for all events. Cittappa-periyappa are not as important".

This story illustrates the moral authority of MB—he is represented here as the arbiter of justice who protects the rights of his sister's children from their ever-grasping pankali. Indeed, in this account maman's importance could not be greater, for, in his moral qualities and his incarnation as protector of the oppressed, he is actually Siva himself. This 'apotheosis' of the MB is in fact regularly re-enacted in the life-cycle rites of his sisters' children, in which he participates, where he is honoured in what approaches a 'divine' manner.

Brahmins in Aruloor always invite their closest pankali kin to all their domestic celebrations and ceremonies. Significantly, non-brahmins Tamils do not. It is only affinal kin who are expected to be present and to give gifts, not patrilineal kin. This was put very clearly by a muthurajah informant: "Maman-maccinan kin comes for all our 'nalladu-kettadu' (auspicious and inauspicious occasions) and we go for theirs. They must be present—if they don't come it's an insult. But annan-tampi don't have to come, and usually aren't invited". Thus non-brahmin kinship has much to do with giving—because non-brahmin pankali kin don't give, they are not invited. This confirms what Dumont said when he stated that gift-giving was central to affinal alliance ([1957] 1983).

Concept of Blood-Bond

The prominence of the matrilateral kin is related to their importance as affines, but, in Aruloor, this structural position is also legitimised by a remarkable cultural construct, the concept of the 'blood-bond' ('iratta-sampantam'). This concept was central to how informants perceived relatedness. It was beguilingly simple and logical and was raised repeatedly by informants when they discussed kinship. Their exegeses can be paraphrased as follows: "You grow for 10 months in your mother's womb—it's her blood that nurtures you. So you *have more of your mother's blood than your father's blood in you*" (emphasis added). This had an unexpected result—that is, unexpected in my view, but self-evident in theirs—namely, that *a man (or woman) was consequently 'more related' to his MB than to his FB*. This was readily explained: "This is because maman (MB) shares mother's blood—and a child has more blood from his mother's side in him than from his father's side: that's why the boy is more closely related to maman than to citappa (FyB) the iratta-sampantam ('blood-bond') is stronger with maman".

These views are strikingly different from the views about 'blood' relationship reported by Barnett (1976) for the kontaikkatti vellalars in Tamil Nadu and by David (1973) for Jaffna Tamils [Kapadia 1993, forthcoming c]. They are, however, strikingly similar to the views of many matrilineal Batticaloa Tamils who told McGilvray that "the child's blood was definitely that of the mother" (1982a:53).

I should add that when confronted with the claim that MB was more closely related to a child than FyB, I naturally inquired as to the status of father: 'Is maman (MB) more closely related to a child than the child's father"? This question was treated with derision: "Of course not. Of course the child has more blood in common with his father than with his mother's brother. After all, he is his father's child too. But he has mainly his mother's blood. That's why he is less closely related to his cittappa (FyB) than to his maman (MB)".

One way to understand this extraordinary claim is to say that, of course, it was meant as a metaphor. But it was clear that some informants thought of MB's unique 'blood-bond' with his sister's children as being a

tual, physical connection. How did they reconcile this with their explicit (and repeated) statement that pankali kin were closer to them 'in blood' than affines—including MB? I suggest that by analysing the following conversation about MB, pankali and 'blood-bond' we may find some clues to how some people understood these relationships.

The speakers were Annamalai Chettiar (about 50 years old) and his younger sister Janaki (in her mid-forties):

Annamalai said: "Maman helps more and gives more to the family than do cittappa or periyappa. When the property is divided between brothers, in the formal document of division this phrase recurs: 'having divided the wealth between us there is no other connection (sambandam) left between us other than the iratta sambandam (blood-bond)'. This is explicitly stated. But maman's connection with us never ends."

Here his sister Janaki took over: 'You *can* say that maman has greater iratta sambandam (with his sister's children) than cittappa-periyappa—firstly because maman is connected with mother who has greater iratta sambandam (blood-bond) with the child than does the father. Further, maman has the 'kalyana urimai' (marriage right) with the children. Next, maman has 'pasam' (affection) for the child—which cittappa-periyappa don't necessarily have. And maman has the kadamai (duty) to act on behalf of and to give to the children. For all these reasons his connection with them is much greater."

Here we are given a variety of reasons why MB is 'closer to his sister's child. Firstly, as Annamalai points out, while MB is constantly at hand to help, FBs take their share of inheritance and then, despite their blood-connection, call it quits. One can expect little assistance or sympathy from them—there are 'always' long lasting quarrels between brothers after the division of the inheritance. But in contrast to the pankali, MB (in Janaki's argument) remains connected with his sister's children through his blood-connection (through their mother), through his genuine affection for them, through his duty and obligation to provide for them—and through his self interest, embodied in his and his sons' marriage rights. In this discourse, maman emerges as the very opposite of the pankali—while they represent grasping self-interest and a constant danger to the interests of their brother's children, maman emerges as the protector of these interests—as indeed he does in the mythic tale cited by Palani Chettiar. In a culture where 'blood' is probably the dominant metaphor of 'connectedness' it is, then, no surprise at all that MB is categorically stated to be 'closer *in blood*' to a child than its FBs. The cultural logic is flawless. Discussions of 'difference in blood' and marriage-partners belong to a quite separate sphere of logic.

Further, the sociological context of the argument is crucial because it is its context that validates the argument. To the chettiars it was self-evident that MB had an extraordinarily close relationship with his sister's children—far closer than that of any FB—for the simple reason that MB lived in the same house with his sister's children—at least during the day. This family situation arose because among the vellan chettiars married daughters spent more time daily in their natal home than they did in their marital home. Devayanai Chettiar explained why.

I had noticed that her two daughters' young children were very much attached to her—they spent much more time at home with her than they did in their father's house. When I asked about this, she replied: "This is quite usual, actually—children are more with their mother's mothers (MMs), so they grow more attached to them." This was particularly the case with the vellan chettiars, among whom a bride customarily continued to bathe daily at her mother's house for at least a year after marriage. In many cases, even after several years of marriage, young chettiar wives continued to bathe at their mother's home and to spend most of the day there. They did the cooking at their marital home and ate with the marital family (and in-laws) and returned there to sleep at night. But apart from this they—and their children—spent the entire day with their mothers.

In Aruloor this custom was unique to the chettiars, who explained it as due to their extraordinarily localised marriage—most girls were married to men living in the next street. As Devayanai said: "This practice probably started because we all live in one place—Aruloor. Just a few of us live in Lalgudi."

But, even in the other non-brahmin castes, the same sentiment was voiced; Malarkodi of the muthurajah street commented: "Yes, children are generally far more attached to their MMs". The fact that cross-kin marriage is very often, local marriage is probably the main reason for the general closeness between a woman's parents, her brothers and her children. In all four non-brahmin castes there were many married women living only a few doors away from their mothers.

So the fact that 'amma vittu' (mother's house) has traditionally been very close-by, has had an important role in cementing the affection of MB for his sister's children. Significantly, only the brahmins used the term 'father's house', when they spoke of a woman's parental home. All the non-brahmin castes used only one term to refer to this parental home—and it was 'amma vittu', mother's house.

Mother's Brother, Astrology and Divination at Childbirth

Striking evidence of the very special connection that exists between maman and his sister's children is found in the astrological beliefs and practices of all four non-brahmin castes. Maman's central importance in these rites strongly contrasts with the marginality or absence of cittappa-periyappa (FyB-FeB) in these astrological discourses.

Most remarkable of all is the manner in which the horoscope of a child, either female or male, "says more about the house of maman" that it does about the fortunes of FyBs or FeBs. Significant differences existed between the castes: in the chettiar caste, Devayanai Chettiar said: "The eldest son's horoscope speaks about his house and about his maman's house. It says nothing about the houses of his cittappa-periyappa". But later her younger brother, Annamalai, amended this: "Yes, my 'jadakam' (horoscope), as eldest son, 'speaks' a lot about my maman's house—but very little about my cittappa-periyappa. It does mention them, though." Janaki, Devayanai Chettiar's younger sister added: "More is said (in the horoscope) about maman because he is the tay-maman (MeB), born with mother—and so very important."

Maman is central to another non-brahmin divinatory practice: when a child is born the position of the umbilical cord augurs good or ill fortune, especially for MB. So the chettiars said: "If the child's umbilical cord is twisted round its neck this is 'bad' (dangerous, inauspicious) for maman." Such a birth is described as one where the baby is 'born circled by a garland' ('malai-sutti pirandal'). It is important to note here that both at the puberty rite and at marriage a ZD is garlanded (and thus 'circled by a garland') by MB (just prior to her being wedded to the groom). This suggests that the divinatory practice has some connection with the fact that MB can marry his eZD. A male infant 'garlanded' in this way also presages bad luck for his maman. Further, the chettiars said, "If the cord is twisted around the waist of the new-born (like a belt) then this is 'bad' for the cittappa periyappa." So the chettiar practice does mention FBs as well. The muthurajah caste shared the belief that a 'garlanded' new-born signalled bad luck for MB, but it had no such beliefs concerning FBs. They did not figure in birth-divination. To understand why we must remember that the chettiars were wealthier than any other Aruloor caste and also prided themselves on being more brahminical in behaviour. For these reasons, they took a greater interest in the patrilineage—even though they were strongly focused on their matrilateral affines. It is this greater interest in agnates that is mirrored in their divinatory practices, which consequently do not entirely ignore the FBs as those of the muthurajahs do.

To dissolve the inauspiciousness of a 'garlanded' birth so that MB's future is safe, chettiars perform an additional rite at the 'punniya danam' (purification) of the baby and its mother, which takes place soon after birth. The MB is not allowed to see the baby until then. At this purification rite MB is seated. Then auspicious gingelli oil ('nallenney') is poured into a broad-mouthed

vessel or a tray. This is held in front of MB. Bending down, MB should 'see his face' ('mokatte pakkanum') reflected in the oil. Then the baby is brought and held above the head of MB (who is still looking down at his reflection) so that the baby's face too is reflected in the oil. In this way the baby's face is first beheld by its MB in the auspicious oil. After this the danger to MB is held to have passed away. Exactly the same rite was performed by chettiars to remove inauspiciousness for FBs. The rite was called "removing the (astrological) flaw" ('dosham kalikkiradu') or to do a pacification/purification rite" ('parikaram seyyanum') [for a discussion of dosham see Kapadia forthcoming b].

A muthurajah friend described such a muthurajah purification rite. She said: "You can see the reflections very clearly. My periyappa's daughter Banumathi had such a baby (Santhi). At the punniya danam her face was shown to her tay-maman, Arokiaraj. Arokiaraj was only three years old. It had been thought that he would marry his eZD (Santhi) but this idea was dropped when the cord was found around her neck. This indicates very bad luck (inauspiciousness, 'kettadu')."

Palani Chettiar, on the contrary, said that among chettiars such a 'garlanded' baby girl could marry her maman, after 'seeing his face in oil'. The fact that the muthurajahs absolutely forbade this makes the chettiar custom appear almost foolhardy. However, in allowing such a marriage, despite the bad auguries, the vellan chettiars were bowing to necessity. They were a very small, endogamous community, with a remarkably high rate of actual MB marriage. In such a marriage context, with few alternative marriage partners available to them, it was unlikely that they would wish to further decrease their already limited pool of marriageable men.

Conclusion

In this discussion I have argued that data from Aruloor suggests that the bilateral elements in non-brahmin kinship are far more significant than have been allowed by the Dumontean model [Dumont 1953; 1957; 1983]. These bilateral elements clearly make the kinship system of Aruloor similar in signifcant respects to the Sinhalese and Sri Lankan Tamil systems [Yalman 1962; 1967; McGilvray 1982a; 1982b].

Further, as McGilvray suggested (1982b:27), it is indeed the case that where patrilineal principles are weak brahminical beliefs are marginal or irrelevant. Evidence for this correlation exists in various aspects of non-brahmin culture, such as the prominence and lavish celebration of female puberty rites and the importance of the menstruation horoscope [Kapadia forthcoming b]. Neither this horoscope nor female puberty rites are given much importance by the brahmins.

More disturbingly, the same correlation appears today in the move to dowry marriage. Dowry marriage is perceived as the quintessential brahminical marriage and in its modern form of 'marriage with strangers' in Tamil Nadu it has a strong hypergamous element. It makes the bride's family subordinate to the groom's kin, drastically weakening the young woman's position from the outset. In rural areas like Aruloor, *dowry marriage is especially practised by those groups who are benefiting from rural development* and whose status is rising. They see dowry marriage as high-status marriage and are therefore keen to make it part of their symbolic capital. It is precisely in these 'progressive' rural groups that important recent research in Tamil Nadu has found a remarkable anti-female bias [Heyer 1992]. Heyer concludes her study thus.

> What is particularly disturbing about this case is (1) that high dowries are a relatively recent and increasing phenomenon, and (2) that it involves a south Indian community that is unusually 'progressive'. It would need much more work to establish a connection between the development of the agrarian economy in this context and increasing discrimination against female children. But there is enough to suggest that there may be an association (1992:435).

In short, four crucial factors appear to be correlated in Tamil Nadu today. They are: (1) increasing economic differentiation within endogamous caste groups; (2) a steady increase in dowry marriage and a corresponding rejection of close-kin marriage; (3) increasing anti-female bias in upwardly mobile groups, and (4) a steady fall in the status of the matrilateral kin. Urgent research is needed to determine the effects that agrarian change is having on women's security and status. Until today it was a woman's matrilateral kin who guaranteed this status and security. Today this is no longer the case: rural Tamil women are at risk and their status is falling. Ironically, this is happening in the very groups whose social status is rising.

Notes

[Fieldwork was carried out in Aruloor in Lalgudi Taluk, Tiruchi district, Tamil Nadu, from January 1987 to May 1988 with further visits in December 1988, December 1990 and January 1991. Aruloor is a pseudonym.

I am particularly grateful to Chris Fuller and Jonathan Parry of the London School of Economics and to Anthony Good of Edinburgh University for comments on this material. I also thank Francis Jayapathy, also of the LSE.]

* In this article the following kinship notation is used: F: father, M: mother, B: brother, Z: sister, S: son, D: daughter, H: husband, W: wife, e: elder, y: younger. These standard abbreviations are used here to denote *both* genealogical relationships and classificatory relationships.

Agrarian Transformation and Co-operatives

Continuity and Change

Vikash N Pandey

The limitations/failure of land reform lay the structural foundations of the limitations/failure of rural co-operatives and the Green Revolution. Wherever land reforms have failed (at least in removing the non-cultivating groups and establishing the cultivating owners), the groups which need co-operatives did not emerge. Similarly, agricultural transformation has remained elusive in those areas.

MOST of the literature on agricultural transformation in India attempts to understand the success and failure of land reforms, co-operatives and the Green Revolution in their ability to transform Indian agriculture in a compartmentalised manner. This paper attempts to make a departure from this ahistorical mode of enquiry and argues that agricultural transformation, the nature of land reform and the emergence and working of Primary Agricultural Co-operative Societies (PACS) are closely linked with each other and with the adoption of the Green Revolution package. All three together (land reforms, co-operatives and the package of Green Revolution), in many ways, inform the content and context of each other. Historically, PACS' working has been really related to bridging the gap between land reform and Green Revolution by providing the institutional back-up. In this societal discourse interests were articulated in the organisational forms of the co-operatives and the co-operatives, in turn, provided the articulation of a particular stream of interests. Thereby the paper puts forth the hypothesis that the nature of land reforms, in general, provides the structural foundations of the character and limitations/failure of the PACS and subsequent growth in agriculture.

I

Land Reforms and Co-operatives

The agrarian structure in colonial India was an admixture of feudal relations of productions and hybrid bourgeois property right on land. The landed property during colonial era was based on two contradictory principles: individual private property and recognition of ascriptive (non-economic) privileges/status. It not only sustained different layers of rights in land but in a variety of ways also countered the absolute right in land especially for the middle layers of proprietors. At the same time, as the privileges of the pre-British period were maintained and protected, these became the basis of proprietary right or occupancy right in land [Pandey 1989b]. It led to the corresponding pre-capitalist character of the proprietary class and the privileged tenants with occupancy rights. The noticeable point is: the surplus from land belonged to those who did not cultivate the land. There existed a negative relationship between ownership and cultivation on the one hand and maintaining a variety of middle layers of ownership rights on land on the other. Those who had the ability were not interested in production but only in rent extraction and those who were actually cultivating land had neither the right nor ability/incentive to invest in land [Pandey 1989a.21].

Thus, during early 20th century there was a silent change in the composition of cultivator-cum-landowning (not the landlords but hereditary cultivators) groups: emergence of peasant castes more pronounced in Gujarat, Punjab, western UP, parts of AP and Tamil Nadu and subsequently in Bengal, Bihar, eastern UP and Telangana region of Andhra Pradesh. In this interplay the middle layer of agrarian order comprised high caste intermediaries and their descendants and the dominant peasant castes [Pandey 1990:2607]. At the same time, the development of irrigation facilities and cultivation of commercial crops has been taking place since the late 19th century as subsistence agriculture had started providing space to market-based production under the aegis of 'colonial modernisation' and the resultant change in agriculture. Secondly, the development in commercial farming was not, however, matched by any corresponding growth in agricultural support systems. Consequently, cultivators had to depend almost entirely on moneylenders, traders, merchants and businessmen who controlled the markets for the sale of their produce. Local retailers, agents and village 'sahukars' were securing the produce from the cultivators, and thus managed to have a share in the profits of agricultural marketing.

However, this dynamics implied the contradictions and conflicts between sarkar, sahukar and zamindar (on the one side) and the subordinate proprietors as well as peasantry at large (on the other). The conflict was over the maintenance of respective privileged positions and a share of surplus from land. These conflicts could be contained within the legal framework (battle within the court-room) once the state accorded legitimacy to the claims of the middle layer. In this process, the middle layer was the upholders of 'rule of property' and 'rule of law' [Pandey 1990. 2608]. For them, the property represented a natural right and liberty to individuals. Being antagonistic to zamindars' rights over their own positions, they as a class became the backbone of the national movement which called for doing away the sarkar, sahukar and zamindar raj and at the same time preserving the institution of private property. This ambiguous position was the basis on which the middle category joined the anti-feudal struggle of the popular masses and withdrew when the sustained struggle could have led to erosion in their own positions [Dhanagare 1983; Pandey 1978; Hardiman 1981]. Such a class alliance was the core of the national movement and various peasant movements in their emergence and closure as was evident in their agrarian charter.[1] The peasant insurrections in first half of 20th century across the regions of India are an intensively studied phenomenon. These peasant struggles led to land reforms and legislations that produced "some perceptible change" in the agrarian social structure in India [Thorner 1976.41 42].

The objective of the land reform measures in the main was to remove some of the vestiges of an outmoded order which had so long hampered progress and to allow land ownership to go into the hands of cultivators. For the most part, these measures content themselves with freeing the agrarian structure of one superfluous layer of jagirdars and zamindars. This layer had clearly lost organic connection with the production service of any kind and whose loss, therefore, was demanded by the various layers of peasantry not only for better production possibilities but also

for better control on the resources and conditions of life.

Evidence suggests that the effect of land policy has been in the direction of (i) reduction of power in the hands of jagirdars and zamindars, (ii) the emergence of a new managerial class of agriculturists, (iii) general failure to make tenants-at-will own their holdings and be spared rent payments [Khusro 1958:84] The findings of inquiries on land reforms and various studies conducted subsequently corroborate the above observations

These measures have broadened the base of the prosperous proprietary class compared to what prevailed during the British period, by cutting to size the landholdings of the landlords and thereby extending the base of proprietary class comprised of landlords, rich farmers and middle peasantry. These new strata are provided various incentives to take active interest in agricultural production and augment production through subsequent measures On the other hand, the measures have left large sections of the small peasants, poorer tenants and landless labourers deprived of their due shares in agrarian production and benefits [2]

Along with land reform came the co-operatives. The Rural Credit Inquiry Survey of 1953-54 revealed predominant nature of informal credit in the total borrowings of peasants. Co-operative credit was seen to be an answer for provision of credit to the farmers [Bouman 1989:11-19] The state launched these co-operatives primarily for credit operations. Thereafter, the linking of credit with processing and marketing became a dominant theme in the early 50s and 60s and many of the co operatives started getting engaged in such operations Subsequently, with the 'Grow More' agenda, the extension of modern inputs like fertilisers, machine tools, etc, was to be tied up with credit if the (1) farmers were to be encouraged to adopt these measures, and (2) farmers with limited capital base were to acquire these inputs as well as meet running expenditure. The nature of this strategy and operations led to a series of changes in the structures, procedures as well as emergence of co-operative societies engaged not only primarily in credit operations but also in providing input supplies and output marketing facilities to the members. "The establishment of National Co-operative Development Corporation (NCDC) and the large proliferation of the training, manpower development and funding infrastructure under its umbrella was accompanied by rapid up surge of co-operatives engaged in procurement, processing and marketing of other commodities such as paddy, sugarcane, cotton etc... Practically all these co operatives in commodity processing and marketing in addition to credit service received contributions from state government in the form of capital and loans as well as subsidies and grants either routed through NCDC or through the state level co-operative bodies of different kind" [Phansalkar 1991:5-6].

In general co-operatives were seen as an organisational network to reorient agriculture after land reform as it was visualised that in the absence of such organised mechanism, the beneficiaries of land reforms, i e, especially medium and small farmers, will succumb to the remnants of many classical features of underdevelopment as well as inter locked markets. If land reform was to remove feudal landlords and transfer land to cultivators (especially those who were in the range of middle and small landholding categories), the farmers as individuals would face severe constraints in the open market. Compulsions of the farmers related to input purchase to make production possible and better production as well as to meet the recurring expenditure and at the end of the agricultural season to get reasonable and quick returns for their produce make it possible for the moneylender and trader nexus to have certain advantages over individual farmers. Their sustained advantages could restart the cycle of loan-indebtedness-land alienation-pauperisation-greater indebtedness. The PACS, to start with as credit co-operatives, were to provide the institutional back-up to land reforms by providing cheap credit to the farmers. It, thereby, would save the newly acquired property rights over land from slipping into the hands of rich gentry and moneylenders. Societies providing integrated services to the farmers (finance, production, marketing, consumer and welfare) were created with the following objectives (1) providing credit for agricultural operations to its members to make the investment in agriculture possible and subsequently increase in production and (2) by providing marketing services to the members, ensure better return and better quality of life to its members. As of today, the main activities of these PACS are related to providing (a) loan for productive purposes, (b) production inputs like fertilisers and seeds, (c) production tools to aid production, and (d) purchase and marketing of farmers' produce (all these to decrease production cost and increase income).

It is of relevance here to see the exact nature of land reforms and co-operatives under 'mixed economy' which are quite distinct from collective/communal ownership, farming and distribution. In the Indian context, both were, conceptually and operationally, based on the idea of private property and protection offered under the agenda of 'freedom to individual'. Therefore, the functions of land reforms and co-operatives, in this context, was to provide the farmers landed property and then protecting them from interlocked market and enabling them to participate successfully in the market economy

This happened under the aegis of the welfare state guided by the democratic socialism paradigm. Therefore, the character of the Indian state in particular and Indian democracy in general become central to the formulation and implementation of land reform (by and for whom) in its proclaimed and covert objectives and the subsequent changes in the co-operative movement as well as strategy of agricultural modernisation It was the hybrid coalition of rich peasants, emerging intermediary peasant castes, small holders and agricultural labour as the clientele of 'welfare state' and 'democratic socialism' which embarked on land reform under the slogan of 'land to the tiller' But the existence of prosperous or prospering middle and upper peasantry left no way the state could ever act against their fundamental interests [for detailed discussion on this point see Kaviraj 1988, Bardhan 1984; Prasad 1989]. The core of the hybrid coalition, the ruling elite[3] (the rich and middle peasants, intermediary peasants castes) shaped the real policy into legislations and practice. Suffice to say here

TABLE 1: AREA OWNED BY MEMBERS—FARMERS

(Acres)

Villages	Small Farmers		Big/Medium Farmers		Total		Grand Total

Notes: 1 A4 and A6: farmers have land in the uninhabited village, therefore, figures of A4 and A6 include the land of the uninhabited one.

2 A5, A6, A7 and partly A4 are having rainfed agriculture. A3 and A8 are at the tail end of the command area of the canal.

that the policies, measures and programmes undertaken subsequently were subject to this dynamics.

The process seems to reflect the state-ruling elite alliance and continuum. In other words, agrarian transformation was defined and characterised by this discourse where the interests were articulated in the institutional forms and the institutional forms, in turn, provided/facilitated the articulation of a particular stream of interests.[4]

Till now I have summarised the ideology and its linkages with the agrarian structure (in a way the categories of farmers forming the backbone of the ideologies) during the first phase of agricultural change, i e, land reform and the co-operatives. This phase was based on agricultural growth through egalitarian distribution of resources in the hands of cultivators because before that there was a negative relationship between ownership and control over surplus on the one hand and actual cultivation on the other. The second phase of agricultural transformation was entirely based on the productivity issue and the package was of the Green Revolution. The abject failure on the food front and the increasing dependence on other nations for food imports brought a shift in the agrarian strategy of the state in India. The emphasis shifted from institutional change to technological innovations and adoptions. This new approach has been articulated since the 60s. However, the co-operatives, as noted above, again became the organisational network for the extension of this possibility, for example, part of credit as kind loan in form of input supply, especially fertiliser and pesticides

Having explained the basic foundation of the agrarian transformation in general and the place of PACS in it, now I turn to certain observations about two PACS in Nizamabad district of Telangana region of Andhra Pradesh (the names of the PACS and the villages are not disclosed).

II

PACS in Telangana Region

Society 'A' was established in 1954, with the main object to provide short- and medium-term loans to its members for their agricultural operations and to arrange funds from the District Co-operative Central Bank, commercial banks and other organisations to its members. In 1957, with the commencement of the Second Five-Year Plan, it was decided to merge some village level societies and establish large sized societies as small ones were unviable. The new large sized co-operative society was registered in 1957, merging three credit societies operating in three villages. Later on two more credit societies were merged with this society leading to expansion in the area of operation to 11 villages since 1977. Out of 11, ten villages are inhabited and one is uninhabited. The 11 villages are scattered within a radius of 10 kms from the headquarter. The area of operation of the society is 70.36 sq km.

The society's membership has increased from 20 (1954) to 1,995 in 1990. The society now covers 4,540 agricultural families and 10,500 acres of cultivated land. The main crops raised in its area of operation are paddy, groundnut, jowar, chillies, sunflower, sugarcane, etc. During 1980-81, food crops accounted for 94.9 per cent of the cropped area. Area covered under paddy has steadily gone up after 1984-85 when a sub-distributary of Nizamsagar canal brought water to these villages. However, this sub-distributary does not cover two villages and another two villages are at its tailend. Nearly 30 per cent of cultivated land in the area is wetland, and around half of the wetland is under double crop.[5]

The total population in the area of operation of the society is 17,222 (as per 1981 census) which constitutes 38.26 per cent of the total population of the mandal. There are 2,508 (14.56 per cent) scheduled caste persons and 866 (5.03 per cent) scheduled tribe persons. Literacy rate of the population is 19.26 per cent (total 3,317). The literacy rate in the area of the operation of the society is lower compared to that of the district (21.73 per cent). The total working population in the area of operation is 8,456 of which 18.98 per cent are agriculturalists, 62.2 per cent agricultural labourers, 2.37 per cent village artisans, the rest being 1.13 per cent. The area typically represents the landholding pattern in Telangana region (through being part of one of the agriculturally developed district of the region) where small and marginal farmers comprised 80 per cent of the total cultivators but cultivating only 3) per cent of the area. The remaining 20 per cent farmers hold about 61 per cent of the cultivated area, (*Census Handbook Nizamabad District*, 1981). The details of the members' landholdings are given in Table 1.

Interestingly, there are a few trends which have significant implications for the character and dynamics of this co-operative organisation. In these villages small farmers have more dry land; big/medium farmers have more wet land and the villages which have canal irrigated land show the pattern of dominance of 'Other Castes'. Rainfed agriculture dominated area shows the pattern of small farmers having dry land and big/medium farmers having more wet land and members' representation from these villages is tilted towards 'Backward Castes' or nearly equal representation of 'Other Castes' and 'Backward Castes'.

Major activities of the society are credit supply of fertiliser and pesticides and paddy procurement, processing and rice marketing. Now I will briefly describe the three major activities:

Processing and Marketing

The rice mill was started in 1984 and its procurement till 1989-90 had been according to the feasibility plan. Society has four godowns of 500 mt each. The capacity of the rice mill is 2 tons per hour and it works double shifts (of 13 hours a day).

The member-farmers are paid Rs 10 per qt more than the market price for their paddy as patronage rebate. For procurement of paddy society pays Re 1 per qt to the broker who brings the paddy to the mill. From nearby villages, society procures paddy in its own truck However, it encourages members to come directly to the mill and not through brokers by the policy that if a farmer brings paddy by himself he is paid Re 1 per qt more

TABLE 2: STATEMENT SHOWING DEPARTMENTWISE PURCHASE

Note: The figures in brackets indicate per cent share to total purchase
Source: Annual Reports of the Society.

by the society The farmer is paid either cash or through entries of the amount to savings account as wished by the farmer The payment takes not more than 24 hours

During the year 1990 91 the total procurement till February 1991 has been on cash basis even from members The society does not insist on purchasing paddy only as kind repayment of loan But in cases of procurement on cash basis patronage rebate is not made Due to loan waiver no loan taking member has till date sold paddy to the society as loan repayment in kind The loan waiving has another repurcussion for the rice mill operation Earlier the arrangement with the financing bank was such that enabled the society to do procurement by the cash credit drawn from the bank If the society invested Rs 50 lakh of its own for paddy procurement, the financing bank used to advance cash credit (on 17 5 per cent interest) of Rs 30 lakh to the society for paddy procurement The day to day stock of paddy procurement was sent to the bank and day to day cash credit was drawn from the bank by the society In this arrangement the society could start (with Rs 10 lakh of its own) the procurement of paddy in each season This year (1990 91) the bank has advanced only Rs 2-3 lakh against a procurement of Rs 35 lakh of paddy because ' it has no money' The secretary of the PACS and rice mill manager say that it is because the banks have no money as loans/interests have not been paid by the society in turn because the members who have taken have not done so In any case, this has started affecting the economics of the major profit earning activity (rice mill operation) In the coming months the society would not be able to procure paddy during the season which will mean a huge profit forgone

Supply of Fertiliser/Pesticides

The stocks of fertiliser and pesticides are kept according to the perception of the demand Stocking capacity is of total 550 mt in two godowns and generally it is full with fertiliser stock Pesticides are required in very small quantity Pesticides are mostly needed for cotton and chillies which are grown in very small quantity (that too in dry villages) For paddy and sugarcane not much pesticides are needed

As is evident from Table 2 there had been (i) a steady increase in paddy purchase going up to around half of the total purchase), (ii) in absolute terms steady growth in both paddy and fertiliser purchases and (iii) decline in percentage of total purchase of fertilisers to nearly half of the total purchase (earlier being 80 per cent of the total purchase) Similarly it can be inferred from Table 3 that the sale of fertilisers and pesticides always constituted a major share between the period from 1979 80 to 1983 84 (from 78 per cent to 84 6 per cent) After the year 1984 85 (when the rice mill operation started) the sale of rice has constituted a major share in total sales, followed by the sale of fertilisers and pesticides However, as the loan repayment has suffered a set back after loan waiver announcement, the sale of 'B' component fertiliser (loan in kind—30 per cent of the total sanctioned loan) has stopped in the year 1990-91 But cash sale of fertilisers has gone up because now the farmers have to purchase this essential input on cash basis

Credit Service

The loan for short term agricultural operation (SAO) is distributed every year in April to September and the next June becomes the last due date of recovery District Co operative Central Bank advances SAO to the farmers through the society The bank charges 7 5 per cent interest from the society which in turn advances the loan to the member farmers charging 10 to 11 per cent interest (the balance to meet the service charges of the society)

According to a prominent leader of the area (president of the society for more than 12 years), "In the whole of Nizamabad district many PACs were doing pretty well in loan recovery Previously out of 40 PACs in [the concerned] taluka, there were around 20 PACs where loan recovery was 100 per cent In others it was around 80 to 90 per cent " Talking about society 'A' he said, "Before loan waiver announcement, there were some genuine problems of the members who belonged to four out of 10 villages These four villages are dry villages where the canal water from the dam is not available Three years of drought [till two years back] had badly affected the paddy crops in these villages Those years were really painfull for the farmers of these areas and therefore they were not able to repay the loans " However, trends in the year 1990 91 show that loan recovery rate might not be more than 5 per cent due to Loan Waiver Scheme Table 6 indicates the magnitude of the problem Tables 4 and 5 present the pattern of advanced credit and the trend in loan recovery from 1983 84 to 1987-88 (before the announcement of loan waiver) and thereafter the sudden increase in the number of defaulters and the amount involved

Source Loan Registers of the Society

To sum up, the following are the critical observations which became the basis of my argument and the hypothesis resulting in this paper:

(1) After land reform, this PACS was started in 1954. In 1984-85 rice mill operation was started; the date coincides with the coming of canal water in the area of operation.
(2) Landholding in the area of operation is highly skewed.
(3) A few observations about members of the PACS:
    (a) small farmers have more dry land,
    (b) big/medium farmers have more wet land and in canal irrigated villages majority of big farmers belong to 'Other Castes'; and
    (c) rainfed agriculture dominated area shows the pattern of small farmers having dry land and big farmers having more wet land and members from these villages are more from 'Backward Castes' than 'other castes'.
(4) However, managing committee of the PACS is constituted more by 'other castes' (though the representation of 'Backward Castes' has been increasing in recent years and the presidents/vice presidents and secretaries have been only from 'other castes'. However, all the members of the managing committee belong to higher categories of landowners.
(5) The PACS has been a major source of supply of chemical fertiliser (in cash and kind as part of agricultural credit). In last 10 years, the sales of fertiliser has tripled. In absolute terms both the fertiliser and paddy business are going up
(6) The PACS operates significantly in paddy marketing.
(7) Trends in expenditure show that the interest on loans, cash credits and deposits assumed highest proportion to total expenditure.
(8) On the credit front, loan recovery rate of the PACS had been 60 to 75 per cent before the announcement of loan waiver by the government. However, the rainfed villages had been facing chronic problem on this front.
(9) After the loan waiver announcement, loan recovery has become a problem in a sense that in the year 1990-91 it was nil till the date of data collection (February 1991) This in turn is affecting the major profit-earning activity of the PACS, i e, rice mill operation.

Let us have a brief look at one more PACS which is operating in the Telangana region (Karimnagar district) with slightly different social set up. Unlike the society 'A' this society is predominantly a society represented by 'Backward Castes' and the area of operation is only three villages, each of them in turn showing landholding more in favour of middle farmers of 'Backward Castes'. 'Other castes' have large landholding but numerically they are very small. Furthermore:

(1) The society was started in 1957-58 with 117 members and by the end of 1988-89 it rose to 813. However, only 39 per cent of the members are doing regular transactions with the PACS.
(2) The area and the PACS both are dominated largely by middle farmers and 'Backward Castes'. PACS' managing committee also is dominated by 'Backward Castes
(3) Ricemill was started in 1967 and till today the mill run by the PACS is the only paddy processing unit in 8 9 km radius. The rice mill was modernised in 1978, and its capacity was enhanced further in two phases, first time 1984-85 and second time 1988-89.
(4) In 1981-82 water from Kakatiya canal started flowing in this area and the very next year there had been a sharp jump in paddy procurement and rice mill operations of the PACS Paddy procurement had been going up since then.
(5) The PACS was engaged in fertiliser sales to three villages to the tune of Rs 36 89 lakh in the year 1988-89.
(6) The PACS purchases paddy from the farmers paying Rs 10 more than the prevailing market rates as patronage rebate.
(7) The loan recovery in the PACS had been to the tune of 85 per cent before the announcement of the loan waiver However, the society had been following a policy that if a member has taken loan, whatever paddy he sells to the society, the income would be credited to his ... accounts and after adjustment ... the total loan he would get the ca... payment
(8) After loan waiver announcement, the loan recovery has gone down to 45 per cent The reason for 45 per cent recovery is that the society has near about monopoly in rice milling The farmers who cannot afford to travel 8-10 miles to sell their paddy to private millers, have to sell their paddy to this society. The society first adjusts the loan. In this process, the small and not-well-to-do farmers have been repaying the loans whereas the well-off farmers have been evading it.

III
The Argument

In this section, I would try to weave the facts and read the argument emerging from the above discussion in terms of the relation of the agrarian transformation to the continuum of land reform, co-operative institutions and the Green Revolution. My argument is essentially based on the above detailed observations about one PACS (of 11 villages), corroborated by certain observations about another PACS of the Telangana region This argument can be claimed to be a hypothesis and has to be tested for other areas and regions. This has to be tested simply because the mode of production debate of the 70s has certainly emphasised the multiplicity of relations of production in Indian agriculture across the regions.

Last four to five decades of agrarian transformation has witnessed a process of change from 'cumulative inequality' to 'dispersed inequality'. The emergence of rich peasants, middle peasants and sustainance of small peasants is a story told several times. I, therefore, argue that as the breakdown of patron (landlords) client (peasants) relationship had necessitated the peasant movements and land reforms, the welfare state (based on the coalition described earlier) has promoted the private ownership on land and market oriented agrarian production by filling the vacuum in the market linkages.

TABLE 5: RECOVERY OF LOANS

(Rs lakh)

Year	Collection Target	Collections (Per Cent)	Overdues (Per Cent)
1983-84	41 007	23.78	17.29
	(100)	(57.9)	(42.1)
1984-85	45 79	39.85	15.94
	(100)	(65 2)	(34.8)
1985 86	50 67	32.48	18.19
	(100)	(64.1)	(35.9)
1986 87	49 87	36.25	13.62
	(100)	(72.7)	(27.3)
1987 88	53 97	42 82	11.15
	(100)	(79 4)	(20.6)

Note In 1983 84, the share of overdues to the total collection target was highest, the reason for this as given to me was that in 1983-84 heavy rains destroyed the crops and 1983-84 there was severe drought.

Source: Annual Reports of the Society.

TABLE 6 LOAN ABSTRACT

Years	Defaulters	Amount (Rs Lakh)
1987-88	536	11
1988-89	574	15
1989-90	1554	62

Notes. A Total loan waived—Rs 11,66,566 [Rs 9,00,478 (Principal) + 2,66,088 (Interest)].

B Total principal overdue by June 1990 Rs 62,18,534 minus principal waived Rs 9,00,478 = total principal overdue Rs 53,18,056. Though eligible members for loan waiver are only 353, and amount involved is Rs 11,66,566, nearly every member-farmer have refused to repay the loan.

Source Loan Ledgers of the Society.

This presence of 'welfare state' was manifest in the co-operative institution which helped the early gainers from the land reforms in providing initial capital to carry on their agricultural operation through easy credits. Secondly, like price support system, the co-operatives provided the farmers an opportunity to operate in the market with some bargaining positions. The marketing operations of the co-operatives, especially in paddy, helped the farmers to get remunerative prices of their produce. Thirdly, co-operatives became a major vehicle for extention of Green Revolution technology. Because it provided chemical fertilisers on credit (to be paid after agricultural produce comes in the hands of the farmers), it became possible for the middle farmers also to take up the agenda of 'grow more'. Marketing support already being present in co-operatives, this phase witnessed a transformation of the co-operatives and that was from credit service to business enterprise of paddy processing and marketing. The overall pattern seems that land reforms required institutional back up in retaining the benefits to its beneficiaries and co-operatives filled the gap. The next phase of the Green Revolution was possible (even in a milder form especially in the area which is certainly not a green belt of AP) because the institution of co-operative was there to carry the agenda forward. Farmers (the beneficiaries of the land reforms) henceforth could take advantage of the higher productivity through 'input supply' by the co-operatives and its market support. In this way the PACS were an important linkage between land reform and the Green Revolution in these villages. Hence, the co-existence of dual argument of 'equity' and 'enterprise' in PACS.[6]

Next comes the point of social ramification. 'Welfare state' did provide all these but it had to provide something because its legitimacy depended on the satisfaction of its clientele. The clientele was not a homogeneous group. Agrarian structure consisted of multi-layers of proprietors (in terms of volume of landholding and its caste nexus). Land reform satisfied one essential and common grievance: abolition of jagirdars and zamindars. But beyond that it all depended on which was the emerging group and what were the caste-class-power dynamics in different areas. Hence, land reform benefited the rich peasants, emerged middle peasants of 'other castes' and 'backward castes'. The tenants of lower castes and landless labourers were left outside the purview of permanent benefits of the land reforms. This hybrid ruling elite as clientele needed further benefits if it was to sustain itself (especially the newcomers of proprietors with low capital base). The state through its organs and various institutions did provide these much needed subsidies, protection, credit and marketing support. This in turn sustained the political regime's legitimacy. The last phase of 'productivity agenda' itself was a response to the clientele's urge of 'enterprise' in agriculture.

In this whole process, certain deadlock has appeared: the clientele has learned the language of market and acquired the power to sustain the 'subsidy'—a freedom coupled with benefits from the state. It no longer needs talks of social agenda of restructuring (equity issues) as ruling elite of the villages but its business drive forces it to ask for more subsidy and makes it profitable to have it.[7] Loan waiver scheme is a pointer to this. The harm this ongoing 'subsidy' does to the basic institution of PACS (which has made this 'subsidy' possible) may be of no relevance today to this ruling elite because it has by now well established itself. But in this process, small farmers (if not landless labourers!) are definitely going to be the losers.[8]

Nevertheless, I am not arguing that land reforms guarantee the emergence and success of PACS. But it seems that the limitations/failure of land reform lay the structural foundations of the limitations/failure of the PACS and Green Revolution. I argue for this hypothesis because theoretically speaking wherever land reforms have failed (at least in throwing away the non-cultivating groups and establishing the cultivating owners), the groups which need co-operatives did not emerge. Similarly, agricultural transformation has remained elusive in those areas. A second point which needs to be emphasised is and perhaps ignored in the understanding of the rural co-operative as organisations in Indian context is that rural co-operatives' working has been related to bridging the gap between land reforms and Green Revolution by providing the institutional back-up. These sociological agenda though appearing different and discreet are logically interconnected and represent the process based on the real face of land reforms. The beneficiaries of land reforms and Green Revolution needed the PACS as is evident in the form and content of the PACS. Agrarian transformation and PACS were defined and characterised by this discourse where the interests were articulated in the organisational forms and the organisation of co-operatives in turn provided/facilitated the articulation of a stream of interests.

Notes

[The ideas contained in the paper were presented, for the first time, in their nascent form during a National Seminar on Land Reform and

Rural Change held at NIRD, Hyderabad during December 1991. Subsequently, re-formation and crystallisation has resulted in the form of this paper. I am thankful to Sharit K Bhowmik, Tushaar Shah, Debi Prasad Mishra and Shankar Datta for their invaluable comments and suggestions which helped me considerably in improving on the earlier draft of the present paper. Any errors that remain are mine.]

1 As mentioned earlier, the nature of participation and articulation of the demands was reflected in the proclaimed ideologies (even of socialist variety) and the concrete programmes of Indian National Congress. The character of this agrarian structure is important in understanding the nature of welfare state and the agrarian measures following in the post-Independence period.

2 Sociologically, this change has been described as 'cumulative' to 'dispersed' inequality [Beteille 1974:85].

3 Baru explains this on a broader canvass:

I would like to divide Indian society into basically three layers, one constituting the business classes, consisting of two elements—the national bourgeoisie, and some remnants of the collaborationist comprador bourgeoisie. Now there is a further distinction that I must make, between what I might for the moment term the big bourgeoisie and the regional bourgeoisie. I have been doing some work on recent developments in Andhra Pradesh, and I think one very important and relatively recent development there and in many other places is the rise, over the past 10 to 15 years, of a regional bourgeoisie quite strongly fighting for their own share of the national market. The Khamma capital of Andhra, or the Marwari capital of Gujarat, or the Maratha sugar-barons of Maharashtra who represent the rich peasantry that has for the past 30 years fought the entrenched Parsi-Gujarati business classes of Bombay—these regional bourgeoisie are today actively conflicting with the Tatas and the Birlas. There is sometimes an alliance between these interests and say the interests that Devi Lal would represent in Haryana; together they would represent the upper stratum of Indian society. This is a general statement, of course, for there are hundreds of variants across regions. As against this, there is the bottom stratum, of the working class and the rural landless. The intermediate class is neither of these; it is an amorphous class, which has come into being as a result of the political processes of the past 30 years... [Baru 1990:57].

This ruling elite as different from the hybrid coalition has supported the system peacefully at least till 1975, and after that with fractures [Patnaik 1985, Baru 1990 and Kaviraj 1988].

4 Kaviraj says, "that we should be conceptually more sensitive to the historicity of this ruling coalition. It is a coalition which is constantly in flux; first, many of the policies of the ruling coalition in the state are self-directed, in the sense that it is trying to transform itself and its relatively privileged beneficiary of policies directed at society, but in doing so are also directed at itself. The other thing is that in order to understand politics, we must also understand the double valued nature of each movement, which arises out of the coalitional nature of state power" [Kaviraj 1990:64].

5 Generally, the cropping pattern in the area is as follows: on dry land—jowar and chillies (rabi); pulses and cotton (kharif), on wet land—groundnut and sunflower (rabi); paddy and sugarcane (rabi/kharif).

6 This anomaly has been read by Attwood and Baviskar (1987) as the fine blending of the two in the successful sugar co-operatives and implicitly the triumph of *democratic socialism*. On the other hand, Breman (1990), highlighting the basic contradictions between the ruling elite and the agricultural labourers, has seen it as part of the broader story of bourgeoisie dominance in agriculture. Therefore, he calls the same sugar co-operatives as corporate entities.

7 Quite similar to this trend, as it seems to me, is the observation: "I understand—the inevitable logic of what Gramsci would call demobilisation of the movement—that there is a strong connection between taking on the *passive revolution* kind of strategy giving over the task of bourgeoisie cultural transformation over to the state. It is the task of the movement in the initial phase to suture a coalition which is as large as possible, but after it comes to power this coalition itself threatens it in a sense. And it must find ways of demobilising it..." [Kaviraj 1990:65].

8 I am tempted to see a 'legitimationcrisis' developing for Indian state from this process, though Habermas (1973) has posed the problem for western capitalist states.

Financial Dualism and 'Virtual' Interest Rates

Case of India

Wojciech W Charemza

Subrata Ghatak

Duality of money markets is a ubiquitous phenomenon in less developed countries. Yet, a few vital questions have eluded the focus of researchers and policy-makers: What role does the market structure play in the existence of dual interest rates? What are the methods of correcting distortions in the money market? Do interest rates in the organised money market affect interest rates in the unorganised money market?

Analysing the case of duality in Indian money market, this study presents a simple theory of duality and offers explanations through two new concepts, viz. 'virtual' interest rates and 'virtual' money.

Introduction

IT has now been widely acknowledged that the existence of two different types of money markets—one organised (OMM) and the other unorganised (UMM)—has important implications for the conduct of monetary policy in less developed countries (LDCs) [Ghatak 1976; Taylor 1983; van Wijnbergen 1983 (a); 1983 (b) and 1985]. A dual money market could complicate the smooth operation of monetary policy as it implies the presence of two very different interest rates—one for the CMM and the other for the UMM. Such dual rates are actually observed in many LDCs [von Pischke et al 1983 and Ghatak 1976]. The two segments of the money market are separated for a variety of reasons: e g, differences in transaction costs, informal system of loan administration in the UMM, pattern of flexibility of loan operation, asymmetric flow of information, problems of moral hazard and adverse selection, etc [Ghatak 1976]. The quantity of loans of a particular borrower is generally determined by his/her 'credit-worthiness' (e g, the 'asset' or landholding) and ability to repay; tenurial status; lenders' information about the borrowers and the nature of moral hazards perceived by lending agent. These dual rates, if unconnected, could render the use of official discount rate rather ineffective either as a weapon for controlling credit or as a device to raise savings and investments and thereby the rate of economic growth [McKinnon 1973; Shaw 1973; Kapur 1985 and Fry 1988]. These have been investigated at length recently. However, there are other important issues which have received less prominence in discussion of dual money markets in less developed countries (LDCs). For instance, what role does the market structure play in explaining the emergence of dual interest rates in LDCs? How do we correct distortions in the money markets of LDCs? Do interest rates in the CMM affect rates in the UMM? Most writers, so far have emphasised the role of risk and uncertainty premium in explaining the high UMM interest rates in LDCs [Bottomley 1971; 1975; Ghatak 1975 and 1983]. In this paper we offer a simple theory to explain the existence of dual interest rates in a single economy. We then develop the concept of 'virtual' interest rate and 'virtual' money [Neary and Roberts 1981] in LDCs when a section of the money market is constrained, i e, fails to satisfy all the demand. Such 'virtual' rates are notional equilibrium rates for the utility maximising agents facing credit constraints in the OMM. Next we specify the relationship between the CMM and UMM rates when money markets do not clear and explain how 'virtual' rates clear the markets. It has been argued by the 'Structuralists' that the practical usefulness of financial liberalisation due to rise in interest rates could be limited in LDCs because such rise in rates in the CMM lead to outflow of funds from the UMM [Taylor 1983; van Wijnbergen 1983 and 1985]. Thus credit shortage raises interest rates in the UMM and a consequent fall in the level of investment and output. Structuralists therefore, argue that a positive interest rate policy could be counterproductive.

Clearly, the strength of the arguments stated by the 'structuralist' school depends on a number of assumptions; e g, it is assumed that both the UMM and the CMM operate smoothly and the funds flow freely between the UMM and the CMM. The validity of such assumptions are empirical issues. The 'structuralist' argument would be validated if the UMM rates readily respond to changes in the Bank Rates in the CMM. A rigorous analysis of the relationship between the CMM and the UMM rates in a LDC, i e, India, is the primary focus of this paper. Further, we suggest a method to measure 'virtual' interest rates to indicate the extent of changes to be made in the 'repressed' rates of the CMM to promote greater integration of the dual money markets. So estimates are useful as they approximate the determination of 'equilibrium' interest rates in a LDC with segmented money markets.

II
Model of Dual Interest Rates

It is possible to analyse the existence of dual interest rates in a money market in a simple way (Figure 1). In Figure 1 we measure interest rate on the vertical axis and the demand for and supply of loans on the horizontal axis. If the market clears, E will be the equilibrium interest rate when D_{LF} is the demand for and S_{LF} is the supply of loanable funds in the economy. But, in most LDCs, the money market can be regarded as imperfect, exhibiting strong characteristics of oligopolistic controls. In many LDCs, a few major banks and financial institutions control a very substantial proportion of total supply of loanable funds. Suppose, these financial institutions seek to maximise their utility which now depends on two arguments, the price of loan (r) and the quantity lent (Q_L). They will be indifferent with some combination of Q_L and r and this is shown with the indifference curves like I_1 and I_2. The budget constraint facing the financial institutions is given by the line D_{LF}. Banks optimise by choosing a point like F where the indifference curve is tangent to the budget line. Here the interest rate (r_c) is higher than the equilibrium rate (r_e) in a competitive market and the amount of lending is also lower ($Q_{cL} < Q_{eL}$). This simple diagram clearly illustrates the emergence of dual rates and credit restrictions in a competitive and non-competitive market structure.

Frequently in LDCs, while severe credit constraints operate in the OMM, the UMM acts as a clearing house. Figure 2 illustrates. Due to a state of 'financial repression', interest rate in the OMM is at a very low level (r_1) and an excess demand fixed for loan (=AB) exists. To clear this

FIGURE 1: THE EXISTENCE OF DUAL INTEREST RATES

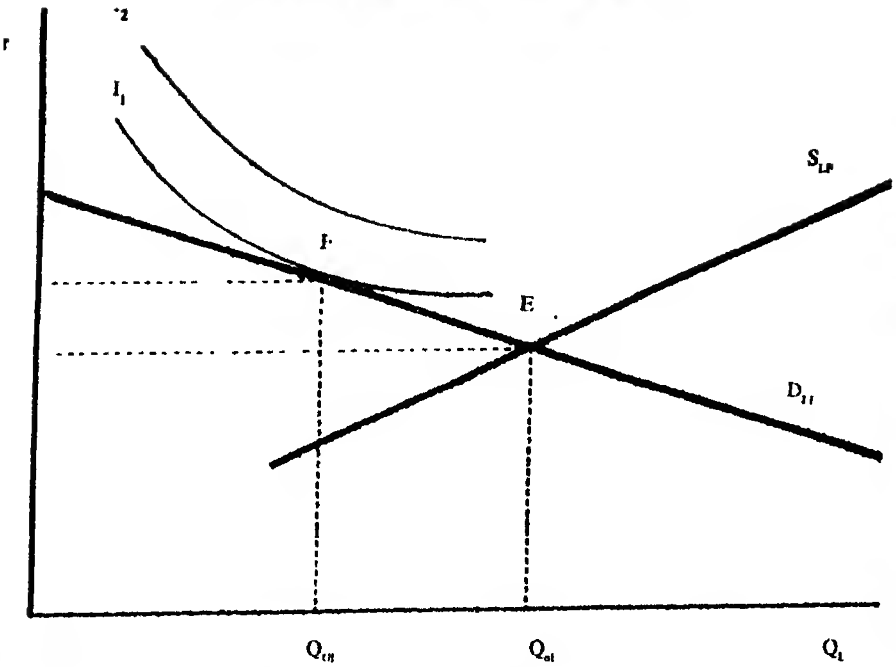

FIGURE 2: MARKET CLEARING INTEREST RATES

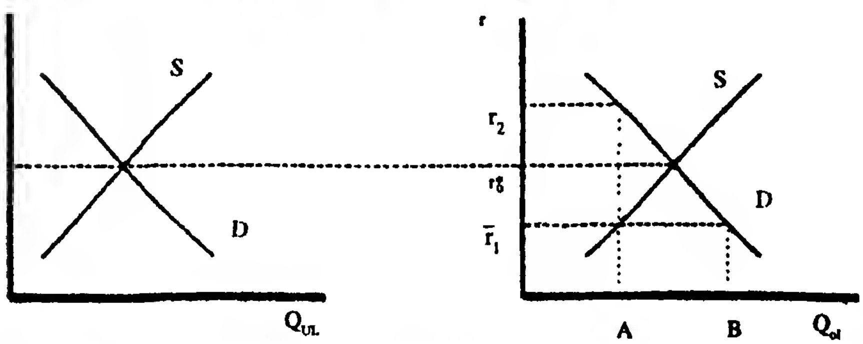

= fixed interest rate

AB = excess demand for loanable funds in official market

$_u$ = r^*_o rates are equalised when the excess demand is satisfied in the unofficial market

xcess demand, the interest rate in the JMM rises above fixed rate in the OMM and the market in aggregate clears t $r^*_u = r^*_o$.

In a dual financial market, borrowers an borrow a certain quantity of loans rom two markets—organised (Q_{oL}) and norganised (Q_{ul}). Thus, a borrower's util-y function (U) is

$$U = U[(Q_{oL} + Q_{ul}), \bar{m}] \qquad (1)$$

vith constraint

$$m = r_u Q_{uL} + r_o Q_{oL} + \bar{m} \qquad (2)$$

vhere r_u = unorganised market rate of interest
r_o = organised market interest rate
m = initial money endowments

Initially, we assume that Q_{ul} is constrained › $\bar{Q}_{uL}$. Maximising (1) with (2) gives the Clower-Benassy type of the effective demand function

$$Q_{uL} = q_u(r_u\ r_o\ \bar{m}) \qquad (3)$$

The demand correspondence for the official market is given by:

$$Q^o_{oL} = q_o(r_u\ r_o\ \bar{m}, \bar{Q}_{uL}) \qquad (4)$$

But, given the features of the dual financial markets, it is useful to assume that Q_{oL} is also constrained to $Q_{oL} > \bar{Q}_{ol}$.

This yields the equation for r_u:

$$r_u = h(r_o, \bar{Q}_{ul}, \bar{Q}_{oL}, \bar{m}) \qquad (5)$$

The virtual interest rates (r_v) can then be defined as [see Neary and Roberts, 1980]:

$$\frac{\partial u(\ )}{\partial(\bar{Q}_{uL} + \bar{Q}_{oL})} \Big/ \frac{\partial u}{\partial(m)} \qquad (6)$$

And the 'virtual' money as:

$$m_v = m + (r_o - r_v)Q_{oL} + (r_u - r_v)Q_{uL}$$

The virtual interest rate, r_v is the rate for Q_{oL} and Q_{ul} which supports the quantity $\bar{Q}_{oL} + \bar{Q}_{uL}$ as a result of the quantity unconstrained utility maximisation for $U = U[(Q_{oL} + Q_{uL}), m_v]$. Figure 3 explains the concept of virtual prices where m is plotted against the total of $Q_L = Q_{oL} + Q_{uL}$. Since the market is quantity-constrained, the iso-utility curve is not tangent to the budget constraint. However, it is tangent to the line A'B' which shows the budget line under virtual rate of interest with a slope equal to r_v. Thus, r_v is the price which would have appeared if the unconstrained consumption demand was equal to the constraints imposed.

In what follows we will specify the empirical tests of the association between the rates in the UMM and OMM. The data for the UMM rates are available for the Indian economy and these are usually called the hundi rates or the bazaar rates.[1] The official Bank rates are known as the discount rates. This will be followed by the analysis of the virtual interest rates. Finally, we will provide some long-run solutions of the virtual interest rates for the Indian economy for 1950-86. Due to the availability of the long-run data on hundi rate, we have used it as a proxy for the bazaar rate.

III
Econometric Results

The previous section suggests the following long-run specification of the relation explaining the hundi interest rate (the UMM rate) for India All data are in natural logarithms.

$$hr_t = \alpha dr_t + \beta m_t + u_t \quad \alpha < o, \beta < o \qquad (7)$$

where

hr_v – estimated bazaar real interest rate[2]
dr_t – official real interest rate
m_t – real money supply (M1)
u_t – an error term

The variables which appear in (1) have been tested for the level of integration [see Engle and Granger 1987]. It is required that all the variables in a long-run equation are integrated in the same order (i e, that their i-th differences are stationary). The aug-

TABLE 1: AUGMENTED DICKEY-FULLER TEST FOR INTEGRATION

Variable	Levels	First Differences
hr_t	2.20	–2.28
dr_t	0.87	–2.92
m_t	0.84	–2.95

Figure 3: The Virtual Interest Rate

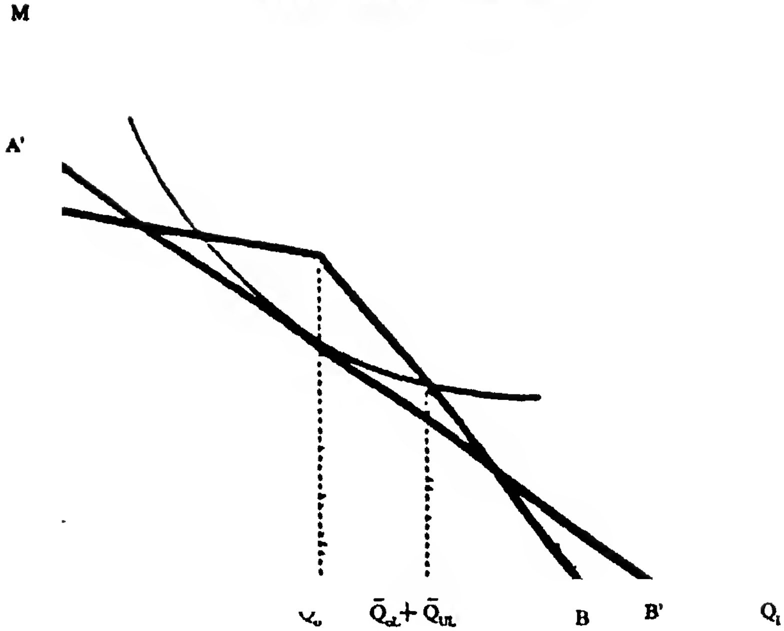

Figure 4: One-Step Ahead Stepwise Chow Test

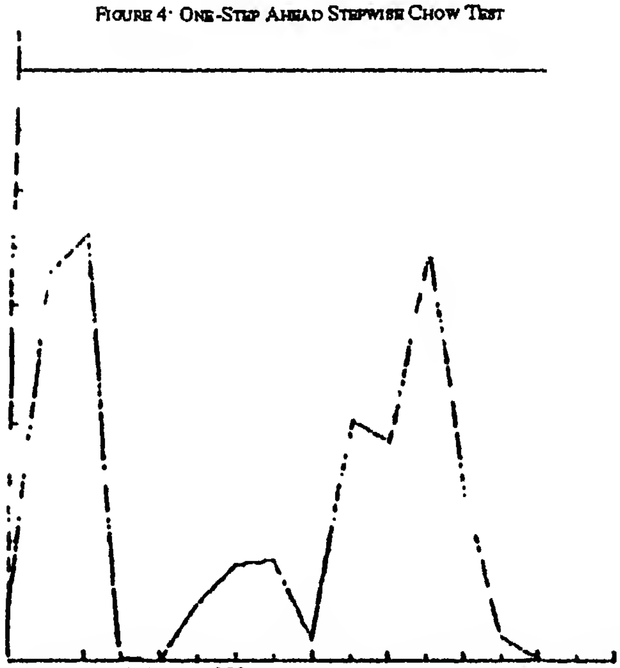


mented Dickey-Fuller ADF test for stationarity of levels and first differences [see Dickey and Fuller 1979 and 1981] gives the results as in Table 1.

Results from Table 1 show that levels of the variables hr_t, dr_t and m_t are not stationary, but that their first differences are stationary (critical values of the small-sample ADF test are given in Blangiewicz and Charemza (1989). Consequently, we can admit that all three variables are integrated of order 1.

To test cointegration of the long-run equation (i e, to check whether the error term in (1) is stationary), the equation has been estimated by ordinary least squares (OLS) and the ADF cointegration test has been computed [Engle and Granger 1987]. The results are as follows:

$$hr_t = \underset{(0.0453)}{1.517} dr_t - \underset{(0.0782)}{0.295} m_t + u_t \qquad (8)$$

$R^2 = 0.904$ $\sigma = 0.159$ DW $= 0.679$
ADF $= -3.58$

where R^2 is the coefficient of determination, σ is the residual variance. DW is the Durbin-Watson statistic and heteroscedasticity/consistent standard errors of the parameters estimates are given in brackets. Although the Durbin-Watson statistic (DW) is quite low, so that the model does not pass the *ad hoc* cointegration test [Banerjee et al 1987], i e, $R^2 > DW$, nevertheless the ADF statistic is low enough to be significant at 0.05 level. Consequently we have some rationale to accept the hypothesis about cointegration of the analysed variables (for the initial values at the multivariate ADF test see Blangiewicz and Charemza 1989).

The estimated equation (1) cannot be used for a more detailed analysis of the market because of lack of proper dynamics, indicated by the low Durbin-Watson statistic. Therefore for estimation of the virtual interest rate we have used the autoregressive-distributed lags of order 1 (ADL[1]) form of the model [Hendry and Richard 1982 and Cuthbertson 1985, p 263].

$$hr_t = \delta_1 hr_{t-1} + \alpha_0 dr_t + \alpha_1 dr_{t-1} + \beta_0 m_t + \beta_1 m_{t-1} + \varepsilon_t \qquad (9)$$

The OLS estimates of the euqation (2) are the following:[3]

$$hr_t = \underset{(0.0530)}{0.758} hr_{t-1} + \underset{(0.129)}{0.606} dr_t + \underset{(0.124)}{0.212} dr_{t-1} + \underset{(0.127)}{0.453} m_t - \underset{(0.109)}{0.592} m_{t-1}$$

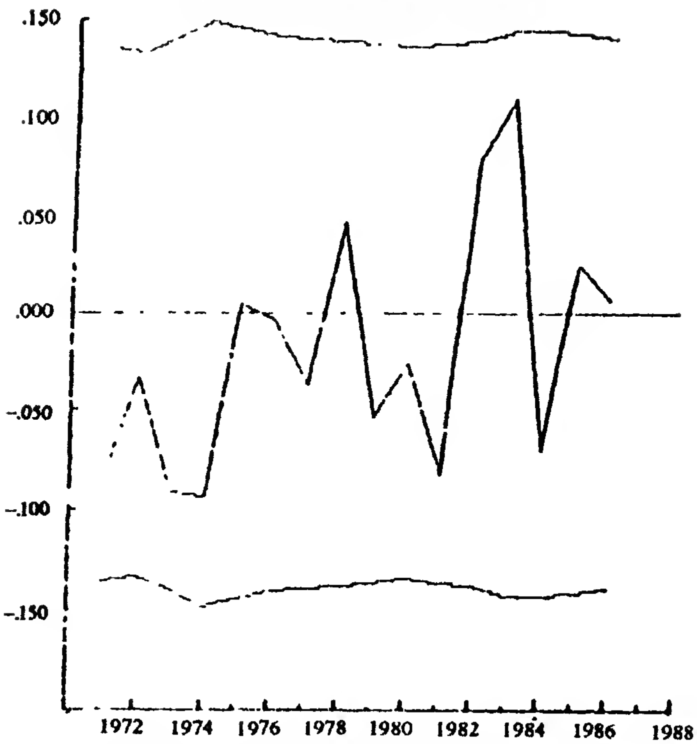
$R^2 = 0.998$, $\sigma^2 = 0.0698$, DW $= 2.26$,
AR3F(3,27) = 0.38, COMFAC-F(2.30) = 4.60
CHOW-F (5.25) – 1.21 hr-F(1,31) = 85.48
dr-F (2,31) = 12.56 m-F (2,31) = 9.05

The additional diagnostics for this equation are: AR3-F = F-test for testing joint autocorrelation of the residuals up to order 3; COMFAC-F = test for one common root; CHOW-F = Chow test for stability of the model predictions for up to five periods ahead computed for the model estimated for a sample from 1952 to 1981,

Table 2: Real Interest Rates—Estimated Bazaar, Official and Virtual Rates

Year	Estimated Bazaar Rate	Official Rate	Virtual Rate
1970	3.60	1.89	2.25
1971	3.67	2.31	2.99
1972	4.04	2.56	3.32
1973	4.32	3.20	4.14
1974	4 07	3.49	4.16
1975	4.39	3.04	3.60
1976	5.96	3.57	4.33
1977	5.72	3.39	4.07
1978	5.66	3.51	4.23
1979	5.71	3.67	4.42
1980	5.77	3.71	4.46
1981	5.54	3.95	4.74
1982	6.64	4.08	5.02
1983	7.45	3.97	4.86
1984	6.88	3.87	4.78
1985	7.18	3.98	4.92
1986	7 08	3.99	4.92

Figure 5 One-Step Recursive Residuals



with data for 1982-86 left for the prediction period and hr-F, dr-F, m-F = F-tests for joint significance of the particular variable (contemporaneous and lagged) in the model. For all the tests in F-form, the number of degrees of freedom is given in brackets.

The results seem to be satisfactory. Especially the ex-post forecasting properties of the model for up to five years ahead are good. Figures 4 and 5 show the stepwise (1-step ahead) Chow statistics scaled by the critical values and the 1-step recursive residuals with the confidence interval equals to ±2 standard errors. The figures indicate stability of the estimated model. The COMFAC statistics is significant, which denies the possibility of reducing the number of estimated parameters by imposing a common-factor restriction.

The sequence reduction of the model does not lead to sensible results [Hendry 1989, p 59]. Especially estimation of the model in first differences of the variables with an error-correction mechanism failed to provide an interpretable result. We have therefore decided to use the above estimates as a base for computing the virtual interest rate.

The static long-run solution of the estimated equation (9) is the following:

$$= 1.630dr_t - 0.574m_t \qquad (10)$$
$$(0.097) \quad (0.224)$$

Wald $\chi^2(2) = 591.7$

where the Wald $\chi^2(2)$ statistic is for the Wald test of non-linear restrictions of the estimated parameters.

According to its definition, the virtual interest r_{vt} equates hr_t to dr_t given the existing constraints on m_t. Hence, the long-run equation (7) can be re-written as:

$$hr_t = r_{vt} + \beta m_t + u_t$$

Consequently, the virtual interest rate can be estimated from (9) as:

$$r_{vt} = \pi dr_t$$

where $\pi = (\delta_1 + \alpha_0 + \alpha_1)$

Using the OLS estimates, it gives $\pi = 1.1525$ with the standard error equal to 0.0445.

The above OLS estimate of π does not reflect changes of the coefficient over time. Hence, it seems interesting to have changes of π (and consequently of hr_t) over time. We have therefore defined the recursive-least squares estimate of π as

$$\pi_t = (\delta_{1t} + \alpha_{ot} + \alpha_{1t}),$$

where δ_{1t}, α_{ot}, α_{1t} are the recursive least squares estimates of the corresponding coefficients. The Bazaar, official and virtual intetest rates (where the latter are estimated with the use of π_t rather than π) are given in Table 2. The results indicate that the greatest pressure on the money market took place in the period of 1982 and 1986, because of the boom in private investment.

Our average estimate of the 'virtual' interest rate in India turns out to be about 15 percent higher than the official rates. Clearly, for policy formulation, the adjustment cost of such distortion is not high

Conclusions

(a) On the basis of our study, we can conclude that in India the Reserve Bank can significantly influence unorganised rate by raising appropriately the official discount rate. Our finding seems to validate the 'structuralist' argument that changes in the official interest rate will have important impact on the rates in the unorganised money markets. The interest rate policy can play a more effective role as instrument of stabilisation.

(b) The 'virtual' interest rates for India are measured for a period (1950-1986) with the data available for the Bank Rate and the average Bazaar rate. Results of the cointegration stability tests suggest that the relationship between the interest rates and money supply was, in the long and sometimes turbulent period of 1950-1986, stationary and stable. In the long run, estimated 'virtual' interest rate in India is on average only one per cent higher than the 'surrogate' bazaar rate; hence, the cost of adjusting the 'distortion' is not high.

(c) In a relatively 'closed' economy, dual interest rates could exist because of the imperfect structure, e g, oligopolistic controls of the money markets in many LDCs. Given the credit constraints and 'repressed' interest rates in the organised money markets, the rates in the unorganised money markets tend to rise considerably to 'clear' the excess demand for loans Our estimate of virtual or equilibrium interest rates in segmented money markets in India suggests that such rates are not very high. Similar estimates could be made for other LDCs to observe the overall cost of adjusting interest rate distortions.

Notes

[The authors thank the participants of the International Conference on Prices and Economic Development, Gregyong Wales, UK, for their comments. The usual disclaimer applies. Financial help from the Nuffield Foundation to carry out a part of this research is also gratefully acknowledged.]

1 The hundi rates are partly determined by a cartel of indigenous bankers while the bazaar rates are perhaps a better reflection of the rates in the UMM.

2 Since data for the bazaar rate are highly heterogeneous and with numerous gaps, we approximated the average real bazaar rate using the hundi rate adjusted for the expected future inflation.

3 The computations were made with the use of PC-GIVE 6 0 microcomputer econometric package All the diagnostics reported in the text are described in detail by Hendry (1989)

DISCUSSION

Minority Identity and Its Discontents

Syed Shahabuddin

MUCH in Mushirul Hasan's analysis of the Muslim response to the evolution of the secular state in India ('Minority Identity and Its Discontents: Response and Representation' by Mushirul Hasan, *EPW*, February 14, 1994) is incontrovertible. However the case for secular modernists as distinct from Islamic modernists suffers from vital inaccuracies and omissions, biased judgments and preconceived notions. He has also weakened his thesis by drawing upon the writing of little known journalists and obscure and minor papers and by not offering any evidence from the writings of the 'Muslim fundamentalists' and the 'Islamic modernists' for condemning them or even for making out a case against Shahabuddins who enjoy, according to him (and the Sangh parivar) political backing and patronage of the state. He has come up with no evidence to support his thesis that the Islamic modernists are against the secular order or to prove that they are belligerent or fan intercommunal discord or even exploit it.

In the Muslim Indian milieu, there is nothing comparable to Hindu chauvinism exemplified by the philosophy, ideology and programme of the Sangh parivar. Indeed, except for marginal elements, Muslim response to the Hindutva has been to reiterate their commitment to secularism. Muslim Indians have always supported secular parties, voted for them, accepted non Muslim leadership, sought protection from and placed trust in the secular state. If the state, the parties and the governments have not lived up to their expectations under pressure from majority communalism or failed them and the country, the Muslim Indians cannot be held responsible.

Yes, there have been and are careerist Muslim politicians who have made and make deals with the political establishment but they have been rejected by the Muslim masses. The so-called Muslim 'intellectuals' whom Hasan sees as the hope for the community, have also been busy trimming their sails to the political winds and leathering their nest and therefore are unable to provide responsible, responsive and effective leadership. Bureaucrats who become sensitive to the anguish of the community on retirement and professors who become responsive on receiving financial support from the state or when the establishment does not shower rewards equal to the expectations are and will remain marginal to the concerns of the community and therefore, incapable of providing leadership

The central problem is to decide whether a religious minority has a political role. Waheeduddin Khan and, to a certain extent, Saiyid Hamid wish the community to forsake the political arena and dedicate its energies to education and economic uplift. Is there anyone who does not want education or economic uplift? But the root question is how to maintain a political environment and a constitutional framework, in which such endeavours can be successfully carried out. If the state embraces Hindutva and adopts a policy of total assimilation or open discrimination, will the Muslim community enjoy the freedom to set up its educational institutions or assure educational culture which is not openly and blatantly anti-Islamic? Will the Muslim youth have equal access to public (or even private) employment? Muslim politicisation in fact is only marginally about religion, it is largely about preserving equality of opportunity and equality before law. Hasan himself admits that the secular parties are under pressure. In fact party like Congress(I) has already adopted 'saffron secularism'. Even the left parties wish to stand up and be counted as nationalist patriots and not to deprive themselves of Hindu votes. Hasan or his secular modernists suggest no alternative course of action on how to keep national politics responsive to the legitimate rights, demands and aspirations of the religious minorities, if the religious minorities were to opt out of politics.

Secondly, in a religious society, a religious community under pressure of assimilation, anxious to preserve its religious identity, the role of the religious establishment cannot be ruled out. But Hasan has not made out any case to prove that the Muslim religious establishment, which has a glorious nationalist past, has been separatist or communal. Even JIH has come down from its high fundamentalist pedestal of Hukumat-e-Ilahiya to support the secular order in the Indian context. But if Hasan thinks that speaking of religious rights or of the rights of a religious community or protesting against violation of the constitutional safeguards is *per se* communal, there is nothing to be said. By that token even so-called secular modernists shall be dubbed communal, even for organising a 'Muslim' meet. But perhaps they are more acceptable because in the long run their objective is political emasculation and cultural assimilation of the Muslim community in line with the desire of the Sangh parivar and a large section of the secular establishment.

Thirdly, Hasan is less than fair and objective in tarring all Muslim politicians with the same brush. Many of us, who are in politics by choice, and bear many a blow and suffer many a privation, have deliberately chosen the wilderness and have been trying, in our own way, to find a viable framework for the Muslim community to live in dignity and equality in its motherland. Of course, some of us have refused to surrender to the forces of Hindu communalism and abdicate our democratic freedom but we have never sought confrontation or conflict. Issues have arisen or have been raised by the adversaries and we have merely sought to resolve them through democratic dialogue within the secular framework. Since Hasan has used the phrase 'Shahabuddins' he must have come across my writings in the press and in *Muslim India*. I would request him to quote one line in support of his thesis that the Muslim leadership had adopted a communal rather than a secular approach.

In fact, the Ulema have been even more cautious and have exercised a restraining influence, because of their wider and longer perspective in time and space and their non-involvement in the day-to-day battles.

Hasan and his intellectual company feel that Muslim should not have reacted to the VHP plan for the Babri masjid (formulated at the instance of Indira Gandhi and implemented later with the support of Rajiv Gandhi). He must at least concede the possibility that every surrender would have whetted the appetite of chauvinism. I am convinced that by taking a legally tenable, morally correct, constitutionally valid and politically sound stand on the Babri masjid, we have decelerated the Hindutva rath, even if we have not been able to stop it and thus awakened the national community to the perils of chauvinism and bought time for it to prepare itself for the battles that lie ahead.

Babri masjid was demolished with the connivance of the state and the central government. It was an act of vandalism. Why should the Babri masjid movement be held responsible for the weakness and vacillation of the secular state? Hasan should try to inject a moral core in the secular order and not prepare the Muslims to accept the inevitability of Hinduisation and to make a choice between physical liquidation and cultural assimilation.

In the long run, the laboured distinction between Islamic modernists and secular modernists will be of no consequence. For one, the so-called secular modernists will remain alien and marginal and while they may be accepted and honoured and used by the establishment, they will have little influence on the course of events. For another, in practical terms, the secular modernists will find it difficult to suggest a logical or effective course of action other than those followed by Islamic modernists. Of course, Muslim fundamentalists, who equate Islam with political power and cannot even conceive of Islam without power or dream of re-establishing Muslim rule in India shall be equally marginal to the future of the Muslim community. The Muslim Indians must seek their destiny within the national framework of the secular state and the international framework of the rights of religious minorities, in an increasingly shrinking world. Minorities, everywhere, shall be led to justice and equality by those who champion their quest for identity and seek a *modus vivendi* through integration and reject assimilation and liquidation.

To set the record straight, I have never attended any meeting of the Jamiat-e-Ulema-e-Hind and the 'walkout', therefore, is a figment of Hasan's imagination.

Economic Reform and Budget 1994-95

The experience of the Indian economy in the recent months has been quite bizarre: foreign exchange reserves have kept piling up, with the government apparently not knowing what to do with them, even as economic growth continues to atrophy. Why does a government find itself incapable of pursuing expansionary economic policies even in situations characterised by industrial stagnation and accumulating foreign exchange reserves? This is an important theoretical issue. **917** The major flaws in the structural adjustment programme lie in two areas and there is no serious attempt in the 1994-95 budget to correct them. First, there is insufficient appreciation of the importance of infrastructural investment and large-scale deployment of resources in *selected* industries in order to make them internationally competitive within a specific time-frame. Second, the government does not seem to have any effective plan for raising agricultural investment and production---a lapse that augurs badly for the long-run internal and external balance of the economy. **923** The 'New Economic Policy', having opened up fresh avenues of making quick money by the affluent middle class and the top rich, has paved another channel of inflation: the wealth effect emanating from paper-wealth made in the stock market, while industry languishes in stagnation. **937** As it was with the decades of planning and democratic socialism, so also now, limited market-friendly reforms are for the rich and the privileged. But the process is unlikely to be sustainable. Low growth and stagnation might cause a reversal. Alternatively, even if growth rates do pick up along a consumption-led path, it may turn out to be unsustainable in a situation where the distribution of the benefits of growth results in what has been referred to as 'unaimed opulence'. **945** The unwillingness and/or inability of the government to control its own expenditures in areas where they need to be cut has resulted in strategies to reduce the fiscal deficit which are questionable and counterproductive. While these strategies continue to hold sway, the measures to promote investment contained in the latest budget are almost entirely confined to the supply side, although available evidence suggests that the problem lies on the demand side. **969** The lowering of customs duties and reduced public investments have meant a narrowing of the home market and dependence on the private sector to promote growth. However, the expected supply side responses have not been forthcoming due to lack of demand in spite of the rise in budgetary deficits. What has been in evidence instead is cost-push inflation. **953** The cuts in government capital spending are at the root of the slow growth of industrial activity in the past three years. The government has been left waiting for private investment. **979** The most glaring failure of the 1993-94 budget is the lapse in fiscal discipline as reflected in the fiscal deficit. To judge whether this is a failure of the finance minister, his government or of the entire polity and economy, one needs to look into the fiscal deficit in greater detail. **983** The economy is not likely to see a major turnaround in 1994-95 for two good reasons: first, the nature, pattern and conditions of investment; and, second, the pattern of channelling of domestic savings. **889** If the heroically assumed revenue buoyancy does not materialise and the finance minister is unable to contain non-development expenditure, as happened in 1993-94, we will be facing disaster. **893** Agriculture can work as the biggest safety net in the process of structural adjustment by softening the rigours of inflation as well as by raising income and employment for the vulnerable sections of the population. But this calls for broadening the domestic agricultural base by stepping up public investment in irrigation, research and extension and in education and skill formation. **1005** The focus of government policies needs to shift from helping and subsidising the organised parts of the economy to building up the economy in the vast unorganised parts, in particular promoting broad-based agricultural growth. **999** International experience with structural adjustment programmes suggests that they often lead to deterioration in social sector development unless specific measures are taken to avoid such an occurrence. The impact of the budgets presented since 1991-92, and in particular the budget proposals for 1994-95, needs to be examined in the light of such apprehensions. **1011** The finance minister's claim that the budget for 1994-95 constitutes a leap towards rationalisation of tax policy is shown to be untenable by an analysis of the changes in union excise duties on the textiles sector. **993** Finances of the Union Government: Special Statistics. **1029**

LETTERS TO EDITOR

Working Class and Left Front

I

S N ROY in his letter (February 12) denounces the romanticism displayed in the report of the Kanoria Jute Mill workers. He, however, errs much more gravely in going to the other extreme of defending the timid passivity of the established union bureaucracy in the face of the onslaught of managements.

Roy repeatedly emphasises that the new dispensation following on the liberalisation of the economy has put labour on the defensive and at a loss to counter management offensives. He feels that the union leaders have no choice but to bow down to the wishes of the management. Such an ahistorical treatment enables him to gloss over the bankruptcy of the left trade union leadership in Bengal in particular and in India in general that has brought things to such a sorry pass.

Trade unions instead of being just the means for securing better working conditions and economic benefits are more importantly organisations that must politically educate the working class for mass action to gain control of the means of production. Ideally the leaders should be members of left parties with a clear programme of revolutionary seizure of power. This is especially necessary because the capitalists invariably resort to buying up workers, creating stooge unions, using lumpen elements and the state machinery to break unions and if none of these succeed to siphon off funds and shift production to areas where labour is not organised. All this is amply borne out by the report on the Victoria Mills case (January 1-8).

Sadly the left trade union leadership has failed miserably in this respect. There has been little attempt to broaden the base of the left trade unions by using the resources of the trade unions in the organised sector to educate the vast majority of the workers in the unorganised sector. Most glaring has been the irresponsible economism of the unions of workers in the public sector and government bureaucracy which have frittered away the gains of more than a century of struggle of workers all over the world which had forced capitalist states to enact labour welfare legislation and implement them at least in undertakings owned directly by the state. The thrust of unionism in India has been towards pressing for nationalisation as a cure for all ills. There has been little understanding of the fact that the capitalists, both national and international, have progressively gained more control of the state apparatus and used the resources and services of the nationalised sector for private accumulation through rent seeking activities and outright fraud. This criminal abdication of revolutionary responsibility by the left trade union leadership is one of the prime reasons why the government has abandoned the notion of a socialistic state or even a welfare state and has adopted the new economic policy based on a free market economy".

The left trade unions could hardly do otherwise as the left parties themselves had forsaken the path of revolutionary class struggle for participation in bourgeois parliamentary democracy. Participation in elections and bourgeois government can only be a temporary means for enhancing revolutionary class struggle but not an end in itself. Yet, in Bengal over the past decade and a half we have witnessed the enactment of the absurd farce of the Left Front government scuttling a militant labour movement in order to remain in power within the bourgeois set up. This has now reached its logical denouement in Brearly and Jain doing what they have done with the Victoria Mills. In tandem with the tremendous growth in complexity and pervasiveness of capitalism world wide in India too there have been sea changes in the industrial, financial and communications sectors over the decades of the 70s and 80s. Simultaneously massive environmental degradation and pollution caused by industrial development has called into question the post enlightenment assumption that man can play around with nature at will. Finally the collapse of the Soviet Union has shattered many dear shibboleths. Few, if any among the ideologues of the traditional left comprehend the implications of these developments and the challenge that they have posed to orthodox Marxist theory and practice. The left trade union leaders are in even deeper waters. No wonder then that 'unions are perplexed how to face the onslaught of management and protect workers' interests".

Militancy of the working class is not something that is fabricated but is born of the anger and frustration arising from exploitation by the capitalists. After long years of class collaboration the likes of Roy are naturally apprehensive and critical of such militancy which exposes their revisionism. Time and again thus CITU and AITUC have opposed and even sabotaged such independent labour action all over the country, in Bombay, in Chhatisgarh and in the Victoria and Kanoria Mills. Class war is not child's play. Many have died in the past and many more have to die in the future. Actions like those of the Kanoria Mills workers, however, futile they may seem now are like sparks that will set the prairie afire. They prove that the working class is indeed the standard bearer of revolution because it is not afraid to die for its rights. It can do without the admonitions of timid 'pseudo-Marxists.

The crisis in the mainstream left parties manifested not only in the alienation of the workers but also in their failure to attract a newer generation of activists. Such activists as have grown up in a Marxist tradition cannot any longer be fobbed off with pitiable analyses like the one given by Roy which routinely emanate from a fossilised gerontocracy. They much prefer the redder hues of Maoism or increasingly nowadays the greener pastures of eco-Marxism.

Alirajpur,
Madhya Pradesh

II

S N ROY in his rejoinder (February 12) to my report on the Kanoria Jute Mill workers' struggle (January 1-8) is guilty of gross misrepresentation and failure to grasp the real thrust of my wordings. But he truly reflects and articulates West Bengal's Left political and trade union establishments' present perplexities, born out of their political and corporate collaborationist policies. I will briefly deal with some samples of these shortcomings.

First, I have not termed the Kanoria workers' action an 'uprising'. Rather, I have taken good care to differentiate it from the action of the communards. The reference to the Paris Commune, otherwise, occurs as the source of the 'original inspiration' of actions of this nature in Italy as well as Howrah.

Second, it will be clear from the dateline of the *EPW* that carried my piece that I had to write it immediately after the initiation of this action. Even then I had noted that the workers had only started production in full swing, that is, in various departments of the mill. At the same time I had foreseen that the "factory will come to a grinding halt". Hence, there was neither a wrong premise, nor a wrong conclusion in my piece.

Third, he misses the full and real meaning of my double-edged appellation *right wing* (emphasis added now) social democratic variety. When he refers to my words, he deletes the adjective 'right wing'.

Fourth, the dead end reached by the Left Front government and its trade union affiliates described by him is, however, a true reflection of the situation today, about which they should do some serious introspection.

Finally, the rationale and justification of the Kanoria workers' 'self-activation', which I glorified, is proved by the fact that it has succeeded in pulling down the Left Front government from the high horse it had been riding. Witness, Jyoti Basu had to, according to press reports, for the first time in 17 years put off his lunch break for one and a half hours to negotiate with the unregistered and unrecognised union. This was followed by immediate registration of the union which the labour department of his government had been illegally refusing to grant so long. This has also been followed by rounds of bi-partite and tri-partite discussions. This union has thus succeeded in achieving much more by the self-activities of the workers than the establishment which organisations have allowed the illegally laid-off workers to starve to death or resort to beggary.

AJIT ROY

Calcutta

ECONOMIC AND POLITICAL WEEKLY

Limited Options

THE central government budget for 1994-95 has more or less put paid to hopes of fiscal stability for quite a while And now we have the full financial year data on the banking and monetary sector These suggest that the monetary authorities are at their wits' end insofar as maintaining monetary and price stability is concerned

Monetary data available up to March 18 which was the last reporting Friday of the fiscal year for such data show an almost unprecedented expansion in primary money and a sizeable increase in broad money (M_3) in 1993-94 M_3 expanded by Rs 65 827 crore or by 17 9 per cent compared to an increase of Rs 49,332 crore or 15 5 per cent in the previous year Among its components, the expansion in currency with the public was phenomenal by 22 2 per cent compared to 13 2 per cent in the previous year Deposit money growth was relatively moderate at 16 9 per cent in 1993 94 against 16 per cent in the previous year but it still outpaced the growth in GDP at current prices thus raising the deposit money-GDP ratio from 42 1 per cent to 43 6 per cent A more disturbing phenomenon was the jump of 24 per cent (Rs 26 577 crore) in reserve money in 1993 94 against just 3 per cent (Rs 2 980 crore) in 1992-93 This happened despite net RBI credit to the central government having been only of the order of Rs 1 334 crore

The monetary situation has slipped out of control for a variety of reasons which are by now known but bear repetition The surge of monetary growth in 1993 94 was almost wholly attributable to rapid foreign exchange accruals The manifestation of the foreign exchange accruals in monetary expansion is a telling commentary on the economic policies pursued by the authorities In the first place, the foreign exchange accruals were not earned through a surplus of exports of goods and services nor have they contributed to any dynamism in production and investment in the economy They were essentially absorbed in upvaluation of stock market assets Secondly, the macro economic policies pursued by the government and the RBI have pushed them into a corner in dealing with the distortions that have surfaced in the economy In the final analysis the answer to the burgeoning liquidity in the system is to productively deploy the foreign exchange reserves in expanded investment and production in the economy so that demand for bank credit and imports picks up Actually 1993 94 saw an exceptionally small expansion of bank credit to the commercial sector, by Rs 15,577 crore or 7 2 per cent against Rs 31,720 crore or 18 2 per cent in the previous year A sizeable part of even this increase was due to additional food procurement credit

The government's expectation that the private sector and foreign investors would revive investment in the real economy has proved to be thoroughly misplaced It is public sector investment that requires to be stepped up, but the government is set against this for ideological reasons As a result, the problem has been thrown into the lap of the monetary authorities who, thanks to the structural adjustment programme, have been left with few instruments of monetary control The RBI and the government were in a hurry to commit themselves to rapid lowering of the statutory liquidity and cash reserve ratios (SLR and CRR) True, in the face of such low demand for bank credit sterilisation of liquidity may not be of much help What the situation calls for instead is the injection of sizeable investible funds into the public sector It is only by expanding public sector social and economic development activities that the private sector is likely to be activated

But to expand public sector activities the government and the RBI have to accept some reversal of their recent policies They had frozen the market borrowings of state governments in real terms which combined with reduced fiscal transfers from the centre has severely curtailed the states resources earmarked for agriculture and rural development as also for the social sectors Instead the banks have been making large investments in government securities and treasury bills which have gone to finance the centre's growing revenue deficits In this situation the states should have been allowed to raise resources through additional market borrowings This had to be done through the SLR route so that the borrowings did not become prohibitively expensive, in fact the yield rates on state government securities needed to be brought down to 11 to 11 5 per cent The central government has also frozen the investment programmes of many public sector undertakings Instead of the government selling PSU equity, the PSUs themselves should have been allowed to go to the market and raise fresh equity capital which would have enabled them to further secure additional investible funds from banks and other financial institutions

The various aspects of financial sector reform such as the move from direct to indirect instruments of monetary control have rendered credit and monetary policies ineffective Likewise, the capital adequacy norms prematurely imposed on them have made banks extremely shy of lending particularly to agriculture, rural industries and the small scale sector If the government were serious about reviving economic activity it must postpone the implementation of the capital adequacy norms by a few years and instead encourage banks to provide additional credit to productive enterprises in the public and private sectors and in the priority sectors which are starved of credit

The structural adjustment programme has also rendered nominal interest rates relatively sticky because mutual funds and other non-banking financial intermediaries have been promising high rates of interest on their units and other instruments on the strength of expectations of sky high effective earnings on equities (including capital appreciation) These expectations have to be brought back to earth by stanching the flow of investment into the secondary market Apart from FIIs the funds raised by Indian companies abroad are also getting invested in the share market In the current situation, there is a case for stopping companies from borrowing abroad as there is one for preventing corporate investment in the saving instruments of mutual funds which should be available only to households

KARNATAKA

Holding Operation

THE fact that the damage limitation exercise undertaken by the Congress in Karnataka is being mooted as the model for dealing with dissidence and dissonance in other states clearly points to the bankruptcy of ideas within the party For, while the gigantic cabinet which Veerappa Moily has been persuaded to create may have temporarily satisfied the various factions, it underlines the party's unconcern with corruption as a factor in electoral politics

Moily, the none too popular replacement for Bangarappa, has been plagued with dissidence ever since he took over One of the major dissident factions has been nurtured by S M Krishna who has been chief minister-in-waiting for a long time Then there have been the various power lobbies around the state's commercial interests liquor stone quarrying, sugar, etc Cutting across these have been the legacies bequeathed by the previous government a chain of corrupt deals which have touched a wide section of legislators In an effort, perhaps genuine to project a clean image after the rampant corruption prevailing in the years before, Moily in his first choice of cabinet colleagues had tried to achieve a fine balance without much success The ensuing struggle which resulted in the vociferous demands for Moily's ouster put the party high command in a quandary As Jagannath Mishra—who brokered the 12 point package with the dissidents, the most important facet of which is the expanded cabinet—candidly admitted there were too many reasons for retaining Moily he had a clean image, a reputation of having established norms of good government, substantial support among the rank and file of party members and, most importantly with the elections not too far away he belonged to a backward caste with a considerable support base However the dissident factor could not be ignored, especially with the high profile Bangarappa floating the Karnataka Congress Party and the possibility that continued sidelining of the dissidents might prove to be detrimental to the party's electoral fortunes

What has resulted is a huge cabinet, in the formation of which Moily has had to include legislators against whom there are corruption charges under investigation For instance, S Ramesh who was close to Bangarappa but turned to Moily when a judicial inquiry was constituted into the police firing at Kunigal for which he was responsible, has been given a berth So has Kodagu Thimappa who was state housing board chairman during the Bangarappa regime and who has been allegedly involved in the housing scheme scandal The cabinet also, for the first time includes three members of the backward idiga community It also has the largest number of backward class members There are six lingayats and six members of the scheduled castes To achieve this Moily has had to make every fifth Congress legislator a minister

Quite obviously, this unwieldy cabinet is not meant to last only to hold up till the state elections In the meanwhile, the final condition of the 12 point package, the reconstitution of the state Congress committee is already in trouble because of the stipulation that party office-holders would not contest the elections As a result there are no takers for these posts The organisational mess with the steady inroads the opposition parties especially the BJP, have been making and the portents from the mammoth rally Bangarappa was able to organise in Davangere recently to launch the election campaign of his new party, do not augur well for the Congress in the state

PHARMACEUTICALS

New Issues

FOR decades critics have been pointing out that the pharmaceutical industry has been spending negligible amounts on research At its best the industry spent only about 2 per cent of its turnover on research and development a minuscule proportion against the 10 to 20 per cent spent on research in the US and the EEC countries MNCs particularly have been faulted for giving low priority to research for even when they did have huge establishments for research as Ciba Geigy did, their research programmes have been without focus or have been entirely directed at 'tropicalising' products

Now with the impending changes in the patent law and an economic environment in which MNCs feel protected, many pharmaceutical giants claim to be planning to re-establish or strengthen research programmes in the country Hoffman La Roche, Hoechst Hindustan Ciba Geigy, Burroughs Wellcome Eli Lilly and a consortium of five Indian pharmaceutical companies, the Pharmaceutical Business Group, are reported to have concrete plans in this direction, with some already in place With fears of their discoveries being copied by Indian companies being allayed, the companies can now make use of the resources the country offers the vast and largely quiescent scientific community whose members, even if not unemployed, are often forced to seek inappropriate employment in non-scientific sectors, the lower salaries (in Indian rupees rather than, say, Swiss francs), the known Indian expertise in process development and, most importantly, a loose and ill-defined ethical and legal framework for conducting research which allows the companies great leeway

That pharmaceutical companies are attracted by the low salaries in India as compared to the home countries is not at all surprising especially given that the cost of pharmaceutical research into new drugs is rising rapidly Companies are focusing attention on fewer new drugs which involve high penalties in the event of commercial failure but are seeking to extend the market life of existing drugs by adding refinements and marketing them under new brand names This is of course one reason why they resist the adoption of a limited drug list which, however, is happening in many countries in the EEC Markets therefore have to be sought increasingly in third world countries Countries like India with a large and growing middle class firmly in the clutches of the ethos of modern medicine and an eminently malleable and growing medical community in the private sector, offer an ideal market Opting to conduct research in these countries gives the industry added advantages, provided patent regimes are friendly

This changing perception of drug companies towards India as a research base is cause for concern It hardly needs to be stressed that research regimes in the country fall in no man's land For instance, there is no clear consensus on who should be allowed to test drugs on what basis a drug is to be permitted for testing or which authority should approve of the research and testing regimes According to clinicians participating in a recent panel discussion on clinical testing organised by ACASH and IOCU in Bombay, doctors are rarely offered a say in the design of the clinical trial nor of course are they consulted on whether a particular new drug is needed And there is sufficient experience to indicate that when the clinical trial of a particular drug has failed, the company simply ignores the trial and manufactures successful trials While in a hospital setting there is supposed to be an ethical committee even though usually a notional entity, drug companies often conduct trials through private practitioners and consultants where there are no controls Another problem is the dearth of effective channels for monitoring adverse drug reactions in the absence of which new and harmful drugs can remain on the market causing great damage, as long as they do not cause drastic reactions which cannot be ignored In Britain it is because of effective monitoring of adverse reactions that certain drugs have been withdrawn recently

While the greatest danger is in the lack of surveillance of clinical trials of drugs, this state of affairs is also true of laboratory research To assume that MNCs will necessarily ensure here the standards of research which obtain in the parent countries is as ridiculous as the assumption about the high quality of MNC drugs, which has time and again been challenged And these concerns relate not only to the products of research but to the safety of reseachers as well The other question--the ethics of engaging in research which is largely irrelevant for third world countries—can only be tackled in the context of a vibrant scientific community committed to ethical professional values, which is yet to emerge in India As of now, there is an urgent need to revive the issue of more stringent controls on research and for

a central authority for approving and monitoring research—an issue which the drug consumer movement raised more than a decade ago.

BANKS

New Ball Game

TWO new private sector banks have been inaugurated with much fanfare, one sponsored by the Unit Trust of India (UTI) and the other by the NRI family of Hindujas. Both banks were even-handedly inaugurated by the finance minister with the RBI governor and other dignitaries in attendance. Besides the UTI's own 80 per cent, the UTI Bank has capital contributions of 10 per cent each from the Life Insurance Corporation (LIC) and the General Insurance Corporation (GIC). But it is proposed to float public issues of equity and reduce the three sponsors' holdings to 40 per cent (UTI 25 per cent and LIC and GIC 7.5 per cent each). The other bank, IndusInd Bank, has been promoted by a holding company called IndusInd Enterprises and Finance owned by the Hinduja family and co-promoted by two Belgium-based Indian diamond merchants. Apparently 60 per cent of the bank's equity has been raised through private placements and the balance through NRI subscriptions. Though the UTI Bank has been sponsored and is as of now owned by public sector institutions, it is the operational character of the bank presumably that makes it 'private', apart from the fact that the public sector banks derive their status from the special statutes relating to bank nationalisaton. In fact it is interesting that the majority of the proposals for opening new 'private' banks are from public sector institutions, including the IDBI and EXIM Bank.

While the UTI Bank has been registered in Ahmedabad and the IndusInd Bank in Pune to satisfy the requirement that the headquarters of the new banks should be in places where no bank already has its registered office, both banks intend Bombay to be their operational headquarters. IndusInd Bank gave up all pretence, and was inaugurated in Bombay, unlike UTI Bank which organised its inauguration at the place of its formal registration, Ahmedabad.

The contradiction between the pronouncements of the finance minister, the RBI governor and other officials on the one hand and the functionaries of the two banks on the other is already glaring. Inaugurating the UTI Bank in Ahmedabad on April 1, Manmohan Singh extolled Gandhiji's concept of trusteeship as being more relevant in today's society than when it was originally enunciated and said that banking institutions should strive for a judicious blend of excellence in service and fulfilment of social and economic objectives. Calling upon the new bank to be a pace-setter in this direction, the finance minister declared, "this is a commitment to the nation as it is the only way to create a feeling amongst the poor that the banking system is not a monopoly of the few rich and vested interests in the country". When he inaugurated the IndusInd Bank in Bombay on April 11, Manmohan Singh was more restrained but spouted similar sentiments. The distinction between the public and private sectors, according to him, had lost its historical meaning and both "have to be partners in ushering in a new India". Further, "banks have to become a major instrument of purposeful social change". The RBI governor was more prosaic, but also more precise. Private banks, he said, would "have to meet priority sector lending targets and other social obligations".

Do these pronouncements really mean anything? Surely, the RBI governor is not unaware that many existing private banks, including the foreign banks, have failed to fulfil the priority sector targets, even after the enlargement of the priority sector concept to include indirect credit to agriculture and lending to big-size small-scale units. In the case of the new private banks (for the first three years) and the foreign banks, the 'priority sector' concept has been distorted by the inclusion in it of the export sector. Similarly, there have been failures in achieving the target of 60 per cent credit-deposit ratio in the rural areas of some states and, more significantly, by branches in semi-urban areas. After the failure to monitor banks' fulfilment of some of their major social obligations, how seriously are the exhortations to the new banks to discharge their social obligations to be taken? According to press reports, at a recent meeting with the RBI governor to discuss the revamping of the rural credit set-up which is in total disarray, the chairmen of some major public sector banks politely refused to involve themselves further in rural lending as that would come in the way of their achieving the capital adequacy norms and adequate provisioning requirements. Also, they were quite blunt, would rural lending increase their profits as required by the RBI itself?

Anyway, the spokespersons of the new banks have lost no time in putting the record straight. The UTI Bank chairman has said plainly that as the bank would concentrate on metropolitan centres, there was no question of it reaching the rural sector. The bank would meet the priority sector lending target essentially through advancing export credit. Further, initially at least the bank would be concentrating on corporate clients. Finally, the bank would entertain no accounts with a deposit of less than Rs 10,000 in Ahmedabad and Rs 50,000 in Bombay. The IndusInd Bank has even less reason to bother with pretences. While its offices in important centres in India are yet to be opened, it has already set up representative offices in Dubai, Hong Kong, London and New York which would all be converted into full-fledged branches by 1995-96. The bank's focus would be on garnering funds from people of Indian origin living overseas; it would also channel foreign investment into India. The bank would touch only quality assets, essentially in exports and in the so-called sunrise industries. The bank's forte would be advisory services in foreign currency risk management, including derivatives like options and swaps, and assisting projects through loan syndications abroad and in India. It is very likely that the bulk of the bank's operations would be off-balance sheet and abroad. Hence its social obligations would be minimal anyway as these are linked to bank credit extended domestically.

So the finance minister and the RBI governor hould have saved their breath. They chose not to; in all seriousness the latter even dwelt--and at the inauguration of the Hindujas' own IndusInd Bank at that—on the sanctity of an arm's length relationship between banks and their promoters!

INDO-US RELATIONS

Strategic Visit

INDO-US political relations, to all appearances, continue to be in the doldrums, even after the US deputy secretary of state Strobe Talbott's recent visit to India and Pakistan This is in contrast to the state of economic relations which during precisely the same period have shown a tendency to bring the two countries closer, particularly on matters relating to trade The latest indication of this tendency was the decision by the US government to lift restrictions on handloom exports from India, following which India may now allow imports of high value textiles from that country

Nevertheless, the low key Talbott visit seems to have smoothed to a certain degree the ruffled Indian feathers on issues concerning Indo-Pak relations including Kashmir, in which connection particularly Talbott mentioned the Shimla agreement as a possible basis for negotiations between the two neighbours The mention of the agreement showed that the US had at least for the moment, come round to the position that Kashmir was an issue largely between India and Pakistan and that there should be a minimum of interference from countries outside the region This was markedly different from the stand projected earlier by the provocative Robin Raphael who at one point went to the extent of questioning the validity of the instrument of accession of Kashmir to India This shift in the US position may make it easier for India to negotiate its dispute with Pakistan over Kashmir Looked at from another angle, however, the shift may only be a ruse to deflect attention from the efforts to promote long-term US interests in the south Asian region If this is true then the real aim of the Talbott visit was not at all to clear the way for an improvement of Indo-US and Indo-Pak relations, the point on which the attention of the majority of observers remained focused

It is necessary in this connection to take notice of two recent reports apparently unconnected with the Talbott visit One report quotes the US under secretary of state Lynn Davis, about an organisation which the US and its allies are trying to put together by October this year The organisation will seek to deny third world countries 'dangerous' modern weapons and technology which can be used for military purposes The organisation will be a successor to Co-ordinating Committee on Multilateral Controls (COCOM) set up during the cold war years to deny modern weapons technology to the communist countries It will now arrange to impose similar restrictions on those third world countries "whose military power the US and its allies want to curb" Significantly, India along with Iran, Iraq, Libya and North Korea, finds a particular mention in the plan

As per the second report, a senior US defence official, Malcolm R O'Neil, who is director of the US Ballistic Missile Defence Organisation, has expressed concern that the Indian missile programme could pose a threat to vital US interests In a speech before the senate Foreign Relations' Committee, O'Neil said that the US defence planners were especially worried about "missile programmes in India, Pakistan, Iran, Iraq, Syria, Libya and North Korea" All these countries, he said, already had or could develop weapons of mass destruction for use with their ballistic missiles "This growing comprehensive capability, coupled with unpredictability", he warned, represented "a serious threat to vital US national interests"

Together, these two reports make it clear that the US's ongoing efforts to bring about non proliferation on nuclear weapons and to deny missile technology to third world countries stem from a *realpolitik* desire to maintain its strategic superiority in different regions of the world, quite a few of them falling in the third world At the same time the exclusion of certain countries from the list of the third world countries which have developed or have the potential to develop such weapons and technologies—such as Israel—and the attempts to deliver such weapons and technologies to certain other countries (e g, F16 bombers to Pakistan despite India's strong objections) show that the approach of the US to this issue continues to remain carefully selective

Viewed in this light and in this broader context, Talbott came to India as an agent of the US defence planners, and his brief was to put a block in the way of India's efforts to emerge as a formidable military power in the south Asian region by appearing to persuade Pakistan to cap its nuclear programme in exchange for F16 bombers The media projected Talbott as engaged in precisely such 'persuasion' in Islamabad, however the content of his talks with Pakistani leaders and officials in private may have been totally different

TRADE AND SOCIAL CONCERNS

Selective Patriotism

THE height of patriotism to which the Indian government can rise is to tell Washington that it has no business to ask New Delhi how it hashes up Indians—whether by laws like TADA or through 'encounter deaths' or by environmental pollution or ruthless exploitation of cheap, including child, labour While the Rao government readily accepts advice from the same Washington experts to restructure our economy and thereby sacrifices our intellectual property rights, it refuses to let go of its own rights—both legal and illegal—that allow some of the worst forms of human rights abuse in India It seeks to obtain national sanction for continuation of these oppressive practices by raising the super-patriotic slogan that since the US is questioning them, it must be our patriotic duty to deny that they actually occur here

This paradoxical behaviour of New Delhi—kowtowing to Washington's dictates in relation to our economy on the one hand and resisting its advice on social issues (e g, environment and labour practices) on the other—is quite often explained away by both US and Indian political observers and journalists as a 'love-hate relationship' But there is a method in this lovers' quarrel! The rhetoric that both Washington and New Delhi use in this quarrel suits their respective immediate interests There is a need to demystify it

The US—after the collapse of the Soviet Union—is confident enough to dominate the economy of countries like India, which have lost their bargaining capacity in international trade and political negotiations with the loss of Soviet support For all practical purposes the Dunkel proposals (to which New Delhi is compelled to be a party, its petulant protestations notwithstanding) ensure the US the right to call the shots in the Indian economy The brouhaha raised by some US spokespersons tying the trade agenda to the demand for respecting human rights international labour laws and environmental protection reflects two interests One is the protectionist interest of the US and western business establishments which are concerned about the threat to their respective competitive stakes by possible cheaper goods imported from the developing countries (like India) that are manufactured through exploitation of cheap labour and under less demanding environmental constraints The other is the pressure exerted on Washington by domestic environmental and human rights groups which have been increasingly protesting against the import and consumption of goods that are produced in Indian sweat shops at the cost of the health of child labourers or of ecological degradation

The Indian government s argument that since labour practices and human rights are internal issues and standards vary from one place to another Washington and the west cannot lay down uniform rules is a specious one calculated to suit the traditional exploitative profit-mongering instincts of the Indian bourgeoisie The western governments indeed have their own self interest in shedding crocodile tears over the plight of the Indian workers But that is no reason why India on its own should not stop such abominable practices as sweatshops or improve its human rights record India's refusal to change these conditions cannot surely be paraded as the country's firm determination to resist US pressures, when the same government is knuckling under Washington's dictates to sell out the economy

RAS KMK Lamipack

RAS KMK Lamipack (RKL) is setting up a project to manufacture soft squeeze laminated tubes in collaboration with the KMK group of Switzerland The company has been promoted by Sameer A Kaji, Vikram H Kaji and their joint venture partners, KMK Karl Maegerle Lizenz AG (KMK) and Propack Holding AG (PPI) of Switzerland PPI, a member of the KMK group of companies, will have a 50 99 per cent equity stake in RKL through an upfront equity contribution of Rs 8 crore and convertible unsecured loan of Rs 10 crore KMK and PPI are global leaders with 40 per cent world market share in laminated tubes and have 34 licensees and 11 joint ventures in over 30 countries The project which is being set up in two phases will have a total capacity of 306 million tubes and will be set up with state of the art equipment at Chakan on the Pune Nasik highway about 100 miles from Bombay The project which is being set up at a total cost of Rs 50 3 crore is expected to commence commercial production this month To part finance the project the company will enter the capital market with a public issue of 89,68,000 equity shares of Rs 10 each at par into a 100 per cent marketing tie up with Global Resources Inc of USA in addition to a technical collaboration agreement with Granvil D Treece, aquaculture specialist of Texas A and M University USA The project enjoys a low break-even point and there is no gestation period as the company has already implemented its pilot project successfully To part finance the project the company is entering the capital market with a public issue of 43 00 000 equity shares of Rs 10 each at par on April 21 The issue is lead managed by Bank of Baroda and KMF (formerly Kuku Motor Finance)

Satyam Cement

Satyam Cement, belonging to the Somani group, plans to tap the capital market with a public issue of 42,50,000 equity shares of Rs 10 each at par to part finance its project to set up a mini-cement plant using the cost efficient and proven VSK technology The plant will have a capacity to produce 200 tpd of portland cement and is being set up at Kalipura village in Jhabua district of Madhya Pradesh, adjacent to the limestone deposits in MP and Rajasthan and within a distance of 100 kms from the market The project costing Rs 9 3 crore is in an advanced stage of implementation and commercial production is expected to commence by August this year Satyam Cement has entered into a memorandum of understanding with Somani Cement under which the former will supply its output on a 'first basis' to the latter which in turn will market it through its established network

Suryachakra Seafoods

An existing profit-making company, Suryachakra Seafoods is setting up a farm of 72 hectares of water spread area, a feed mill plant with a capacity of 1,800 mtpa and an ice plant The project which is being set up at a total cost of Rs 9 8 crore will use inhouse technology and has equity participation by The Marine Products Export Development Authority (MPEDA), ministry of commerce, government of India The company has entered

Shasun Chemicals

Originally set up in Madras in 1977 for manufacturing analgin ip powder Shasun Chemicals has also set up facilities for the manufacture of ibuprofen and ranitidine at Pondicherry and Cuddalore respectively It now plans to expand its installed capacities for ibuprofen from 840 tpa to 1 200 tpa and for ranitidine from 60 tpa to 180 tpa The expansion is primarily due to improvements in the process developed in house, resulting in a significant reduction in the batch processing time The company plans to part finance these expansion plans through a public issue of 15,00,000 equity shares of Rs 10 each at a premium of Rs 30 per share The issue aggregating Rs 6 crore is to open for subscription on April 18

Shaper Chemicals

Shaper Chemicals completed its project for manufacture of 3,4 DCNB OCPNA, 2,6 DCPNA and 3,4 DCA in April 1993 by setting up a versatile multipurpose plant designed to suit unit processes rather than a single product While implementing the project the company identified several new products with assured markets for which the process was developed in house and it decided to expand its existing capacity for manufacturing 3,4 DCNB from 350 mt to 400 mt and also diversify into the manufacture of several other products such as CFA, MCA, acetyl chloride and DCFB which are all key intermediates having applications in dyes, pesticides, pharmaceuticals and drugs The project estimated to cost Rs 6 4 crore is to commence commercial production of the new products from July this year To part finance the expansion-cum-diversification the company has come out with a public issue of 40,60,000 equity shares of Rs 10 each at par on April 18

Capital Trust

One of the pioneers in the field of providing consultancy and advisory services to international banks, Capital Trust is presently rendering consultancy and advisory services to Berliner Bank AG Germany Commonwealth Bank of Australia and Royal Bank of Canada The company is a category I merchant banker and has been granted special permission by RBI to accept deposits from non resident Indians on repatriable basis In addition the company is also engaged in the business of domestic leasing with almost 100 per cent recovery of lease rentals since 1986 The company now plans to enter the capital market with a rights cum public issue of equity shares The public issue will comprise of 19 07 400 equity shares of Rs 10 each at a premium of Rs 2 per share and opens for subscription on April 21 while the rights issue which will consist of 12,85,600 equity shares of Rs 10 each at par will open for subscription on April 26

Dolphin Laboratories

Dolphin Laboratories plans to introduce immuno biotherapeutic drugs (used for prevention of recurrent infections) for the first time in the country The drugs are currently under clinical trials on successful completion of which the company plans to manufacture the same in technical association with Laboratories OM SA Switzerland The company is presently engaged in manufacturing and marketing ethamsylate formulations (used to stop or minimise bleeding), amoxycyllin and doxycycline formulations (antibiotics used for treatment of a wide range of infections) lipotropics (used for treating liver disorders) aminoglycosides (used for treatment of post operative conditions) and non steroidal anti inflammatory drugs (NSAIDS) (used for relief of pain and for treatment of rheumatic disorders) To meet the increasing demand for its products the company is setting up a new plant at Sanand in Gujarat at a total cost of Rs 9 crore which will be part financed through a public issue

Ravish Infusions

Promoted by V K Chawla and Economic Development Corporation of Goa Daman and Diu Ravish Infusions is setting up a project for the manufacture of intravenous (IV) fluids The company is importing FFS equipment from SIFRA which will have a capacity of 38 000 (500 ml) bottles and 25,000 (1 000 ml) bottles per day and will use both polyethylene and polypropylene plastic material with the sysfpac LVP (large volume parental) system Commercial production of IV fluids is expected to commence in October this year To part finance the project the company is entering the capital market with a public issue of 46,00 000 equity shares of Rs 10 each at par on April 28

CURRENT STATISTICS

EPW Research Foundation

The fiscal year 1993-94 has ended with a 10.2 per cent rise in WPI largely contributed by substantial increases in the prices of primary articles and commodities of common consumption. The year has also ended with a massive liquidity bulge with M_3 expanding by 17.9 per cent (15.5 per cent) and reserve money by 24 per cent (3 per cent) due to sizeable foreign exchange accruals. Growth in bank credit for commercial sector was niggardly. Index of industrial production during April-December 1993 grew by 2.4 per cent with capital goods industries continuing to show a sizeable decline. Despite the ban on forward trading, BSE sensitive index has shown an increase over the past month with a corresponding rise in market capitalisation and in P/E ratio

IVP

Helped by Diversification

IVP, a company primarily engaged in the manufacture of vanaspati, foundry chemicals, plasticisers and industrial ceramics, has shown a higher net profit in 1992-93 Production and sale of vanaspati, the company's mainstay, fell to 10,629 mt (11,054 mt) and 10,418 mt (11,131 mt) respectively, mainly due to the lower prevailing price of oils and fats and poor offtake between December and March 1993 Production of foundry chemicals and plasticisers was also lower at 8,595 mt (10,256 mt) and 861 mt (936 mt) respectively Sale of foundry chemicals fell to 8,431 mt (9,750 mt) and that of plasticisers was lower at 890 mt (899 mt) and consequently net sales fell by 8 9 per cent over the previous year Operating profit was higher by 5 4 per cent and despite a 13 per cent rise in interest charges and a 12 per cent rise in tax provision over the previous year, net profit rose by 6 2 per cent in 1992-93 The company raised the dividend rate from 15 per cent last year to 17 per cent in 1992-93

The adverse conditions prevailing in the capital market forced the company to postpone its rights-cum-public issue The issue which will consist of up to a maximum of Rs 30 crore worth of equity shares and/or convertible debentures at a premium yet to be decided, is being made to part finance the company's working capital needs

The company has entered into two technical collaboration agreements with Cerasiv GmbH, Germany, for the manufacture of high alumina ceramics The first agreement is for the manufacture of high alumina faucet discs, an import substitute product, while the second agreement is for upgradation and increasing the product range of the industrial ceramics division

Situated at Reay Road, Bombay, the company's R and D centre focuses on product development, import substitution, technology upgradation and optimising on raw material cost Its efforts during the year under review have reportedly resulted in improved yields, higher efficiency, product improvements and import substitution

Though the vanaspati industry has been suffering due to pressure on margins following excess capacity and poor realisations IVP has managed to improve its overall performance in the first half of 1993-94 due to its diversified nature While net sales for the period rose marginally to Rs 41 6 crore from Rs 41 5 crore in the corresponding previous period, net profit rose from Rs 1 8 crore to Rs 2 1 crore over the same period with lower interest and operating expenses contributing to the better bottomline

KOTHARI SUGARS AND CHEMICALS

Steady Growth

Ever since its inception over three decades ago, the Madras-based Kothari Sugars and Chemicals (KSCL) has been a steady performer Over the past eight years, the company has posted a compounded annual increase of 23 6 per cent in net sales with net profit and net worth growing by 32 5 and 34 5 per cent, respectively During 1992 93, despite a substantial increase in manufacturing and other expenses as also interest burden, KSCL has reported an 84 6 per cent growth in operating profit and 50 per cent rise in gross profit Profit after tax too registered an impressive increase of 17 per cent even after providing for higher depreciation, though the company paid no taxes at all during the year

Headed by B H Kothari, KSCL has factories at Kattur, Nagoor and Manali, all in Tamil Nadu The company manufactures sugar, polybutenes and para/orthonitro chloro benzenes (PNCB/ONCB) During 1992 93, while the Kattur factory crushed 4,19,306 tonnes at an average recovery of 10 05 per cent and the company exported 7,500 tonnes of sugar, the polybutene unit achieved a production of 4,442 mt, of which 147 mt were exported to Singapore and other countries Apart from the KVIS 10 grade, this plant also produces various grades for application in cable jellies, 2-T oils, adhesives, etc Production of PNCB/ONCB, which is used in paracetamol, methyl parathion, dyestuffs, dye intermediates, etc, totalled 3,107 mt

KSCL's research and development wing has enabled it to improve the quality and yield of sugarcane which has resulted in better recovery Besides, it has resulted in development of polybutene-based high temperature grease and setting up of manufacturing facilities for cable jelly at Manali Plans are now afoot to develop various downstream chemicals out of polybutene and paranitrochlorobenzene

Recently, the company has started exports of chemicals and has also commissioned a distillery unit with a capacity of nine million litres per annum of industrial alcohol

The company's half yearly results for 1993-94 have also been encouraging While net sales have grown by 10 per cent to Rs 32 62 crore, gross profit improved by 31 per cent to Rs 32 6 crore and net profit spurted by 68 per cent to Rs 2 7 crore

LYKA LABS

Broadening Product Range

After experiencing a turbulent period between 1989 and 1991 owing to price controls on 70 per cent of its drugs and foreign exchange constraints which saw its performance dipping to an all time low, the Bombay based Lyka Labs has regained its prominence Prudent cost management policies enabled it to post a 44 5 per cent rise in operating profit while a smaller increase in interest burden of 13 8 per cent enabled it to post a 170 per cent growth in gross profit Profit after tax went up from a mere Rs 46 lakh in 1991-92 to Rs 2 2 crore in 1992 93 in spite of making higher provision for taxes Total income, however, increased by only 16 9 per cent as against 95 8 per cent the previous year, the 121 per cent rise in other income notwithstanding Remuneration to employees as percentage of gross value added and value of production declined considerably For 1993-94, the company expects to post a turnover of over Rs 100 crore

Learning lessons from the past, Lyka has decided to depend less on drugs that come under price control and is broadening its product mix by aiming at an even proportion (50 50) of controlled and decontrolled products It is expanding the range of decontrolled pharmaceutical formulations and diversifying into non-pharmaceutical activities like health-care gadgets Boosting exports is also high on its agenda to stay afloat in the highly competitive pharmaceutical industry and Lyka is setting up a subsidiary in Hong Kong for the same purpose At present, the company's products are exported to the CIS, Far East, Africa, Caribbean Islands and Latin America

Besides, Lyka Labs has embarked upon a major diversification programme into health care systems The company has tied up with European and American leaders for market development and distribution of a host of health care equipment With Air Sep Corporation of the US, the com-

* 12 months, ** 18 months

pany has decided to promote medical devices called CABA (compressed air breathing apparatus), which produce pure oxygen for medical use from air in the room or atmosphere In a tie up with another American firm, Becton Dickinson, the company will be marketing a new concept in blood collection systems called 'Vacutainer' Vacutainer is an evacuated closed and sterile collection system which prevents infection among doctors nursing staff and patients It is also diversifying into products meant for patients who have under gone colostomy, ilestomy and urostomy due to cancer and related diseases with Coloplast of Denmark Further, Lyka has tied up with Terumo Corporation of Japan for marketing Surflo IV catheters new generation devices for transferring intra venous fluids

Through its own research and develop ment efforts the company has commenced commercial application of improved for mulations in the field of antibacterial, dermatologicals, anti TB drugs, gastrointestinal agents, antihistaminc and herbal products It spent 0 7 per cent of its turn over on R and D during the year Its future emphasis is on developing new ayurvedic preparations, formulations of newer molecules new dosage forms, controlled drug delivery systems, improvement in process for better yield and cost reduction, bioavailability, bioequivalence and clinical studies on formulations of newer molecules

For the first six months of 1993-94, Lyka Labs has achieved a turnover of Rs 47 5 crore as against Rs 42 9 crore during the corresponding period last year The overall profitability has also improved with the company posting a gross profit of Rs 2 1 crore The company has attributed the improved results to substantial increase in export sales apart from diversified activities in diagnostic and medical equipment

RATHI ALLOYS AND STEEL

Sharp Rise in Costs

After a lacklustre performance in 1991-92, Rathi Alloys slipped deeper into the red in 1992 93 The unprecedented recession and the severe competition in the steel industry, particularly in the stainless steel segment put pressure on the company's margins Though net sales improved by 38 per cent over the previous year, the company's operating profit fell by 62 7 per cent and it suffered a net loss of Rs 14 8 crore Sharp increase in input costs and power tariff led to a 51 per cent rise in manufacturing costs while total remuneration to employees increased by over 70 per cent over the previous year Production and sale of mild steel rolled products was higher at 95,997 mt (45,700 mt) and 91,850 mt (45,819 mt) respectively, while that of mild steel rose to 3,113 mt (695 mt) and 2,564 mt (2,327 mt) The continuous teething problems of the hot strip mill (HSM) on introduction of new products only worsened matters Though certain balancing and additional equipments are required in order to stabilise the operations of the HSM, the company was unable to implement these plans due to financial constraints

Even the company's rights issue which was made to finance the cost overrun of the HSM modernisation and expansion programme was undersubscribed and had to be devolved on the underwriters Following the issue the company's paid up equity capital increased to Rs 20 2 crore

The company has reportedly developed hot rolled (HR) coils in high carbon and medium carbon grades as well as in stain less steel Being one of only three suppliers of LPG sheets (which are used for making LPG cylinders) in the country, the company expects demand to pick up due to the government's policy to open this sector for private investment and the re ported backlog of nearly a crore of applications for new connections in the waiting list Though the setting up of infrastructural facilities for this will take some time the company is presently installing some small balancing equipments in order to start commercial production of LPG grade sheets

With a view to concentrating on its Alwar plant which provides more scope for achieving higher levels of production with more value added, the company proposes to sell its Ghaziabad unit Following this the Alwar plant has reportedly improved its operational efficiency

STEEL TUBES OF INDIA

Hit by Recession

The government's deflationary policy and the consequent rigid control on credit led to a contraction of demand, particularly in the engineering industry Though Steel Tubes of India managed to improve net sales by 3 6 per cent over 1991-92, the company's profitability could not withstand the difficult market conditions and operating profit and net profit fell, albeit marginally The continued recession in the automobile industry which is the major consumer of the company's products also affected the company's operations leading to lower production The depreciation in the value of the rupee resulted in higher cost of imported steel leading to a sharp rise in 6 per cent rise in manufacturing expenses Further, energy costs also saw a rise following deterioration in the power situation in the state and the consequent captive generation resorted to by the company After declaring a 15 per cent dividend last year the company has skipped dividend in 1992-93 due to the prolonged recession and pressure on liquidity

The company's exports rose to Rs 1 5 crore from virtually nil last year and it expects exports to further expand to Rs 10 crore in the current year (1993-94) It plans to increasingly cater to the energy sector in addition to developing new products and upgrading quality

The company's paid up equity capital increased to Rs 10 crore following conversion of fully convertible debentures issued last year The issue had been made to finance its modernisation and balancing cum-expansion scheme The company expects to achieve higher production on the expanded capacity for the current year

Steel Tube Investment and Finance, a wholly owned subsidiary of Steel Tubes of India, posted a net loss of Rs 9 lakh after a profitable year in 1991 92 when it managed to earn a net profit of Rs 14 lakh on a total income of Rs 1 4 crore

The unorganised sector constitutes up to 40 per cent of the Rs 18 crore steel tubes and pipes industry, which is suffering from excess capacity Further the non-availability of HR coils has further added to the industry's woes leading to low average capacity utilisation of 40 per cent This is reflected in the company's performance for the first six months of 1993-94 when netsales stood at Rs 50 crore, an increase of 16 per cent over the corresponding period last year, while net profit was lower by 15 per cent over the same period at Rs 1 crore

1994-95 Budget: A Total Surrender

Arun Ghosh

The economy is not likely to see a major turnaround in 1994-95, for two good reasons: first, the nature, pattern and conditions of investment; and, second, the pattern of channelling of domestic savings. Both are affected by not only budgetary policies but also other economic policies.

THE excitement and anticipations of the annual budget, presented on February 28, are long over. The 'Demands for Grants' of the various ministries and departments of the government are now to be examined by committees of the Lok Sabha (in line with the US procedure, but without any semblance of the expert assistance provided to the Senate and House finance committees). The general debate on the budget is practically over; one gets a foretaste in the finance minister's reply to the Rajya Sabha debate, the opposition to the budget being categorised as politically motivated by the 'forecasters of doom'. The media have been apathetic at best; the upper middle classes have been smacking their lips, enjoying the tax concessions granted to the rich, unconcerned with the future of the economy or the condition of the poor who have to face the scissors' effect of inflation and declining employment opportunities. Deep down in their hearts, even large industrialists are now getting worried; but making money fast in the financial markets is the name of the game today. To repeat an old cliche, the general mood is: 'in the long run we are all dead'. Make hay while the sun shines.

Meanwhile, general elections are two full years away, and the politics of defection has now made it possible for the Narasimha Rao government to get away with anything. And though the Finance Bill is yet to be passed by the Lok Sabha, one can almost predict the concessions likely to be made before its final passage in the Lok Sabha: first, a concession to the 'brokers' in regard to the tax on 'services'--mild as it is, it tends to reduce the play of black money on the stock exchanges—and the other in respect of certain excise duties (e g, on steel and the rubber and leather industries) which have already been seen to have been ill-advised, and hurting the small units in particular.

Why does the 1994-95 budget—designed to please everybody—have exactly the opposite effect on almost everybody? The reasons are not far to seek, but they need to be listed as we go along.

First, all financial pundits and experts would despair at the total loss of 'budgeting capability' in the finance ministry. Indeed, the whole purpose of the annual budgetary exercise appears now to be lost with the (Revised Estimate for the) revenue deficit for 1993-94—mind you, these are not 'actuals', which may yet turn out to be considerably different—turning out to be nearly twice the amount budgeted last year, a whopping increase from Rs 17,630 crore (budget estimate) to Rs 34,058 (revised). What credence does one give to the budgeted figure of Rs 32,727 crore as the revenue deficit for 1994-95 in these circumstances? And for a finance minister to leave this order of gap between revenue expenditure and revenue receipts when—despite six consecutive good monsoons, a bumper harvest and large quantities of foodgrains in stock (more than 21 million tonnes) with government—prices have still been rising relentlessly (the latest index for wholesale price in early February being 8.7 per cent higher than this time last year) would smack of either total irresponsibility or an unwarranted gamble for political reasons.

Let us be clear on two points at the outset. First, most critics of government policy have all along been saying that, in the light of the favourable agricultural situation and the complete stagnation of industrial output, together with signs of increasing migration from rural to urban areas and of increasing unemployment all over the country, there is need for a significant step up in government investment on infrastructure which would stimulate overall investment, production and employment. The logical-cum-theoretical construct for such a step is admirably summed up by Amit Bhaduri and Kazimierz Laski in this journal ('Relevance of Michal Kalecki Today', February 12, 1994, pp 356-57) and one does not need to add to their succinct and well reasoned analysis. Secondly, most critics have also been pointing to the need for higher and more effective direct taxation of the rich, and the tightening up of procedures to collect the taxes payable by those who evade the income tax. Indeed, even the National Institute of Public Finance and Policy (NIPFP)—a government funded research body—has long been at pains to show precisely how this can be done, e g, by tracing personal telephone and electricity bills paid by the urban elite who are not even 'assessed' for income tax. But these pointed suggestions have sadly been without any effect. The need for higher taxation of the rich is urgent in India for several reasons. Apart from the dire need to raise more direct tax revenue (in order to bring the budget in better balance), such taxation is essential to restrain the 'demonstration effect' of elitist consumerism, which has many dire consequences including erosion of the savings habit among the middle classes, and increasing crime by the youth of the country whose yearnings (for the 'goodies' of life) far exceed their incomes.

But strangely, the 1994-95 budget continues to increase the tax concessions on the rich, on the palpably wrong premise that increased consumption expenditure by the rich would stimulate production and investment activity. In fact, the simultaneous reduction of income tax rates and of import duty rates, and the assumption that import duty collections would still increase (from Rs 22,500 crore in 1993-94 to Rs 25,200 crore in 1994-95) implies the expectation that imports would increase significantly over the year; and that would be possible—in the background of duty free imports of power and fertiliser equipment, and significantly lower rates of duty on all other capital goods – only if there were a splurge of imports of elitist consumption goods or components thereof. This is likely to be doubly harmful. First, we would be frittering away the foreign exchange reserves—built up essentially through the import of capital (to be discussed later)—without any noticeable stimulus to domestic production and domestic economic activity. Secondly, as indicated earlier, this is only likely to reduce the overall savings rate in the economy, which will (*ex post facto*) be blamed on the recent reductions in the rate of interest. In fact, it is *not* the rate of interest that would really deserve the blame for the recent decline in the savings rate, but the overt encouragement to elitist consumption and the demonstration effect thereof.

Let us get back to the budget for 1994-95. From a budgeted 'fiscal deficit' of 4.7 per cent of the GDP, the actual fiscal deficit for 1993-94 now turns out to be 7.3 per cent. The finance minister's claim that the 1994-95 fiscal deficit would be pegged down to 6 per cent of GDP obviously lacks credibility, in the background of what happened in 1993-94. (It is, of course, possible that we

would have rampant inflation in the country during 1994-95 and, as a result, the GDP in nominal terms may go up sharply, whether or not there is any real increase in output, but obviously that is not what even the finance minister would like to see In effect however, the actual scenario may well be one of a double digit figure of inflation, together with actual cuts in government expenditure, which may result in the classical World Bank/IMF type of prescription of reduced government *investment* expenditure resulting in stagnation of output associated with price inflation, and an increase in GDP in nominal terms The fiscal deficit *can* be brought down thus but with wholly undesirable consequences on the economy

What are the possibilities of such an occurrence? Well we have had six consecutive good monsoons, from 1988 onwards If the 1994 monsoon turns out to be not so favourable there would be an immediate pressure on prices True the government has large stocks on foodgrains but already, the Food Corporation has started liquidating stocks by open market sales Much would depend on what strategy is adopted by the central government, in the summer of 1994 if the rains fail

The focus of the 1994 95 budget has been entirely on the industrial economy, on savings in the form of financial assets The focus continues to be on the mobilisation of rural savings which have of late been dissipated on speculation in the stock exchanges After peaking in 1978 79, real investment in agriculture has steadily gone down, even the latest estimates (for 1992-93) indicate the real investment in agriculture is still below the 1978 79 level

So, in the event of even a partial failure of the monsoon there are two alternative approaches that can be adopted by the government One would involve the mobilisation of unemployed rural labour for rural works, a sort of Food for Work programme Such mobilisation is possible if we have a functioning panchayat system, if—as a result of democratic decentralisation —we already have blueprints of local area development programmes which can be quickly implemented by the available idle labour force available in rural areas But nothing has been done over the past several years to put into position an effective machinery for implementing such a programme Indeed, democratic decentralisation is not even part of the agenda of the present government, notwithstanding the 72nd Amendment of the Constitution

So, the other scenario is more likely, and would be consistent with the present government's philosophy of globalisation of the economy, and market driven economic policies We may accelerate market sale of foodgrains from government stocks, and seek to replenish them by imports, something that the IMF, the World Bank, the GATT would applaud Unfortunately, the problem would be lack of purchasing power in the villages Well, the Jawahar Rozgar Yojana is always there, and the funds thereunder can be supplemented But the way the programme has worked so far in most parts of the country, a few days of employment can be provided to the vast reservoir of labour force some piecemeal, wholly *ad hoc* works would be undertaken starvation deaths may be averted but not destitution nor poverty, and certainly, not many long lasting public works would be completed

And, of course, the revenue (and the fiscal) deficit would burgeon The finance minister would have a ready (and convenient) alibi for the failure of the economy to turn around

Indeed, the economy would not see a turnaround even if the above grim scenario does not emerge, even if we have a seventh consecutive good monsoon The combination of policies instituted in the 1994-95 budget cannot revive the capital goods sector in India

There are basically two good reasons why, even under the most optimistic assumptions, the economy is not likely to see a major turnaround in 1994-95 First, one has to look into the nature, pattern and conditions of investment in India Secondly, one has to see the pattern of channelling of domestic savings Both, incidentally, are affected by not only budgetary policies but also other economic policies

Let us look at the investment side First, the financing of plan capital expenditure is budgeted to decline from Rs 19,672 crore in 1993-94 (revised) to Rs 18,520 crore in 1994-95 True, the total plan investment of public enterprises (including departmental enterprises like the railways) is budgeted to increase to Rs 50,066 crore in 1994-95 from Rs 43,892 crore (revised) in 1993-94 But then, the revised estimate for 1993-94 is Rs 3,343 crore lower than the budgeted figure (for 1993-94) of Rs 47,235 crore And, since we have already seen how inept our budgeting capability has become of late, where is the assurance that the 1994-95 budgeted figure of plan investments (of public enterprises) would materialise, especially with lower budgetary support than last year?

In effect, the government expects major investment—even on infrastructure—to be made by the private sector, for which purpose foreign investors are being wooed This 'wooing' takes two forms The first is by guaranteeing a return of 16 per cent on equity, (e g, for power generation, where the conditions are so twisted as to give a return significantly higher than even the guaranteed 16 per cent return) This issue has been discussed in this column earlier, and we may pass on to other issues The second method of 'wooing' foreign investors is the handing over of highly profitable areas of investment, e g, the exploitation of 'oil' from 'proven reserves' without any liability to 'explore', as for instance, the handing over of the Mukta, Panna and Tapti oil fields 'proven' by the ONGC to foreign investors

Direct foreign (private) investment has come in, as per the *Economic Survey*, in the above two areas (plus consumer industries like beverages), and more such investments are expected—may be through a gradual takeover of majority equity—in the field of telecommunications (where the profitability of metropolitan and overseas services is very high, profits from which are used today for financing the setting up of rural exchanges) The budgetary policies are relevant in this context insofar as the budget has extended several concessions—including lower taxation of profits—to foreign portfolio capital exclusively

And yet, it needs to be stated at this juncture that foreign investment cannot—and will not—finance the development of infrastructure The foreign investments for power generation approved so far will have a capacity of only 3,000 MW, but what is important to note is that 40 to 60 per cent of the total investment in these projects would be provided by Indian financial institutions, i e, by savings generated within India, and when one compares this contribution with the inflated capital costs of foreign investor-owned power generation companies, one would realise that in effect, the bulk of the resources required are provided from domestic sources

TABLE 1 CENTRAL PLAN ASSISTANCE TO STATES (NET)

(Rs crore)

	1993 94 (Revised)	1994-95 (Budget)
(1) Central assistance for state and UT Plans (Statement 16 of Expenditure Budget, vol I)	21,014	19,304
(2) *Less* Recoveries of loans and advances from states and UTs (p 21 of Receipts Budget)	(–)4,076	(–)4,243
(3) *Less* Interest receipts from states and UTs (p 8 of Receipts Budget)	(–)9,724	(–)11,163
Central Plan transfers to states net of all repayments	7,214	3,896

In the process, the equipment manufacturing capacity of the BHEL—and of other indigenous equipment manufacturers—remains underutilised. In fact, it is this policy which is likely to ensure that the Indian capital goods manufacturing industry would remain in a deep hole during 1994-95 despite a lot of cosmetic changes in the budget in its favour. The pattern of financing of investment in infrastructure—'tied aid' or foreign investor owned enterprises (where a substantial part of the financial resources is still supplied by Indian savings)—is likely to deny Indian producers even the opportunity to bid for orders, though they may be competitive in every way.

Secondly, the pattern of channelling domestic savings is, again, unlikely to help the domestic equipment manufacturing sector. As stated earlier, the focus of government policy has been the mobilisation of personal savings through the financial sector; and savings in the form of financial assets have been provided numerous incentives. But the rate of interest payable by small producers still remains high. As a result, the capital market is flush with funds with little demand. And another part of government policy, that of government borrowing at market rates of interest, makes it profitable for banks to sit back and buy government securities. With the average borrowing rate of banks at some 8 per cent, and with the coupon rate on government securities varying between 12.75 and 13.5 per cent, banks have little interest in providing advances to agriculture and small industries. While the interest rate policy is independent of the budgetary exercise, the government decision to float loans at what is termed the 'market rate'—but which is, in fact, higher than the market rate, in the sense that the IDBI lends to industry at lower than the government market borrowing rate—ensures both a steadily increasing revenue expenditure (by way of interest on public borrowings) and a piquant situation where a large segment of the financial sector is not enthused to promote either agrarian or industrial investment.

Indeed, with the philosophy of 'market driven' investments, even institutions like the UTI are now more intent on 'playing the market' than in promoting new investments. During 1992-93, for instance, the UTI collected Rs 4,000 crore of net private savings. These funds were deployed primarily for buying existing scrips in the stock exchange—and to keep up the value of shares held—than to finance new investments. Meanwhile, there has been a cut in the plan outlay of the railways; and there has been a persistent shortage of funds for investment in power generation and transmission, oil extraction and refining, and other key sectors of the economy.

The 1994-95 budget thus cannot, in any sense of the term, be deemed to be growth-oriented.

This becomes all the more important when the impact of the centre's budgetary proposals is examined with reference to the impact on the resources available to the state governments. There are essentially four elements in the devolution of central funds to state governments. These are: (a) various statutory transfers (and some non-statutory transfers like 'relief' funds); (b) share of central taxes to states; (c) central plan assistance to states (including assistance under centrally-sponsored schemes, wherein states have to contribute a percentage, thereby tying the latter down to first funding centrally-sponsored schemes); and (d) deductions, by way of repayment of past loans as well as interest on outstanding loans, which is a charge on the state governments' resources payable to the centre.

It would be instructive to spell out the third and fourth types of transfers. The figures in Table 1, extracted out of the budget documents are quite revealing. They reveal that in 1994-95 there is likely to be a decline in the net transfer from the centre to the states, for Plan outlays, by as much as Rs 3,315 crore. In fact, the net transfer to states and UTs for Plan outlays (when adjusted for all types of repayments) works out to the pitifully small figure of Rs 3,896 crore. These figures are never trotted out; what is trotted out is the total gross Plan assistance. Even that figure stands reduced in 1994-95 as compared to 1993-94 (RE).

To add to the problems of the states, the centre has given up revenues which it has to share with the states. Under the Constitution, the Finance Commission lays down, once every five years, the share of states in the centre's collection of direct taxes and of excise duties. The centre has relaxed on both. According to the finance minister's statement in parliament (while presenting the budget for 1994-95): "The loss to the states on account of reliefs in personal income tax is Rs 625 crore and the gains on the excise duty Rs 148 crore" (*vide*, part B of the Budget speech). Let us not go into the issue of optimism or otherwise in regard to tax collections; as per the finance minister's own statement, the states stand to lose Rs 477 crore (net) as a result of the tax concessions granted to the rich, the elite of this country.

Meanwhile, who pays for all these 'give-aways'? Food subsidy has been cut by Rs 1,200 crore. Administered prices of foodgrains have been raised significantly. So have prices of oil products and railway freight rates, which will have an impact on all prices, thereby affecting the poor adversely. Meanwhile, direct taxes have all been lowered, mainly as a concession to the capitalists, to the rich and the elite.

What is really intriguing is the abolition of the 'surcharge' on the income tax even while the revenue deficit remains an all-time high. On the basis of the finance minister's statement that, at Rs 54,915 crore, the fiscal deficit of 1994-95 would be 6 per cent of the GDP, the GDP would work out to Rs 9,15,250 crore. On this basis, the projected revenue deficit of Rs 32,727 crore would be 3.6 per cent of the GDP. One should note that this is higher than the revenue deficit, at 3.5 per cent of the GDP, in the crisis year of 1990-91 (*vide, Economic Survey 1993-94*, p 15).

One is expected, in the normal course, to analyse the likely impact of the budgetary proposals, especially in regard to revenue collection and expenditure. After all, that is what the annual budgetary exercise is about. But the 1994-95 budget defies logic. It is so palpably biased in favour of the rich, of the foreign investor, and so visibly against the multitudes of poor in this country, that a detailed exercise is uncalled for. One last word, however, becomes necessary, taking some of the data taken from the *Economic Survey*, in

TABLE 2: CAPITAL INFLOW INTO INDIA, APRIL-DECEMBER 1993

		($ million)
(1)	Direct investment

Source: Economic Survey 1993-94.

conjunction with some of the announcements made during the budget speech and later

The budget for 1994 95 has obviously been tailor made to suit the foreign investor. The comfortable reserves figure of $ 13 billion announced by the finance minister on budget day (February 28) was essentially due to the large inflow of external capital, partly long term and partly short term. The *Economic Survey* spoke of foreign exchange reserves of $ 10 9 billion as of February 4 1994. the *Economic Survey* also gave details of trade and payments during April December 1993. Let us briefly see how the reserves have increased from some $ 6 billion at the end of March 1993 till February 1994.

During 1993 94 the deficit on merchandise trade account is estimated to be only of the order of $ 1 billion and net outflows on 'invisibles' account is estimated (by the *Economic Survey*) to show a modest surplus by the end of the year. Net outflows under investment income and against interest payments on external debt are estimated at around $ 3 6 billion for 1993 94 as a whole against which one may assume gross aid disbursements of something like $ 5 billion over the year. That would leave a small surplus of say half a billion dollars for the accretion of reserves over the year.

And yet foreign exchange reserves had increased by some $ 7 billion even by the end of February 1994. The explanation lies in private capital inflow. Let us examine the nature and pattern of this private capital inflow. Again let us take the help of the *Economic Survey* for breaking down the capital inflow during April December 1993 (Table 2).

It would be seen that between April and December net foreign private capital inflow into India was of the order of $ 2 6 billion of which direct investment was $ 425 million and Euroequities issued by Indian companies comprised $ 358 million. Over April December 1993 therefore, the net external aid receipts (taking gross external aid minus all payments arising out of servicing foreign investments and interest on external loans) plus net inflow of private foreign capital would have led to an increase in reserves by $ 4 billion. Between February 4 and February 28 exchange reserves increased by more than $ 2 billion. Most of the capital inflow was on account of FII's portfolio investments.

What are these investments about? First let us look at the nature of Euroequities raised by Indian companies. To the extent that these are Global Deposit Receipts (GDRs) raised by Indian companies, for raising working capital at interest rates lower than in India these are clearly short term funds which can evaporate overnight.

But then the general feeling is that portfolio foreign investments—through the stock exchanges—are here to stay. May be, may be not. But then, how is this discussion relevant in a discussion of the budget? Well thereby hangs a tale. The 1994-95 budget seeks to raise Rs 4,000 crore through the sale of the equity of public enterprises and the seven specified public enterprises—the equity of which is to be partially divested—for which an announcement has already been made include BHEL Bharat Petroleum, NALCO, HZL, Videsh Sanchar Nigam, Mahanagar Telephone Nigam and the ONGC.

Well that is no surprise. International finance capital can gobble up these companies with ease. Take the BHEL. Its equity is Rs 250 crore. The current value of its assets is between Rs 20,000 and Rs 25,000 crore. The divestment of 20 per cent of its equity has so far been at a pittance, and that story is going to be repeated because the Indian capital market has no depth when compared to the immense resources of Foreign Institutional Investors. And the irony is that the prices for the divestment of the equity of the MTNL, the ONGCL, the VSNL, etc, are being laid down by foreign financial institutions (like, for instance, Morgan Stanley) who have been officially appointed 'fund managers' for the Euro issues of these companies.

The capital was recently agog with excitement over a major conference of foreign fund managers, organised by *Euromoney*. International finance capital has now truly conquered the capital, and the instrumentality for this has been the budget and related economic policies.

The 1994-95 budget has made clear cut plans for the sale of India's most prized assets. In the process, India's foreign exchange reserves may look good for a while, but the real cost to the people of this country is one that is difficult to measure.

Financial Expert or Wizard?

R M Honavar

If the heroically assumed revenue buoyancy does not materialise and if the finance minister is unable to contain non-developmental expenditure, as happened in 1993-94, we will be facing disaster

THE logic underlying the budget for 1994-95 seems to be as follows. The experience of 1993-94 would indicate that it is extremely difficult, if not impossible, to cut down non-development expenditure. Interest, which is the largest single item, is not amenable to any reduction so long as budget deficits exist and have to be covered by borrowing. The problem has been made more difficult by borrowing at higher and higher interest rates in recent years. The second item, defence expenditure, is equally intractable so long as Pakistan is our neighbour and so long as we are not able to forge diplomatic weapons to match those of Pakistan over Kashmir. The third item, subsidies mainly on fertiliser and food, also seems to have joined the intractable category this year. Till now ritual noises were made that these should be brought down. But this year Manmohan Singh questioned in his post-budget TV interview the very basis of this demand. He argued that even in developed countries where the farming population is not more than 3-4 per cent of the total population farm subsidies are a very sensitive matter as the GATT negotiations showed. In a country where 70 per cent of the population lives in rural areas he seemed to imply that contemplating any drastic reduction of fertiliser subsidy would be highly unrealistic, to say the least. Regarding food subsidy the point was made about targeting it to the right kind of people without mention of how it was to be done and by how much it would fall. Curiously enough the *Economic Survey* still maintains that 'resources needed for more public investment in irrigation, rural communications, schemes for control of land and water degradation and other agriculture related infrastructure are only likely to be available if the massive subsidies provided for water, electricity and fertilisers are scaled down'.

As for the rest of non-developmental expenditure Montek Singh Ahluwalia threw in the towel, again in a post-budget TV interview, saying that the saving of a few hundred crores of rupees would not be worth the hassle involved. It would be better, he argued, if we change our sights and seek a solution to own budgetary deficit problems in the thousands of crores we would be able to raise through taxes if only the tax system was simplified and better administered. We should give up the old fashioned way of raising the rates of taxation and rely on the buoyancy of the tax system which will yield higher and higher revenue as the GDP goes up. We should really try therefore to see that the economy grows at a satisfactory rate.

How is this to be achieved? By rationalising the tax system and cutting the rates of taxation. This would lead to better administration, better compliance and better revenue yield. The changes suggested with regard to excise and customs duties, the extension of the modvat system, the replacement of specific duties by *ad valorem* duties, the elimination of different tax rates for the same commodity according to use, the reduction of the tax categories and the reduction in duties—all seem desirable and overdue. So also the cut in corporation tax rate and the lending rate of banks.

But the finance minister's actions with regard to some other direct taxes seem surprising and liable to the charge that he is vote gathering. The raising of the exemption limit from Rs 30,000 to Rs 35,000 because trade unions among others represented to him does not make sense, particularly when there is a need to broaden the tax base by bringing in more people into the tax net. The concessions given almost consequentially to working women and senior citizens seem even more inexplicable. Finally, the raising of the limit of gifts given at the time of a wedding to Rs 1 lakh is almost bizarre. It is difficult to see why these concessions were made when the presumptive tax system introduced to bring more people into the tax system has proved such a total failure. Perhaps he, like writers in business magazines, has his eye on the 200 million strong Indian middle class and feels that these concessions will raise the demand for white goods, TV sets and audio systems and other durables and through them excise and customs revenues.

II

The budgetary situation has worsened seriously between the BE and RE 1993-94 for the following reasons. The fiscal deficit has increased by Rs 21,592 crore because customs and excise receipts and receipts from disinvestment of PSUs have gone down by Rs 9,266 crore while non-plan expenditure has gone up by Rs 7,774 crore and plan expenditure by Rs 4,775 crore. Non-plan expenditure increases are mainly on account of increases in subsidies by Rs 3,300 crore and defence expenditure by Rs 2,320 crore. The plan expenditure increase is on account of a step up of the central plan by Rs 1,771 crore and plan assistance to states and UTs by Rs 3,004 crore. As a result instead of being 4.6 per cent of GDP the fiscal deficit has risen to 7.3 per cent of GDP.

The larger fiscal deficit is sought to be met by increased borrowing of Rs 16,485 crore mainly through loans other than long-term and medium term loans and through short term loans. The rest is the increase in the budgetary deficit from Rs 4,314 crore to Rs 9,060 crore which will be met, one supposes, through borrowing from the Reserve Bank of India.

In 1994-95 the budgetary deficit is sought to be maintained at Rs 6,000 crore by increasing revenue receipts by Rs 9,918 crore and increasing expenditure by only Rs 7,827 crore. Other receipts are to increase by Rs 1,000 crore or so. Plan expenditure is higher than the RE for 1993-94 by Rs 556 crore only but non-plan expenditure is higher by Rs 7,271 crore.

The increase in tax revenue is as follows: Corporation tax Rs 1,980 crore, income tax Rs 1,425 crore, customs Rs 2,700 crore, excise Rs 4,950 crore. On the capital side disinvestment of PSUs is to yield Rs 1,500 crore more but loans other than mid and long term are to bring in Rs 2,992 crore less.

The increase in non-plan expenditure is mainly on account of an increase of Rs 8,500 crore in interest payment and an increase of Rs 1,510 crore in defence outlay. On the other hand, there is to be a decline of Rs 2,000 crore in major subsidies from Rs 10,300 crore in 1993-94 RE.

III

The whole revenue exercise banks heavily on growth of income. Income tax revenue is to increase by 15 per cent in spite of raising the exemption limit, rearranging the slabs and giving up the surcharge. The budget estimate of corporation tax revenue for the year 1994-95 is to be 19 per cent higher than in the revised estimate for 1993-94 in spite of a 5 per cent reduction in the rate of corporation tax. To achieve this would need an approximate increase of about 35 per cent in the corporate income assessable to tax. This would require a similar increase in sales or an increase in profitability of these on a lower sales increase.

The increase postulated in the customs and excise revenue would also require increases in assessments. The figures given below indicate in a crude way how much the increase will have to be.

	Customs Revenue (Rs Crore)	Imports (US $ Mn)
1992-93	23,776	21,882
1993-94	22,550 (RE)	21,179
		Estimated
1994-95	25,200 (BE)	22,633 (?)

Everything else remaining the same it will need a 7 per cent increase in total imports Since duty rates have been brought down the figure would be higher still And as this increase is to come mainly from machinery, project imports baggage, chemicals, metals, plastic parts of motor vehicles and instruments, the increase in imports of these items will have to be much higher than the overall increase estimated above

With regard to excise revenue the following table tells the same story

	Excise Revenue (Rs Crore)	Per Cent Growth in Index of Industrial Production
1992 93	30 831	1 8
1993 94	31 750	3 8
1994 95	36 700	13 8 (?)

Again as the increase in excise revenue will come from ferrous metals, man-made fibres and yarns, plastics, rubber products, detergents, machinery cement, petroleum products, cigarettes and cess on crude oils, etc, the growth in these items will have to be much higher

Assuming that there will be no slippages in non-development expenditure in 1994-95—unlike in 1993-94 this is a vital assumption if we are to learn anything from the experience of 1993-94—the success of Manmohan Singh's budgetary strategy hinges on a rapid growth of industrial output next year which will yield higher customs and excise revenue

For this to happen several favourable factors have to materialise Firstly, agricultural performance has to be good next year We have had two good monsoons in 1992-93 and 1993-94 and past trend indicates the possibility of a hiccup in 1994-95 If this happens certain agro-based industries may suffer and more importantly agriculture's demand for industrial goods may suffer If this happens the hopes for the required increase in industrial output may not materialise as also the buoyancy in revenues

Secondly, in theory with all the changes in excise and customs duties and concessions to exports they must boom and thus contribute to an expansion in industrial output The 20 per cent increase in exports in the first half of 1993-94 should lend credibility to such an assumption An examination of the figures, however, indicates that though an item like plastics and linoleum shows a 119 per cent increase the export items which are absolutely large are gems and jewellery, ores and minerals and oilmeals Manufactured items like readymade garments, primary iron and steel and leather manufactures do not show much of an increase If cost considerations were not the cause of their inadequate performance it is doubtful if they will move up next year as a result of these budgetary changes In that case even an export increase of a high order based on the same factors may not promote the growth of the domestic industrial sector

Finally, one comes to the question whether (because of the concessions given) more growth can be expected in those items of industrial output which have registered a 6 per cent growth this year? High growth rates have materialised in beverages and tobacco, jute textiles and leather and fur products which have small weights Textiles, basic metals and alloys and chemical products which together have a weight of 34 per cent have grown by a little over 6 per cent Can it be argued that these will grow even faster because of the concessions given and lead also to an investment upswing which will lift the machinery industry out of its current depression?

Will other industry groups experience an upswing because of the changes initiated? Are new investment plans going to be made because some costs have gone down and the profits of some companies will experience a sharp rise because of the 5 per cent cut in corporation tax (According to the financial press ITC is one of the biggest beneficiaries of this cut) Will this lead to a rise in overall demand which will usher in the recovery process? This may not happen at all and an alternative scenario may develop Private industry in this country has always cued itself to government expenditure so far as investment is concerned This mindset was evident from the admonition administered in the post budget TV interview by Manmohan Singh to a business executive who asked why government spending had not been pitched higher Therefore if the development expenditure of the government is only marginally higher the reduction in costs may not lead to any upward revision of expectations

Also there are a number of factors in the liberalisation process which have increased uncertainty in the system While reduced customs duties make imports cheaper by the same token they increase foreign competition to domestic producers The inflow of foreign capital has led to new alliances, mergers and takeovers and thereby increased uncertainty—a situation not conducive to greater new investment in many areas Opening up the economy has meant that relatively small high cost and technologically backward Indian firms have to face large internationally competitive firms Adjusting to the new environment is bound to be difficult and time consuming particularly when we have other institutional impediments like the absence of an exit policy inability to reduce excess labour, etc Besides this process of adjustment to global competition takes time as the finance minister himself has stated He, however seems to think that such an adjustment has already occurred which is debatable To expect that in such a situation cost cuts will lead to an investment upswing might well look not like a calculated risk but a triumph of hope over discretion!

IV

Suppose the gamble does not pay off, what happens then? Development expenditure gets cut and the budget deficit becomes smaller We will have stability but no or low growth Alternatively—the finance minister seems to prefer this route—nothing is cut so that the fiscal deficit reaches, say, the same level as in 1993-94, i e, 7 3 per cent of GDP The budget deficit will exceed Rs 6,000 crore and the money supply which probably will have increased more than 15 per cent by the end of this year will swell even more To control the resulting inflation we may run down food stocks and foreign exchange reserves We will then have the worst of all possible worlds not enough growth, rising prices and reduced manoeuvrability in the coming years As the interest burden will be more than half the revenue expenditure, much harsher fiscal discipline than when Singh took over as finance minister and low growth will be our lot for quite some time

The budget speech makes it amply clear that the finance minister knows all the right answeres that continued market borrowing is not good because it raises the interest burden to unsustainable levels that continued deficits financed by the Reserve Bank are not in the long term interests of the economy that subsidies should be contained that assets created out of borrowed funds should create adequate debt serving capacity, and that sale of assets should lead to extinction of debt and not to financing current expenditure He has promised that all these goals will be pursued next year onwards Why could he not have put into practice all these good things in this budget? After the budgetary debacle in 1993 94 could he not have cut non development expenditure whenever possible instead of scoffing at the little saving that could be made not given those concessions in direct taxes and contained the fiscal deficit? If revenue buoyancy is not realised and if for some reason or the other he is unable to contain non development expenditure as in 1993 94 we will be facing disaster The answer to such a question seems to be in the nature of our society we always want a free lunch except when we have our backs to the wall

I have always felt that what this country needs is not an economic expert as finance minister but a wizard His task is to tax nobody but spend as much as is needed to achieve growth alleviate poverty, generate employment minimise inequality, reduce regional imbalance and generally turn India into a modern nation by the year 2000 However, all this has to be done with stable, if not falling prices Let us hope that Manmohan Singh will turn out to be such a wizard!

Bahujans as Vanguards

BSP and BMS in Maharashtra Politics

Mahesh Gavaskar

In its bid to grab parliamentary power, the BSP has reduced the plural modes of contestation to a unidimensional offensive, failing to take into account regional variations. The BMS, in contrast, is attempting to give its movement a broader historical base through an exploration of negotiated patterns of cultural change.

AFTER making a significant dent on the electoral politics of Uttar Pradesh, the BSP supremo, Kanshi Ram, has rested his eyes on the south. Within a span of two months he held three rallies—one in Bhiwandi and two at Shivaji Park in Bombay. The recent one held at Shivaji Park on March 15 overlapped with a demonstration-cum-show-of-strength organised by the Bahujan Maha Sangh (BMS) at Kala Ghoda, Bombay. The BMS, a regional political formation working in close association with the Bharatiya Republican Party (BRP) led by Prakash Ambedkar, was formed in February 1993 and in the summer of that year its candidate won Kinwat legislative assembly seat, defeating Congress and BJP contestants. Since both BSP and BMS aim at consolidating the same social base, the simultaneous occurrence of the two rallies generated interest as to who mobilises more bahujans beneath its flag. Incidentally, on March 13, the RPI (Athawale) too held a rally at Shivaji Park to felicitate Sharad Pawar for bringing about the 'namvistar' of Marathawada University. Whatever the speculations regarding the attendance at the three sites, one note is clear: the bahujans, with their rapid political conscientisation since the Mandal unveiling, are now a highly contested terrain.

Emerging Theme

A couple of years ago the hindutvavadis were riding the crest of political wave and had succeeded in making religion and secularism the pivot of political debate. Now, under changed circumstances, caste is becoming a metanarrative of the Indian politics. Already the uproar over the Mandal had revealed the caste base of Indian bourgeois capitalism; now, the dalit-OBC coupling has exposed the caste base of Hindu nationalism. In fact, the metanarrative may do more. It may unmask the Congress and the Communist Parties as hide-outs for brahminism. It may dismantle the class base of trade unions and breed caste-based unions as an effective barricade against the privatisation drive.

The political potency of the Mandal report is gradually unfolding. The grouping of diverse, numerically small castes under the overarching category of the OBC has resulted, to use Gramscian terms, in a shift from the war of position to the war of movement on the Indian political map. No more does Kanshi Ram or Prakash Ambedkar talk of alliance with established parties. Self-respect and self-reliance are the catchwords. While Kanshi Ram, in his newly gained confidence, dismisses reservations as crutches, Ambedkar talks of contesting 288 Maharashtra assembly seats. What has given charm to this rhetoric is the fact that a non-Congress alliance slayed the hindutvavadi dragon in the heart of the cow-belt. In retrospect, the hindutvavadi frenzy has played a catalytic role in galvanising the backwards under a non-Congress banner. This aura of independence is being capitalised upon by Kanshi Ram and Ambedkar. A slogan of the BMS says: 'Bhik Nako Sattechi! Satta Havi Hakkachi!!' (We spurn the crumbs of power! We demand our rightful share!!). Twenty-odd years after Dalit Panthers' frontal attack on Congress lordship in the state, once again the 'chavni' (camp) has begun to move. This time more united and more numerous.

In contrast, Ramdas Athavale's felicitation of Sharad Pawar exposes him to the danger of being seen as a vassal and a mendicant. Kanshi Ram's success has whetted the political appetite of the backwards. Given the rise in their self-esteem, the upper caste identity of the benevolent Congress leader can prove to be a liability rather than an asset. In fact, the swiftness with which the issue of namvistar was resolved, given that it was pending for 15 long years, showed that the decision was more a political rescue operation of Sharad Pawar than a fulfilment of an agenda for social justice. Buffeted by winds of change from within and without, Sharad Pawar, a skilled manipulator, recently inducted Babanrao Dhakane, a vanjari, into the party-fold. Arun Thakur coins Pawar's move as an attempt to build 'Madhav Sena' (Ma-dha-v: malis-dhangars-vanjaris) wherein Chhagan Bhujbal, Shivajirao Shendge and Babanrao Dhakane represent the three numerically dominant, landowning castes from non-Maratha communities of Maharashtra. This move is in tune with the history of state Congress which up till now has progressed by making strategic co-optations to ensure stability of its government. On the other hand, the BSP is reported to be concentrating on kunbis, kolis, bhandaris and agris—the last three being non-agricultural communities. A significant feature of these communities is their militancy, nurtured by Shiv Sena over the years. Kanshi Ram aims to capture this base and channelise it for his own firebrand politics. If this happens, Shiv Sena will be left lame, and this can push it further in the extremist direction.

Subversive Principle of Enumeration

Sudipto Kaviraj, commenting on the structural change in cognition that accompanies the transition from traditional societies to modern nation-states, labels the former as fuzzy communities and the latter as enumerated communities. The fuzzy communities, he remarks, "...did not see historical processes as things which could be bent to their collective will if people acted concertedly on a large enough scale. Since they did not ask how many of them were in the world, they could not consider what they could wreak upon the world for their collective benefit through collective action" (1992:55). In contrast, the numerical notion directly feeds into the concept of nation. In India, three sources can be identified which promote numbers as a major part of argumentation: (a) the census, introduced by the British administrators, objectified for the natives their strength in numbers; (b) the electoral politics, based on simple majority, further institutionalised the game of numbers in the post-independence era: (c) the reservation policy, besides enrolling numbers on the side of social justice, added the dimension of proportional representation. The statements of the bahujan leaders reflect the polemical mileage that can be garnered from these sources of numerical discourse.

The consequence of clubbing numerous castes under the OBC category is the conception of a homogenised block of 52 per cent of voters. This demographic giant, if mobilised, becomes a numerical capital confronting the cultural and financial capi-

tal of 'jat-dandge' (caste bullies) and 'dhan-dandge' (wealthy bullies). Already the BMS has termed the 27 per cent reservation quota sanctioned by the Mandal Commission for 52 per cent OBC population as 'half-justice'. It aims to amend the related clause in the Constitution and deliver full justice, tallying the quota with the OBC proportion in population. Numbers can also be employed to erect sharp contrast between assumed and actual positions. Thus, the Congress absolutism in Maharashtra can be reduced to a dynastic rule of mere 137 households. The incongruity can be projected by recounting that 50 lakh vanjaris have two MLAs, 80 lakh dhangars have one MLA, while one crore malis have just one ministerial berth. On the other hand, one per cent deshmukhs have four to five ministers and numerically equally insignificant patils have 10-12 ministers with key portfolios [Pawar 1994:11]. Such argumentative twist renders the universalistic claims of the Congress regime into a particularistic deshmukh-patil raj.

Disturbing Portents

Yet, unanimity does not prevail on the bahujan front. The BSP and BMS differ as to where to draw the line of essential contradiction in a society seething with caste tension. The BSP harks back to the pre-Poona Pact days when Ambedkarism had just freed itself from the illusion of emancipation within the Hindu fold and was burgeoning into a militant posture. The BSP looks upon the Poona Pact as a scalpel that cut short the life of a genuine revolution. The recent statements of Mayavati, the general secretary of BSP, labelling Gandhi as an enemy of dalits, stems from this belief. The point of interest would be as to how far the BSP succeeds in making the OBCs accept this view. For, in the Hindu society cultural deprivation has been a graded phenomenon and hence the felt-needs of the OBCs need not necessarily be coterminous with those of the dalits. The recent incidents in UP which exposed the casteist venom that the OBCs have for the dalits caution against a simplistic solution based on sharp polarities Notably, the BMS takes a sagacious stand on this issue. In its attempt to be literally majoritarian, it not only includes Gandhi among its revered figures, it also acknowledges the contribution of the 'varkaris' and the sufis of medieval times. This highlights its bid to search for deeper historical roots and for an acceptance of negotiated pattern of cultural change.

Moreover, in the Maharashtrian context Gandhi becomes a potent symbol for rallying secular forces against communal propaganda. Gandhi, assassinated by a Poona brahmin, proves handy in stigmatising the Sangh parivar in public eyes. Kanshi Ram, in his zeal to actualise the dream of Babasaheb, walks roughshod over political traditions of Maharashtra. His brazen national sweep will have to take into account the regional variations. Kanshi Ram's single-minded march to power may enthuse many a sympathiser of the downtrodden but his style of functioning is based on a myopic view of Ambedkar's vision. Ambedkar did exhort the downtrodden to become the ruling class of the country but beneath this exhortation lay a cognisance of a protracted struggle on various fronts. Kanshi Ram's naked bid to grab parliamentary power reduces the plural modes of contestation to a unidimensional offensive.

The Left Response

The left parties, too, held a demonstration on March 21 at Kala Ghoda, Bombay. But their goal was different. Five left parties—CPI, CPM, Lal Nishan (Bhosale), Satyashodhak Communist Party and PWP—gathered under the banner of Shramik Sangharsh Samiti to mobilise rural unorganised labour against the impending ratification of the GATT agreement in mid-April. As expected, the rally addressed the working class identity of the gathered masses. It mentioned them as anganwadi workers, sugarcane cutters, EGS and forest labourers, agricultural wage earners, etc. Interestingly, the social identity of this rural unorganised sector is prominently lower and middle caste in nature. It was this identity which the BMS leaders prioritised during their rally a week before. The identification of the masses in ethnic terms carries an emotional reward. It helps maintain a continuity of identity across diverse civic spaces. Thus, the absence of a dhangar in the cabinet can be made to designate the unimportance of dhangars in the overall decision-making process. Further, allocating the portfolio of animal husbandry to a dhangar reinforces the traditional occupational role, and this factor can be exploited to question the progressive image of the Pawar government [Pawar 1994:11]. The rhetoric based on primordial identities generates an immediate semblance of participation/non-participation in power structure. This sentiment can be especially acute in case of the backwards. For the relationship between the macro 'Hindu' identity and the micro caste identity becomes more and more parasitic as one descends the caste ladder. Thus, a totally different mentality operates at the lower orders of the caste society. Kancha Ilaiah articulates this cleft as follows: "While the educated upper castes feel very strongly about the Hindu identity in the context of the contending multi-religions in India... the feeling of the educated lower castes about their caste identities within the Indian market and power domains is even stronger" (1994-669). The left's rhetoric lacks this cutting edge.

The left has extended a cautious welcome to the BMS. It appreciates the BMS and BSP for having effectively politicised the materiality of culture and stemmed the tide of hindutvavadis [Desai 1993, Pansare 1994]. It envisages this development to prove beneficial in popularising the left's 'janwadi' politics. In the present context, where the local and the global are getting rapidly juxtaposed, the left has a crucial role to play in shaping the subaltern politics. Social groups, which have recently gained consciousness of their position in history, find themselves variously relativised in a globalised culture. Modernity has resulted in an existential dilemma for them. They approve of the economic benefits accruing from modernisation but want to resist its cultural advance. This has made them search for roots either apolitically, as in the case of Adivasi Ekta Parishad, or politically, as in the case of the BMS. Yet, making caste the basic unit of mobilisation need not mean justification of all its accoutrements Arguing for the validity of 'jati' panchayat, just because caste gives social mooring, is a case in point. The left, with its sharpened tools of historical understanding, needs to critically intervene and prevent the exploration from being merely formal.

Atrocities on Dalits in Gulbarga

Upper Caste Hold on Police

Ambrose Pinto S J

The resurgence of the dalit movement in Gulbarga district of Karnataka has resulted in growing upper caste violence on the dalit with the police playing a partisan rôle and ignoring dalit complaints.

THE dalit movement has grown rapidly in Gulbarga district where dalits form 25 per cent of the total population according to the census of 1991. The maximum number of atrocities in Karnataka on the dalits have been in Gulbarga in the last two years.

The dalits have come to realise that there is a price to be paid for asserting their right to equality. Rights are never given. They have to be fought for and a price has to be paid for it. To the extent the dalits carry on their age old professions and do not question their caste masters, there is peace in dalit colonies. But the moment they refuse to continue with their hereditary occupations they incur the wrath of their caste masters. Take the case of Malkappa who was made to eat human excreta on November 3, 1991 in Busanur (Gulbarga). His only fault was that he refused to cut firewood. Though the police arrested Shivayya Guthedar, the culprit and a COD enquiry was ordered there was no further action. Guthedar was freed in no time at all on account of his connections to those in power. This is the same pattern of behaviour at Alagi (B) another village of Gulbarga. It was customary for the dalits to sacrifice buffaloes every year at the Laxmi Devi festival of the caste Hindus. But on instruction from Bhimsa, the dalit panchayati member, dalits refused to perform the sacrifice in June 1992. The caste people were informed of the dalits' decision two days prior to the festival. The caste people issued death threats to the dalits. Although the deputy commissioner and superintendent of police were informed of these threats to dalit lives, three leaders of the anti-buffalo movement–Bhimsa, Gurappa and Baksara were murdered, on June 3, 1992, the day of the festival in the early hours in the presence of the circle inspector of police and police forces. The murders were discussed in the legislature and crocodile tears were shed. In spite of the announcement in the assembly of the suspension of the circle inspector of police, he continued to be on duty. None of those involved in the murders have been punished.

Acquisition of land by dalits is another source of conflict. For the landlords and zamindars, dalits are cheap labour. When they buy land or are given government land, the labour situation significantly changes in the villages. The dalit come to acquire strength. Caste groups resist such attempts. Gurulingappa of Shamnur village was murdered on October 2, 1993 for buying five acres of land. The lingayats and BCs of the taluk had opposed Gurulingappa's acquisition of land. The dalits knew that there was going to be violence, once Gurulingappa bought land. But Gurulingappa was an employee of the police and he thought that because of his closeness to the police personnel he would be able to get police protection and went ahead huying the land. The DC and SP were given a complaint a month in advance by both Gurulingappa and the Dalit Sangarshan Samithi (DSS) about the danger to Gurulingappa's life. Yet the administration took no preventive measures. No arrests have been made as yet and no compensation given to the family.

The DSS is an articulate and widely representative organ of the depressed classes in Karnataka. Started by untouchable youths, it is in its fifteenth year of existence. The movement has highlighted atrocities on dalits. Dalits have been made aware of their basic rights of equality and justice in remote corners of the state. In the process of conscientisation, the dalit power has been awakened causing a major rift between dalits and the upper castes.

At Yadgiri, Dandappa, a dalit had bought two acres of land. The upper castes were quick to encroach on that land. The SP and the DSP in spite of complaints from the DSS, filed a case against Dandappa as an anti-social after being given a bribe from the upper castes. The case is still going on. At the nearhy village Yamunappa and Shankarappa had four acres of land each. They have been cultivating the land for 10 years. When applied for regularisation, the caste people objected to it and threatened the dalits with consequences. In Tollasanahalli of Chittapur taluk, government land was cultivated by dalits. The land was annexed by vokkaligas. The upper caste want no change in the situation of SCs and STs. Any attempts to empower them by measures such as providing land and property is resisted by the upper castes.

Whenever the dalits have stood up as equals they have invited the wrath of caste Hindus in Gulbarga. Gundappa's body with wounds was found in a well in December 1992. The post-mortem report was that it was a natural death. The administration expediently linked it up to the Ayodhya episode. Huliguppa's murder at Vadi under mysterious circumstances is yet to be investigated in spite of a written complaint to the DC and SP from the DSS. Jayanth, the tractor driver of the local landlord was murdered. The version of the landlord was that Jayanth's death was accidental. After postmortem the body was taken for cremation and the parents of Jayanth were informed of the murder. Why should Jayanth have been cremated when the normal practice among the dalits is burial is a question that would not find an answer. The post-mortem report describes it as an accidental death. On October 23, 1993 Mariappa, a lorry cleaner was murdered. There have been other such deaths that have not come to the notice of the DSS. The DSS has filed complaints in each one of these cases to the DC and the SP. Yet none of these cases are investigated and none will be.

Encroachment of government or public land by caste Hindus is a common phenomenon in Gulbarga. At Hagara Gundige the dalits had applied for a piece of land years ago for the construction of Buddha Vihar. The site is close to the dalit colony. Yet when the dalits attempted to build the Vihar for their activities on December 6, 1993 on Ambedkar Jayanthi they were attacked and assaulted by caste Hindus.

Two dalit houses were burnt, 11 dalits were injured and eight houses were damaged. At Pet Ammapur it was a demand for a cup of tea by a group of youngsters in the public restaurant that provoked the wrath of the caste Hindus. One dalit was murdered, six were injured and 11 huts were burnt. The village imposed a social boycott on dalits. They were provided with no coolie work, no provisions in the shop were sold to them and they could not draw water from the public well.

To protest against the total indifference of the district administration to atrocities on them DSS organised a novel 3,000-strong half naked peaceful procession on January 24, 1994. The administration determined to break the DSS backbone; came well prepared to handle the situation, with full police force. On flimsy grounds that the processionists were insisting on a particular route for the procession which was a security hazard, the police resorted to severe lathi-charge. Over 100 DSS volunteers mostly students were beaten up and 11 were seriously injured. The police later forced entry into the Jagajivan and Ambedkar student hostels and picked up the students at will and beat them up before taking them away. The dalit students were beaten up at the bus stand too. In all 127 students were arrested, taken into custody and charges were filed after brutally assaulting them. They were released on bail after two days in police custody. According to the victims, the police called them one after the other, beat them up on their legs, heads, backs, and private parts till the victims became unconscious.

TABLE 1: CASES OF CIVIL RIGHT VIOLATION AGAINST DALITS IN GULBARGA

Year	Cases Registered	Cases Punished	Cases Over
1990-91	85	—	—
1991-92	69	—	—
1992-93	49	—	—

When Ambarayyan asked for water when he became conscious, he was told he would be given urine. Many of those who have been beaten have fractures and wounds still on their bodies. Two have become handicapped for life. In the case of Ramesh Kumar, as soon as his sick mother saw him returning from the police station two days after the arrest she died from shock on seeing his wounds.

Nexus between Police and Upper Castes

The DC of Gulbarga is Ashok Kumar Manoli, a dalit. So is sub inspector of police Kattimani. Yet these police officials could not protect the interests of their own people. Both have been 'co-opted' by the upper castes. In fact the two officials are detested by the dalits and the DSS. At the lathi-charge and later at the third degree punishment meted out to DSS workers at the barracks these two police officials were actively involved. According to the DSS the procession was a peaceful one and the pelting of stones was done by the people hired by the police. A huge police force was brought to Gulbarga that day to crush the dalit power. That the whole police administration is closely aligned with caste interests is clear to the dalits. Even those who were from their own ranks meant to safeguard their interests, once in office, conveniently bypass them. Then there was the director of social welfare Kantappa whom we had a chance to meet. He is in-charge of SCs' hostels. Yet when the police entered the hostels, he was bypassed. Though he possesses a great love for his own people and was quite sad at the events, he has not been able to take an independent stand on behalf of the DSS. He looked quite helpless, confused and unable to assert in the interest of his people.

A question worth pondering is whether those who through reservation have occupied the seats of power as representatives of the oppressed groups will ever be able to represent their own class interest? Some one in power are co-opted, others find themselves quite helpless, given the socio-political structure. It is a fact that many dalits once in power do not want to associate themselves with their own people. Ashok Kumar Manoli, the DC is a good example. An efficient bureaucrat, he has married into the brahmin fold and his attitude is typically brahminical. The other police officials in Gulbarga are no different. On the other hand the director of social welfare has been taken for granted by the establishment. Being weak, he has been a mere spectator to the events incapable of making any interventions on behalf of his people.

Dharam Singh, the social welfare minister visiting Gulbarga soon after the police atrocities went to the two hostels from where dalit students were forcibly taken. The minister pulled up the superintendent of the hostels for permitting the police to enter the hostels and beat up the students. The superintendent said that he was not in office when the police arrived. As soon as he came to know about it, he had complained to the SP. The minister promised to take action against officials who entered the hostels without permission. The DSS wanted the suspension of the DC Ashok Kumar Manoli, CPI Balakrishna Badigere, sub inspector Kattimani and SP Jeevan Kumar Gaonhar. Dharam Singh promised to look into the demands, and to examine all cases of atrocities against dalits in different villages of Gulbarga and assured punishment to the guilty.

Later at a press conference, Dharam Singh said that the civil rights enforcement cell in the state would be strengthened. While releasing Rs 80 lakh, he assured sufficient staff, vehicles and equipment for the cell. Gulbarga district was identified as sensitive and a mobile squad was posted there. Orders were given to the police administration to screen all the 127 arrested students and release the innocent among them immediately.

An assurance was given to the DSS that a senior police official would be deputed to investigate the lathi-charge. Accordingly the director general of police (crimes and training) F T R Colaso DGP and the deputy inspector general of police, civil rights enforcement cell Srinivasan were sent to Gulbarga to enquire into the police-dalit tussle and the increasing incidents of atrocities against SCs. Within a few weeks the minister promised a meeting of ministers, legislators, MPs, prominent political leaders, DSS and social activists to discuss the cases of atrocities against dalits in the district.

The chief minister visited the place. An amount of Rs 21,500 was disbursed towards the loss of property to 10 victims at Pet Ammapur. At Kudala Hangarga Rs 34,200 was disbursed to five families and Rs 23,000 to 10 persons at Hagargundagi. At the assembly tears were shed at the loss of lives and property of the dalits in Gulbarga. With that the Gulbarga dalit problem was given a burial. At the time of the crisis the government makes numerous promises. Once the crisis is over the state fulfils none of these promises.

The Police Response

As a first step to appease the DSS, Badigere the CPI and Kattimani the SI were asked to go on leave by the government. But the policemen were quick to act. Over 200 of them went on a snap strike for more than two hours protesting against the government order of sending the two police officials on leave. Mallikarjuna Kharge, co-operation minister condemned the snap strike. He wanted the policemen to ventilate the grievances to the government through proper forum instead of going on a snap strike. He alleged that the police were trying to suppress the dalits' protest against atrocities committed on them and hold the government to ransom. Gundappa Korwar, Rajya Sabha member condemned the strike by police. The striking police termed the reports on dalit atrocities as false and biased.

Later the social welfare minister and Krishna Bhat, the police union leader held a discussion. It was not clear what transpired at the meeting, but both the minister and Krishna Bhat denied that the police were on strike but could not explain how exactly the incident of policemen deserting their station *en masse* could be described. The two officers were back on duty. The order asking them to proceed on leave was rescinded. The police in fact had called off their strike following the withdrawal of the orders against the two officers. Soon after, the police also took out a victory procession. The government looked helpless and easily gave in to the brutal police demands. While the dalits are not given their legitimate right to protest against atrocities committed on them through a march, how is it that the police managed to get support from the establishment for their heinous crimes and illegal procession?

The two senior officials F T R Colaso DGP and the deputy inspector general of police Srinivasan who conducted the inquiry gave a clean chit to the police. The report justified police lathi-charge. In a press conference, the DGP even observed that more police were injured in the incident than dalits. There is no truth in police excesses, Colaso observed. It was without doubt a partisan report to protect the police force. The key player in the whole game is the DC Ashok Kumar Manoli. Bent on destroying the DSS movement and his own people he is much involved in dividing the dalits. While submitting totally false reports to the government on all the incidents where dalits have been killed and wounded, he has projected himself as an upright officer. According to the DSS, he has bought up people, paid for false witnesses and acted against dalit interests.

In the midst of all this, the DSS strategy of struggle has been admirable. In spite of the lathi-charge, they continued their struggle in an organised manner. Whenever they have perceived threats to their lives by upper castes, the DC and the SP have been informed, though they have failed to provide them with necessary protection. Wherever there was a death or assault on the dalits the organisation has filed a complaint at the police station and obtained a receipt. All the protests and the measures of the DSS have been constitutional. In a society when caste laws are more

Table 2: Cases of Atrocities against Dalits, January-February 1994

Month	Cases Reported	Cases Investigated	Final Report	Still under Inquiry	Cases Punished
January	53	29	9	17	—
February	41	16	3	22	—

powerful than constitutional laws, they have of course not been able to obtain justice.

In Gulbarga, while trying to define the dalit identity outside the Hindu fold, the movement has provided much needed courage and inspiration to ordinary dalit men and women in remote corners of the district to stand up for their dignity as human beings. While the ordinary dalits still celebrate some of the Hindu feasts and festivals, the DSS as a whole is moving away from Hinduism, a religion responsible for their untouchability to 'Ambedkarism' and 'Buddhism'.

Most of those against whom lathi-charge was made and those who have died among the dalits have been their leaders. Police and the caste people have targeted the leadership to crush the movement. Yet with a view to build up a strong movement the educated have united with the impoverished majority of their own community. To broaden the social base for revolt all sections among the dalits—the holeyas, madigas, chaluvadis, dhors, jhadamales and others—have come together. They are becoming proud, assertive, independent and active in their own cause.

In all the cases of death and damage the government was quite eager to win over the DSS by paying paltry compensation to the victims. The DSS has not been keen on monetary assistance but on getting the culprits booked. With the whole system against them, will its cries for justice be ever heard? A section of the dalits are painfully realising that the state is not going to look after their interests. It will continue to oppress them if they do not rise against it as one people. Constitutional methods are meant to delay and gradually deny justice to them. They have sufficient evidence to the fact. At the directorate of social work, Gulbarga, the figures of civil rights violations for 1990 to 1993 were available (Table 1)

The DC claims that the cases relating to civil rights violations and atrocities have decreased. But those who knew the situation in Gulbarga hold the opposite view. Cases have gone up, but dalits have lost faith in the state. If the cases have not been reported it is because they have lost faith in the capacity of the state to provide them with justice.

The message is clear to the dalits. The state professes to be on the side of the SCs/STs, weaker sections and the oppressed groups. Laws are enacted against untouchability and providing land to the landless. Special schemes under 'Aradhana' and housing are initiated for the benefit of marginalised groups. There are constitutional provisions for the empowerment of the socio-economically oppressed groups. But none of these are translated into action. The reason is simple. In spite of its loud pronouncements the state serves the interests of the upper castes and classes. There is a close nexus between caste and power in the state.

What is the alternative left to the dalits? As a result of the DSS demand, a judicial probe into all the atrocities against the dalits has been ordered. The report is to be out in three months. Is not this one more state gimmick to cheat the DSS? Those who have aligned themselves with the state will never be punished. Yet the DSS has accepted the probe. What is tragic is that the committee set up has been constituted with no reference to dalits. The DSS as a well organised political movement may rest by constitutional means when they know the Constitution, the courts and the administration does not provide them with justice.

Viability of Rural Bank Branches

Analyst

The income tax rebate available to banks at the rate of 4 per cent of average rural advances has been raised to 10 per cent in the current year's budget. This has tremendous implications for rural credit expansion as well as the overall post-tax profitability of banks.

THIS note has reference to an earlier letter (*EPW*, August 21, 1993) in which it was mentioned that the profitability of rural branches has received a big boost with the income tax rebate available for banks at the rate of 4 per cent of average rural advances from the year 1993-94 as against 2 per cent rebate allowed earlier. In the current year's budget the tax rebate has been raised to 10 per cent of average rural advances with effect from April 1, 1995. This has tremendous implications for rural credit expansion as well as the overall post-tax profitability of the banks. Its result will be that banks which expand healthy rural credit will report very high post-tax profit and profitability.

For analytical purposes, we may make some calculations based on the rural advances of banks given in an earlier study ('Myth of Non-Viability of Rural Branches', *EPW*, May 1, 1993). The tax rebate for the year 1991-92 was 2 per cent of average rural advances plus 2 per cent of gross profit made during the year. The sum of these two items was lower than the other route for tax rebate, namely, bad loans written off, and consequently the rebate provision based on rural credit was not made use of. For calculating the post-tax profitability of branches (grouped by population), the income-tax paid for the year may be distributed amongst branch groups according to their contribution to pre-tax profits. Using the same methodology, we may work out the post-tax profitability of branch groups taking the enhanced tax rebate of 10 per cent of average rural advances. The tax rebate at 10 per cent of rural advances far exceed the gross profit of rural branches. For analytical purposes, the excess tax rebate is also treated as income of rural branches and the amount has been proportionately deducted from the gross profit of branches in other population groups. By this method we may arrive at the post-tax profit of branch groups, as shown in the accompanying table.

With the tax rebate the post-tax profitability of the bank goes up to 1.24 per cent and those of rural branches to an incredible 4.97 per cent. We have worked out these figures on the basis of 1991-92 business figures when rural credit constituted 21.5 per cent of total credit. If by 1995-96, the share of rural advances could be raised to 25 per cent even as total credit remains unchanged, the overall post-tax profitability of the bank will go up to 1.31 per cent which is very comfortable. By 1994-95 the bank would have met the accumulated provision needs leaving only the normal annual provision which may be taken at 0.6 per cent of average loans or say 0.3 per cent of working funds. This leaves a net profit of 1 per cent of working funds for appropriation to reserves and payment of dividend to shareholders.

In this perspective, for the medium-term the crucial task before the public sector banks is taking steps to enhance productive rural credit. Looked at from this angle, it goes to the credit of a bank such as the Punjab National Bank that, notwithstanding the banking industry's general demand for reduction in priority sector credit or closure of rural branches, its Corporate Plan for 1995-96 recognised the importance of priority sector credit for the profitability of its rural branches as well as the bank as a whole. The plan included strategies for boosting priority sector credit in general and direct agricultural credit in particular. But transforming that goal into reality is not an easy job. Banks have to undertake many innovative practices to enhance the flow of productive rural credit. The earlier strategy of compulsory target lending will not yield the required results.

Union Budget and Decline in Educational Effort

K S Chalam

The budget proposals and the budget rigidity towards education in the central sector might bring educational inequalities in the long run because they indirectly encourage private sector growth in education.

THE government budget is an annual statement of public expenditure and revenue envisaged for a financial year. It is a process "through which the wishes of the electorate are translated into concrete projects and programmes designed to satisfy the demands for public goods". It is a cycle through which continuous process of expenditure for various government projects are proposed to be approved and ultimately executed. Therefore it contains in-built mechanisms like taxation to initiate structural change and provide broad directions of development.

The preparation of the union budget and its presentation in the parliament attracted great significance when Manmohan Singh took over the portfolio of the finance minister in June 1991 under exceptional circumstances. He has created a sense of confidence and brought unbridled economy under control through various macro-economic policy variables. He has introduced the so-called structural adjustment model (SAM) which consisted of three main elements, namely, exchange rate adjustment, fiscal correction and structural reforms in the area of trade and industrial policy. The main concept which was significantly discussed during the budget and also in post-budget deliberations was the concept of gross fiscal deficit. The concept of fiscal deficit "reckons the total resource gap in terms of excess of total government expenditure over revenue receipts and grants. This concept fully reflects the indebtedness of the government". It was envisaged that the fiscal deficit would be reduced by 2 percentage points from 8.4 per cent of GDP in 1991-92 to 6.5 per cent of GDP during the year 1992-93 and it would be further reduced to 5 per cent thereafter. This deliberate policy of the government reduced the fertiliser, food and other kinds of subsidies that were given by earlier governments. The immediate next year created a sense of complacency among the government functionaries as the policy was really creating some results. In this context the government was not conceding to any kind of criticism that the reduction in expenditure on social sectors would further deepen the inequalities and poverty. Human resource development was not considered at that time as a priority area though the same government modified its National Policy of Education in 1992.

The concept of human resource development takes into consideration sectors like education, health, family welfare, employment, nutrition, etc. Here, we concentrate only on education as it is a major sector that come under human resource development. There is a marked difference in the current budget formulation towards priorities of the economy and society. The simple manner in which the budget was introduced by Manmohan Singh with lot of transparent concern for the social sectors indicate that there is some political element in the budget-making as the current year is an election year in five major states in the country where non-Congress governments are in power. However, the shift of emphasis from purely liberalisation, globalisation mode to that of helping the middle classes appear to be an important departure. If one links the speech delivered by the prime minister Narasimha Rao at the World Economic Summit and the present budget, it is clear that the rigour in the profound belief in the market appears to have decelerated and the peculiar socio-cultural realities of the country seem to have attracted the attention of the prime minister and the finance minister in making the present budget. Perhaps it may also be due to the postponement or temporary elimination of the political and economic crisis which the present government had encountered when it came to power in 1991. Therefore the present budget has made some popular moves in the social sector that attract the attention of middle class opinion-makers. But the policy of liberalisation which was initiated in the previous years in the education sector like that of privatisation and capitation colleges may not really help the people to get these declared benefits.

Educational Concessions

The amount of concessions that the finance minister announced for the education sector during the year 1992-93 and during the current budget include: (1) 100 per cent tax rebate on the contributions to recognised educational institutions, (2) Tax exemption to the extent of Rs 25,000 per annum on repayment of educational loans including interest up to a cumulative total of Rs 2 lakh, and (3) 5 per cent cess on imported technology for the development of R and D. These concessions are applicable to higher education. The constitutional obligation of providing free and compulsory education to all in the age group of six to 14 years has remained as an elusive ideal. After realising this problem, perhaps the prime minister who is a former HRD minister has announced recently that the government is committed to spend 6 per cent of its GNP on education. The 6 per cent GNP syndrome has been attracting the attention of various categories of people for the last one decade, ever since the Kothari Commission envisaged that 6 per cent of GNP be devoted for education by 1986. Even this figure is arrived at by the Kothari Commission under the assumptions of a population growth of 1.5 per cent and the rate of growth in national income of 7 per cent and per capita expenditure at the rate of Rs 75 by 1986. This is a controversial figure as the 6 per cent of GNP can be either public expenditure or public and private combined. In fact the total central and state government expenditure on education plus the private individuals' expenditure on education constitute around 6 per cent of GNP by 1990. The Kothari Commission projected this figure in 1966 assuming that the per capita expenditure would be Rs 75 in 1986 in current price and Rs 54 per capita in constant prices. But the fact of the matter is that the per capita expenditure in 1986-87 was Rs 112.7 in current prices. Therefore there is no sanctity in the figure of 6 per cent of GNP. However, the prime minister's commitment to the figure will bring positive results in future since the proportion of public budget expenditure on education to the GNP has still remained below 6 per cent. This may be kept in mind while arguing for more funds for the education sector. The literacy rate of the country has remained at 52 per cent and half of the illiterate population of the world are in India. Therefore, the concessions announced by the finance minister will positively influence enrolments at higher levels of education only.

Higher education in India, particularly the professional and technical component has been a prerogative of the privileged few for the last four decades. Yet, the total enrolment in the system of higher education constitute around 7 per cent of the

corresponding age group while it stands at around 20 per cent in some of the advanced OECD countries and in countries like South Korea, Japan, etc, in the Asian region The IMF/World Bank experts have developed a theoretical argument that higher education is increasingly benefiting the private individual and "unless educational development becomes less dependent on public funds, countries will not be able to tap fully the profitability of further educational investments" This rhetoric by the World Bank experts in 1986 helped the government of India to formulate a National Policy of Education, 1986 The NPE 1986 has for the first time admitted that most of the courses that are taught in our educational institutions are redundant The liberalisation process in the economy was also started more or less around this period Further, privatisation of higher education gained momentum with the declaration of the delinking of degrees from jobs Out of every hundred students enrolled in higher education 45 belong to liberal arts and 21 are from commerce The remaining 34 are admitted in different categories of sciences and professional and technical courses available in the mainstream education system But, during the last few years courses in the area of computers, electronics accountancy, etc are being increasingly offered by non formal private institutions The mushrooming of these institutions in the metropolitan centres and even in semi-urban areas is a visible change in the system of higher education in the country The number of universities and colleges have also increased during the period 1986 87 to 1991-92 The most significant part of this increase is that 60 per cent of these colleges have come up in the four states of Andhra Pradesh, Madhya Pradesh, Maharashtra and Karnataka If one looks at the management of these colleges it will be clear that most of these colleges are established with political clout and quite often with a communal overtone It is reported that teachers working in these colleges have made their way up to the college/university level even without crossing their district border Therefore the quality of education in these institutions needs to be critically reviewed by agencies like the UGC

The NPE 1986 has produced an accompanying document on 'Programme of Action' (POA) on each sector and subsector of education However this was reviewed and reviewed In July 1991 CABE appointed the chief minister of Andhra Pradesh to review the POA and it has given its report with 100 recommendations The new POA 1992 has devoted considerable part of its report to the achievements made so far and outlined future programmes in education It is significant to note that for the first time the government *Economic Survey* devoted a separate chapter to social sectors that included education The 1992-93 survey contained only 18 lines on higher education But the message in the survey is very clear The survey indicated that 'increased involvement of voluntary and private agencies' will continue in higher education In the case of professional and technical education, the government intends to support the five elite IITs and five IIMs in the country It is also indicated that the existing subsidies for higher education will be withdrawn by raising tuition fees and the distance mode is the alternative source of education for the weaker sections of the society The World Bank was approached with a major project of upgradation of polytechnics in the country wity 1 650 crore

Some of the important achievements which are likely to continue in future include the introduction of NET, enhancement of salaries and promotional opportunities for teachers in colleges and universities autonomous colleges and departments, establishment of state council of higher education, academic staff colleges development of model syllabus in 23 disciplines through centres of curriculum development, country-wide class room, etc These initiatives in the higher education system of the country it is envisaged would rejuvenate the system to reach international competitiveness and world standards There is very little that the government intends to do to raise the levels of literacy when single teacher schools are being closed for want of staff In Andhra Pradesh alone it is reported that 5 000 single-teacher schools were closed in 1993.

The World Bank/IMF structural adjustment model which has induced the government to reduce the fiscal deficit has already shown its impact on social sectors in general and education in particular The budget allocations for higher education have declined The expenditure on social sectors in real terms and as a proportion of GDP and total budget expenditure remain constant Similar conditions have been reported in other third world countries where SAM was introduced

In India the Supreme Court has declared education (including higher education) as a right of the citizen The same court has later allowed the neo-capitation colleges to emerge and collect huge tuition fees in the name of management quota along with a special provision for NRIs in the Unnikrishan vs state of Andhra Pradesh case The major thrust of this policy seems to encourage privatisation in the education sector The long-run implication of this measure is clear It creates an inequitable society by providing opportunities to those who have the money power and deny the entry into the system to others In a democratic technological society entry into power, privilege and bureaucracy is possible through higher education If the entry to the education sector is blurred, the poor and the socially and educationally disadvantaged groups will remain outside the system for ever The World Bank experts and their supporters are arguing that open learning system is thrown open to such groups It is further argued that those who do not have economic support can still be benefited by the private sector through the slowly developing credit market in higher education This is exactly what the finance minister has done in his 1994-95 budget by providing concessions to

educational loans. The intention is to create a loan market for education which the World Bank had prominently mentioned in its 1986 policy prescriptions.

The three major policy options suggested by the World Bank in 1986 for developing countries are being implemented now in India. These policies include (1) recovering the public cost of higher education and re-allocating government spending towards the level that produces the highest social returns, (2) developing a credit market for education, together with selective scholarships, especially for higher education, and (3) decentralising the management of public education and encouraging community and private supported institutions. These policy measures would largely benefit the privileged and well-to-do sections of the society as the entire mechanism of admissions is now based on the market forces. Some economists have also started using Adam Smith's classical argument that the salaries of teachers in universities and colleges be left to the free play of market forces as the output contributed by these newly recruited lecturers is not commensurate with the increase in their salaries. But the problem in third world countries is that the disadvantaged groups are not aware of the advantages of education and therefore, quite often they under-invest in themselves. It is precisely for this reason that the state is given a role to play here and invest in the human capital. Even in the advanced countries like the US, France, the Netherlands, etc, 50 to 70 per cent of the higher education enrolment is in public-supported institutions and the fees constitute less than 20 per cent of the public cost (Table 2). The remaining cost of education is augmented through several ways including private endowments. These are the countries which have achieved a minimum of 20 per cent enrolment in higher education through public support and achieved the critical minimum effort in education to provide the necessary base during their early stages of development. Comparing the leaders like South Korea in Asia is pertinent here in terms of its structural adjustment model and the educational effort made by this country. South Korea and some Asian countries have restructured their economies towards highly modern technology by producing scientific and technical manpower in the initial years through public investments. In the west, successive governments and people have already invested in their countries' human capital during the last century and early part of the present century to carry out the development process which South Korea did in 1980s. Data from UNESCO (1991) suggest that there were 50,000 technicians per million of the population in South Korea in 1981 while there were less than 800 technicians per million population in India as late as 1990. South Korea manages to have half of India's strength in R and D personnel with about a 20th of India's population. And with a GDP per capita that is nearly seven times that of India, South Korea invests 2.1 per cent of its GDP in R and D as against 0.9 per cent in India. The recent UGC Proposal to convert first degree courses into vocational stream in 100 institutes in the country is still in the formulation stage.

The concessions announced by Manmohan Singh in tax rebate for contributions to educational institutions in the previous budget and the concessions announced to students who took loans for their studies during the current budget appear to be positive and encouraging. But if one looks at the allocations for the social sectors including education during 1994-95 budget *vis-a-vis* the previous budgets, there is a decline in the allocations for the education sector. Allocations for the education sector in the revised estimates is Rs 2,644 crore for the year 1993-94 and the amount allocated for this sector during 1994-95 budget is Rs 2,623 crore (plan + non-plan). This constitutes 1.7 per cent of the total budget expenditure in 1994-95 compared to 1.8 per cent in 1993-94 revised estimates. It may be further argued that the allocations of the central government towards education constitute less than 2 per cent of the budget as education is a concurrent subject and much of the expenditure on education is met by the state governments.

The expenditure on social sectors particularly education will effect the state expenditure on education as the central grants to states have remained constant. Therefore the overall effect on the education through budget process appears to be negligible in terms of the recent budget proposals. Further the public sector disinvestment may affect the enrolment at various stages of education because of the fact that most of the public sector undertakings have been maintaining their own educational institutions and the withdrawal of the investment might affect the development of education in future. Further, investment in public sector was made possible because of the sacrifices made by the illiterate and socially and educationally backward masses by foregoing their education in the past. These investments were also made out of the savings contributed by these sections and by diverting the funds to the public sector which should have been utilised to improve the quality of human capital of the poor and deprived. Therefore, the money belongs to them. The present government has no moral right to take away the savings and sacrifices of the past generation and convert them into private investments to benefit the few privileged through public sector disinvestment. The money belongs to the socially, educationally and economically deprived sections as they have postponed their investment in human capital and also contributed through indirect taxes as consumers. Therefore, these disinvestments should go for the development of education, health and nutrition of these groups through subsidies and not to pay for the inefficiencies of the few and to safeguard the interests of the private individuals.

The concessions announced by the finance minister during the current budget in repayment of loans relate to undergraduate and postgraduate courses in medicine, or management or postgraduate students in pure sciences, applied sciences, mathematics or statistics. If this concession is analysed from the point of loanee, it must be clear that those who have some assets and are capable to repay will alone be eligible. But those who do not have the necessary wherewithal may not benefit from these concessions. It may even alienate the poor people from higher education as the value of paid seats in some of the private professional institutions amount to several lakhs of rupees and the announcement of this concession prompt the managements to strengthen their regulations for the payment of the fees with a plea that loans are now available for the economically poor. This may even motivate some of the poor but bright boys to take a loan and become a professional. They may become modern honded labourers to the banks after their education and continue to repay huge sums as loan instalments.

The proposal to collect a cess of 5 per cent on imported technology and the amount thus accrued will be kept with the department of science and technology for R and D is the most progressive step in the budget proposals. Because, this will discourage all kinds of imported technology from outside and help to indigenise the imported technology with the money available through collection of cess. This was executed hy Japan in the initial period of its development process

New Policy of Containment

Robi Chakravorti

The objective of US foreign policy from now on would be to shape the world order so that the basic structural criticisms of US interests are neutralised. This is likely to be attempted through a 'soft co-optation' of leaders and groups in the third world countries.

GEORGE KENNAN, reputed to be the founding father of the policy of containment which is supposed to have led to the decline and dissolution of Soviet Union, was recently felicitated by the Council on Foreign Relations in New York in celebration of his 90th birthday.

Kennan gave a speech which was excerpted in the op-ed page of the *New York Times* (March 14). He acknowledged that his article published in the *Foreign Affairs* under the pseudonym X had inspired the US policy of containment originally aimed at halting the expansion of Soviet power into central and western Europe.

According to his current interpretation of the original policy outlined by him over four decades ago, he views it mainly as diplomatic and political acts, "though not without military implications". He complains that instead of conducting negotiations with Soviet leaders following successful operation of the Marshall Plan and Berlin Blockade and other measures, western countries targeted the goal of 'unconditional surrender' which led to the development of consequences such as unnecessary military expenditures, development of nuclear weapons and their disastrous potentialities and the communist control of East Germany, Czechoslovakia and Hungary.

The new world devoid of threats such as Hitler, Japan and Stalin's Russia, which dominated foreign policy thinking, poses a new challenge for the US foreign policymakers. This topic dominates the writings of various foreign policy experts, offering different suggestions clothed in the morality of freedom and free market and the special place that the US holds in mixing these two concepts and translating them into policies and programmes in other countries. One must view Kennan's opinion in this context.

Kennan recommends that the foundation of the new policy be based on sound principles—"principles that accord with the nature, the needs, the interests and the limitations of our country". Then, he quotes the celebrated liberal politician of the 19th century, John Quincy Adams. The quotation is produced to support his contention that the situation that the US faces today is not new in the country's historical experience. "Similar situations," he claims, "existed in the early years of the republic and again toward the end of the 19th century."

Kennan's references to the past history of the US foreign policy are selective both in facts and their interpretation. During the early stages of the formation of the US republic, several states could be annexed or added because of the conflicts between the big powers of the time such as France, Spain and England.

The point of this criticism is to show how past history can sometimes be reinterpreted in support of the so-called new global order viewed from the US perspective, while hiding the dynamics of the contradictions between the enunciation of principles and their actual practice.

Kennan's point about preparing a new foundation for the post-cold war foreign policy is well-taken, but the stated moral basis of its operation and its historical precedent can be questioned by critics of the US policy. The dissolution of Soviet Union and the weaknesses of the Marxist utopia are important factors to be taken into consideration; but these two factors and their jingoistic assessment may lead to new forms of abuse of power for the 'needs and interests' of the country. When Kennan mentions "the limitations of our country", he is apparently suggesting a careful use of military power in future.

On the other hand, one can interpret the limitations factor as the 'need and interest' of maintaining the US economic structure facing increasing pressure for change. The pressure comes from two broad sources: increasing global competition for resources and labour, and the concomitant demands for social and economic rights in different countries taking different forms. Seen from this perspective, Kennan's formulation for a new foreign policy approach acquires a different meaning.

In this context, we can cite two documents: one relating to what Kennan himself said in a secret memorandum to the State Department which Noam Chomsky exposed in an article published in the *Monthly Review* (September 1985); the other one illustrating a historical precedent of how political moral principles enunciated by liberal intellectuals can degenerate into handy justifications for crude intervention. John Quincy Adams, whom Kennan applaudingly quotes, formulated the concept of the Monroe doctrine founded on the moral principles of self-determination in the western hemisphere which was later used as a justification for different types of intervention.

Let us examine the second illustration first. John Quincy Adams, the sixth president of the US, is credited with the creation of the Monroe doctrine when acting as the secretary of state under president Monroe who preceded him as president. Adams was a liberal in the true sense of the term. He opposed slavery.

The Monroe doctrine, since its official announcement in 1823, remained the moral basis of American foreign policy for over a century. While the doctrine was preached on the moral grounds of the right to self-determination in the western hemisphere, its interpretation shifted to suit what Kennan now describes as the nature, needs and interests of the US. President Polk in 1845 interpreted it as the right of the people of the western continent to decide their own destiny. Teddy Roosevelt in 1904 declared that the US was an 'international police power'. Teddy Roosevelt, interestingly, was also associated with the policy of the 'big stick' in the Caribbean area and 'dollar diplomacy'. In 1912, senator Lodge carried through Congress a resolution extending the Monroe doctrine to non-European areas like Japan. Instances of US intervention in early decades of this century are numerous, such as in Haiti (1915-34), Santo Domingo (1916-24) and Nicaragua (1912-33). These interventions took place before the emergence of the fear of the Nazi devil followed by the communist devil.

According to historian William Appleman Williams (*America Confronts a Revolutionary World*, 1776-1976), the postulates of the Monroe doctrine were later extended as the Open Door policy applied to Asia and the rest of the world using "the rhetoric of self-determination to mask a policy of sophisticated imperialism." President Woodrow Wilson, too, according to this interpretation of the continuity of economic and political interests under the guise of moral pronouncements, defended his policy in precisely similar terms. The purpose of the Monroe doctrine, in the early period, was to acquire contiguous agricultural land; later it was modified to meet "the needs of capitalist markets and raw materials", according to Williams.

This sample of historical cases is presented to stimulate an analysis of basic similarities of gap between the rhetoric and reality of foreign policy and its operation in the past and the future. While

Kennan, in his speech quoted above, advocates the foundation for a new post-cold war foreign policy on a blend of moral and practical grounds and quotes the liberal hero, John Quincy Adams, the secret memorandum that he issued as the head of the State Department's Policy Planning Staff in 1948 shortly after the publication of the article in the *Foreign Affairs*, spells out the 'earthy' needs and interests' aspect of his policy pronouncement

In the memorandum quoted in the article by Noam Chomsky in the *Monthly Review*, Kennan wrote "We have about 50 per cent of the world's wealth, but only 6.3 per cent of its population In this situation we cannot fail to be the object of envy and resentment Our real task in the coming period is to devise a pattern of relationships which will permit us to maintain this position of disparity We need not deceive ourselves that we can afford today the luxury of altruism and world benefaction We should cease to talk about vague and unreal objectives such as human rights, the raising of the living standards and democratisation The day is not far off when we are going to have to deal in straight power concepts The less we are then hampered by idealistic slogans, the better This statement should be seen in the contemporary context of the widening gap between the rich and the poor in the third world countries

Several publications including respectable professional journals have pointed out the increasing income disparity in third world countries Two examples of such analysis from the world system and dependency viewpoint can be cited Two articles published in the *American Sociological Review* the official journal of the American Sociological Association in 1990 linked with supportive data, the global expansion of economic dependency with income inequality and consequent protest movements One article suggested that while the effects of dependency on generating rebellion through economic growth and income inequality are straightforward the effects through repression differ by the character of the regime ('Dependency and Rebellion A Cross-National Analysis' by Terry Bosswell and William J Dixon *ASR* August 1990, p 555)

The other article also, presenting impressive data about protest movements following economic growth with "austerity measures" concludes that while the long-run consequences are unclear, "social unrest provides a motive and an opportunity for certain third world states, especially the new democracies, to reassert an economic nationalism based on reduced dependence" ('Global and National Sources of Political Protest Third World Responses to the Debt Crisis' by John Walton and Charles Ragin, *ASR*, December 1990, p 888)

To sum up, economic inequality accompanies economic growth and there are different forms of repression resulting from economic dependency often linked with military dependency. An important point to add in this kind of analysis is the political instability currently plaguing what was once called the second world and the consequent weakness in projects of organising countervailing forces against the domination of the US power

The policy of containment that George Kennan outlined led to interventions in other countries in three basic forms (a) high visibility-high cost, example Vietnam, (b) high visibility-low cost, example Gulf war, (c) low-intensity-low cost, examples Nicaragua, Chile The cost in all these cases relates to American manpower and financial power

The first type of intervention is likely to be avoided in future The occurrence of the second type will depend on the range of foreign resources, secondary and monetary, available and a convenient concatenation of events which does not afflict American population and economy The third type of intervention will continue in various forms as in the past A fourth type of intervention that is likely to proliferate in future can be described as low visibility-low cost intervention involving 'soft co-optation' of leaders and groups in third world countries

An article published in the *Christian Science Monitor* (August 14, 1990) by Joseph S Nye Jr entitled, 'Soviet Power and America's Soft Power', presented a succinct description of this tactic It will involve the structuring of "the political agenda and the framework of debate in a way that shapes the preferences others express" According to this approach, the ability to affect what other nations want is associated with "intangible power resources such as culture, ideology and institutions" Institutions like the World Bank and GATT are cited as examples of the success of such 'soft power'

The US has two special advantages in this area One is the proliferation of think-tanks and service organisations with the objectives of spreading the message of 'freedom and free enterprise' Many such organisations claim to be non-governmental but maintain close links with the military-industrial complex Reagan administration's clandestine dealings with Iran and Nicaragua, revealed during the Iran-Contra hearings, exposed the undercover activities of one such organisation with the name of the National Endowment for Democracy

Oliver North, the shady figure who won media publicity during the Iran-Contra hearings, was appointed to head the Project Democracy which this organisation runs Funds were given by this organisation openly to foreign book publishers, labour unions and other institutions and often secretly to forces to destabilise regimes critical of the US foreign policy Some of the organisations like the National Endowment for Democracy often openly honour opposition political leaders in other countries The Heritage Foundation, for instance, hosted dinner parties for the Zulu chief Buthulezi and Angola rebel leader Savimbi during their visits to Washington eight years ago

The second advantage is illustrated by the recent visits of the former president Nixon to Russia and the secretary of state Christopher to China These visits show how Washington's foreign policy-makers are following a clever tactic of keeping contacts not only with the people in power but, also, those opposing them. In the past, it was generally done indirectly or covertly, not it is being done openly and often officially This does not mean that covert contacts are obsolete There have been allegations, for instance, of secret CIA contacts with Islamic fundamentalist elements in Egypt Omar Abdul Rahman, accused in the bombing plot of the World Trade Centre in New York, was charged by Egyptian president Mubarak as a secret CIA agent This was denied by the CIA, but his contacts with Saudi Arabia and Afghan rebels are well-established

The tactic of soft co-optation can take many forms American experts may go to a country in case of problems such as labour disputes threatening the disruption of links with the American market to offer expertise on 'conflict management' While contacts are made both with government leaders and key opposition leaders, in some cases there may also be undercover assistance to the people in power in both areas threatened with challenge from grass roots militant opposition An American diplomat who was killed in Georgia last year while riding in a car with the chief bodyguard for Edward Shevarnadze, was later reported to be a CIA agent sent to train Shevarnadze's security force

Political instability and unco-ordinated discursive types of protest plaguing eastern Europe, former Soviet Union and other parts of the world offer the US a wide field for different types of intervention, consisting of old and new forms The objective of the strategy will be to contain dissent and shape the form of the political order so that the basic structural criticisms of the US interests are neutralised These interests were clearly spelled out in the secret memorandum of George Kennan quoted earlier

Japan's Constitutional Debate

S P Seth

As the post-cold war era is catapulting Japan into playing a global role, a national debate is raging in the country on how best to amend or side-step Article 9 of the constitution which forbids it from maintaining armed forces.

THE post-cold war era has suddenly catapulted Japan into a global role. During the long cold war period, Japan was America's junior partner in a bilateral security treaty. Its defence against a global communist threat (mainly from the Soviet Union) was America's responsibility. The US had imposed a 'peace' constitution on Japan following its defeat in the second world war. Which, under Article 9, forbade Japan from making war or maintaining armed forces.

But, with the cold war escalating in the 50s, the US decided to co-opt Japan as part of its global strategy of containing the communist threat. Japan was returned its sovereignty in 1952, but was required to sign a security treaty with the US to become part of the 'free world'. At about the same time, under a new interpretation of the Japanese constitution, the US urged Japan to raise its own armed forces for self-defence. American pressure led to the creation of a 'police reserve', later upgraded to Self Defence Forces (SDF) in 1954.

Such 'creative' interpretation of Article 9 of the Japanese constitution created a dichotomous situation for Japan—of maintaining armed forces when the constitution expressly prohibited this. In the post-cold war period such dichotomy is only too evident. Japan is now a global power in its own right, being the world's second largest economy. Even though it is still America's security partner, the rationale for this alliance is wearing thin. Japan is seeking permanent membership of the Security Council. It is being asked to contribute troops to the UN peace-keeping operations. As the tensions between the US and Japan grow on trade and other matters, pressures within Japan for autonomous defence are bound to increase. But Japan's pacifist constitution will stand in the way of legitimacy for such a role.

A national debate has been raging about how best to amend or side-step Article 9 of the constitution. Article 9 has two paragraphs which read as follows:

> Aspiring sincerely to an international peace based on justice and order, the Japanese people forever renounce war as a sovereign right of the nation and the threat or use of force as a means of settling international disputes.
>
> In order to accomplish the aim of the preceding paragraph, land, sea and air forces, as well as other war potential, will never be maintained. The right of belligerency of the state will not be recognised.

Article 9 is, therefore, very explicit that Japan would not maintain armed forces. The debate in Japan on this, however, betrays tremendous confusion. Okazaki Hisahiko, a former senior diplomat, recognises the need for amending the article. But, at the same time, he feels that even without its amendment, the government need not be hamstrung. It can always take the plea that the "inherent right of individual or collective defence" is recognised even under the UN charter. Or else, the constitution can simply be side-stepped.

In this regard, Okazaki Hisahiko gives his own example. He says, "I worked for 40 years as a civil servant, and though I wouldn't say I ignored the constitution, I must admit that I carried out my duties without much thought to it." He adds, "Really, though, it seems to me that the greatest skill of those conversant in the law is their ability to weave their way through problem areas where the law does not show the way." This is precisely how the Japanese establishment has so far been getting around Article 9—by legal obfuscation or simply by pretending that it did not exist.

But in the post-cold war period, with Japan poised to play an increasingly autonomous global role, this kind of sophistry and obfuscation has its limit. Therefore, Nakanishi Terumasa is adamant that, "...the SDF must be given explicit approval by the constitution" to give it legitimacy. However, this is easier said than done. Because the amendment to the constitution requires two-thirds majority in both houses of the Diet (parliament) and ratification by a majority vote of the people.

This will not be easy as many Japanese abhor military power. Therefore, according to Moroi Ken, a member of the Constitution Study Council set up by *Yomiuri Shimbun* (a Japanese newspaper), "a much more realistic option than of trying to pass an amendment" is to reinterpret Article 9 in the new circumstances. But the language of the article does not lend itself to any interpretation other than pacifism. The constitutional anomaly will thus continue to exist.

Besides, as Nakanishi Terumasa points out, "Once Japan started down that road [of reinterpretation], it would find itself forever redefining what constitutes a dire threat to its interests and reinterpreting Article 9 to meet each change in circumstances". He adds, "This would deal a fatal blow to the notion that Japan is a law-abiding nation, and once respect for the law goes, the other ideals [democracy, human rights, etc] would go with it." Therefore, amending Article 9 is the only viable option.

As is well known, Japan's present constitution was imposed by the US on a defeated nation. It is only natural that the Japanese people, at some stage, should want to modify it to reflect their new status. Japan has two choices in regard to Article 9: (i) to ignore or reinterpret it with a view to overcoming its constraints; or (ii) to amend it under valid constitutional procedures. The first will always suffer from doubtful legality. The second is a painfully long haul as it requires forging a broad-based national consensus. Clearly, the second course has much to commend it as it discourages the temptation for short-cuts. Such shortcuts tend to subvert the entire system. It has happened to Japan before (in the 30s and 40s) and should, therefore, be a salutary lesson.

For the Attention of Authors

The compulsion to limit the size of issues on account of steeply rising newsprint and other costs and a sizeable backlog of material awaiting publication lead us to request that papers submitted for publication be not over 10,000 words, including tables and notes and references.

It is helpful if contributions in word-processed format are accompanied by floppy disc copies, in Wordstar preferably. The latter will be returned after use.

Goan Intellectuals and Goan Identity

An Unresolved Conflict

Pramod Kale

At the centre of the conflict of identity that Goans face today is the 'paradise lost' syndrome. Being Goan and being an Indian are becoming increasingly two different things.

GOA, one of the smallest states in the Indian Union, a former Portuguese enclave, occupies a unique position in the history of European colonial adventure. When Alfonso de Albuquerque conquered Goa (which consisted of an area of 166 square kilometres of estuarine islands, called collectively *Ilhas* in Portuguese) from the Moslem rulers, he in effect established the first European colonial foothold in Asia. With the two small buffer districts—Bardez in the north and Salcette to the south—acquired by 1533, a total area of 785 square kilometres came under direct rule of the Portuguese king. It was here in this region known as *Velhas Conquistas* (Old Conquest) that a distinct Goan identity was shaped through four and a half centuries of European political, social and cultural domination.

During the early years of their colonial rule in Goa, the Portuguese administration and the Roman Catholic church through the Holy Office (Inquisition) established in Goa in 1560 unleashed a reign of intolerance and terror for the new Christians. The injunctions, prohibitions and restrictions covered aspects of daily life such as preparation of food, what clothes to wear as well as the observance and practice of rituals and performances connected with birth, marriage, and death and aspects of culture such as music. The aim was to bring about a generic change in the local population by cutting it off totally and irrevocably from its roots. To a certain extent the colonial policy succeeded and led to what Tristao Bragancsa Cunha, a Goan political leader and intellectual, characterises as 'denationalisation' of Goans.

"In the whole in India, no people is so denationalised as Goans. A complete lack of national consciousness and the most shameful subjection to foreign rulers, either Portuguese or British, render the Goan Christian a stranger in his own land. A servile follower of everything foreign to his country, hybrid in manners and habits, living in disharmony with his natural surroundings, his strange behaviour makes one doubt the purity of his race, which nevertheless in no way differs from that of the neighbouring Indian. He is considered to be of mixed blood on account of the Portuguese names he has adopted and the western manners he affects. He has even been qualified as a Portuguese Mongrel by a Catholic missionary."[1]

The policy of Christianisation or Europeanisation did not succeed in ridding the Christian population of Goa of its Hindu caste system based on birth. It still retains, after 400 years of conversion, its division into brahmin, kshatriya and sudra castes. It created a paradoxical situation where the new Christians retained their caste affiliations and status grouping, while subscribing to the doctrine and practice of their new faith. The two higher status caste groups amongst the Goan Catholics were the bamons and the charados, corresponding to the brahmin and kshatriya castes of the Hindus. Converts from the 'lower' Hindu castes were grouped together as sudirs, corresponding to the sudra cluster of Hindu castes. The untouchable, atisudra castes such as the mahars and the chambhars, retained their Hindu disabilities even after conversion. Converts from the 'tribal' group such as kunabi gavadas more or less retained their identity and remained only nominally Christian.

The Hindu population which resisted conversion was subjected to numerous humiliations such as deprival of their rights and expulsion from core Catholic region. Many Hindus left their ancestral homes and settled in neighbouring areas. The Hindu migration was followed by the migration of a large number of new converts, who fled the excesses of zealous inquisitors who were more powerful than any civil or military authority the Portuguese administration had. The first wave of Goan migration was thus caused by the policy and practices of the Church with its narrow counter-reformation ideology. During the two centuries of its almost total ascendancy, the Church institutionalised its control over the local Christian population. The office of *Pae Dos Cristaos* was created to watch over the privileges and special interest of the native Christians.

The second wave of migration which started in the late 18th and early 19th century was the result of the stagnation of local economy and the decline of Portugal as a colonial power. During the Napoleonic wars the British occupied Goa for strategic reasons and although they withdrew later, it made Goans aware of jobs and opportunities offered for advancement. Goan migration, which has continued for the last two centuries, has not been confined to any one caste group amongst the Catholics. The upper caste emigrants (bamons and charados) have followed careers as colonial administrators, academics, lawyers, doctors, journalists and technocrats. The sudirs go in mainly for 'sirvis' (service).

More than the Portuguese civil and military authorities, it was the Church hierarchy, dominated by European clergy, that wielded real power in Goa. 'Viceroy comes, viceroy goes, but the Paulist Father stays here forever,' says a Goan proverb (*'vice-rei vai, vice-rei vem, O Padre Paulista sempre tem'*).

One can discern several major elements which have contributed to the formation of Goan[2] identity. Firstly and most importantly, it is the Roman Catholic Church which has shaped the Goan identity through the last 400 years, giving the Goans not only their names but a belief system which they shared with their colonial rulers. The continuance of a hierarchical social system based on Hindu castes has been a contradictory, though important force which has overtly and covertly contributed to the formation of this identity. No less important to identity formation are the contributions of the Goan diaspora and the Goan intellectuals of various persuasions and ideologies. These various elements have not always been harmonious with one another and the conflict of identity that Goans face today has its roots in them.

In the 16th, 17th and 18th centuries the intellectual life of the Goans (or the Canarins as the Portuguese called the neo-Christians) was dominated by the foreign clergy. Seminaries like those at Pilar, Rachol and Saligao which trained the clergy for propagation of faith throughout Asia, were centres of traditional religious instruction and operated within the intellectual boundaries set by Rome and counter-reformation. Of the three religious orders in Goa, the most influential was the Jesuit in the district of Salcette. (The

Dominicans, also in charge of the Inquisition, ruled in Ilhas which contained the capital city, Cidad da Goa. The Franciscans were given the northern district of Bardez.) Although brahmin converts were trained for parish priesthood up to 1600, a strict colour bar existed against the admission of native converts as clergy in all religious orders till 1750. It was only after Marquis da Pombal removed the civil and religious inequities to which the Canarins were subjected that a class of non-clerical native intellectual began to emerge (the non-Christian population in Goa had to wait for another 150 years before they could enjoy the same benefits of civil and religious liberties, early in the 20th century.

The early intellectuals amongst the Goans were, predictably and inevitably, influenced by the European models of the day. They were divided in their polemics as Royalists and Republicans, conservative Catholic dogmatists and secular anticlerical reformers and humanists. Europe shaped their thoughts and European concerns were their concerns. Most of them were educated in Europe and spent much of their time there imbuing their minds with new ideas that represented the spirit of the age. They mastered many European languages. They wrote in Portuguese mainly, but also in French, English and Italian. They were civil servants and administrators who served the Portuguese in Goa and other colonies. They were doctors and lawyers. The were scions of the landed gentry (Bhatkar) in Goa. They lived in their palatial houses in Goan villages. They collected honours and titles from the Vatican and from various European courts and republics, they got their biographical sketches and titles entered into publications meant for that purpose. They subscribed to European magazines and journals. They wrote novels and plays in Portuguese and acted them out in Margao and Panjim. Their social life generated a unique syncretic culture marked by performances such as Mando and Dekani. The colonial rulers granted these Eurocentric metropolitan intellectuals the status of 'asimilados'. These asimilados were role models for the upper class Goans.

From the Eurocentric intellectuals arose a class of intellectuals in Salcette area in and around Margao, who began to concern themselves with ideological issues and participatory, elective politics at the local, provincial and colonial levels. Noteworthy amongst these is Bernardo Peres da Silva, a member of the Portuguese parliament from 1822-1844 (representing Margao constituency), a partisan of the liberal party, friend of Prince Regent Don Pedro, who rewarded him with the Prefectship (a stand-in title for governor general) of Goa. The Prefect lasted only for two weeks in January 1835 when he had to flee to Damao because the Europeans in Goa refused to accept his authority. Rogerio de Faria, a wealthy Bombay merchant, lent his active support to organise an expeditionary force to help the deposed Prefect. This diasporic connection failed to achieve anything. The onset of monsoon defeated it.[3] A towering figure amongst the Goan intellectuals of mid-19th century was Francisco Luis Gomes, a parliamentarian, novelist and biographer of Pombal.

Menezes Braganca's life and politics later in the century provided a bridge between the Eurocentric intellectuals of the 19th century and a new breed of intellectuals for whom Goan autonomy became a goal—a possibility. His anti-clericalism and anti-colonialism soon marked him out as a pioneer of 'Goan nationalism'. His younger kinsman Tristao Braganesa Cunha can be called the first 'Indian nationalist', a Goan intellectual who looked upon Goa's political struggle and destiny as a part and parcel of the Indian national struggle for freedom.

Broadly speaking, the historical movement amongst Goan intellectuals appears to follow the path which Gramsci has charted in his discussion of the typology of traditional and organic intellectuals.[4] The traditional Goan intellectuals come mostly from the elite class and the two upper castes, bamon (brahmin) and charado (kshatriya). The upper castes distinguish themselves from the sudirs (sudras), a blanket term used to describe converts from all other castes which include a number of occupational groups of varying social status. Although no census figures are available from pre- and post-independence sources, it is evident that the sudir caste is numerically largest amongst Goans. Historically members of sudir group worked as tenant farmers (mundkars). They also worked as menials and servants in landlords' houses and places of business and as small independent tradesmen: carpenters, tailors, barbers and cobblers. They received their rudimentary education in

the three Rs and in music at the parochial schools run by the clergy in the village. For them the clergy and the teachings of the Church were of much more importance than for the upper castes. The first wave of Goan migration to British India was from this group. The early Goan emigrants to Bombay, for instance, worked as cooks, butlers and domestic servants for the British. With their familiarity with western music and instruments they found employment as players and bandmasters. A large number worked as shiphands, sailors, cooks and stewards on passenger and cargo lines. These 'shippies' (tarwatis) earned good wages, saved substantial sums with which they were able to buy land and build houses. A sizeable part of this money was also spent in ostentatious living, prompted by a desire to compete with the landlords of the bamon and charado communities. At present this tradition is continued by Goans who earn their living in the Gulf countries and many of whom come from the same background. The 'Gulf Goans' are a very vocal and powerful group in shaping the identity of Goans today.

The sudir community shows some characteristics of the subaltern group. The intellectuals amongst this subaltern population seem to have a different worldview and different sense of identity than the elite intellectuals have. Their literature, their theatre as well as their politics reflect a distinct worldview which seems to be a convergence of three elements. At the very bottom is the traditional (Indian) belief in a strict hierarchical ordering within the family and the society which is based on prescriptive rather than ascriptive norms of relationship between its members. The second one is provided by religion, a belief in the sanctity of the Church and the clergy, of suffering and martyrdom, of humility and poverty, in divine intervention and miracles wrought through prayers, rituals and penance. The third is acceptance of the western way of life a nostalgia for the symbols of European colonial rule. This worldview is reflected in popular Konkani Tiatrs and in Romanses (romantic novels) in Konkani. It is also expressed in the 19th century and contemporary Goan journalism in Konkani, English and Portuguese published from Goa and outside Goa. The migrant subaltern Goan from Bombay, Karachi, Nairobi, Lisbon, London, New York or Toronto has contributed as much to the shaping of a common ideology and dream of Goa as the Goans living in Goa.

During the last 30 years, since the Indian troops marched into Goa to make it a part of the Union of India, the Roman Catholic society in Goa has undergone radical changes. Vatican II has brought about changes in the Church which reflect, to a certain degree, in the more liberal attitude toward the formal aspects of religion evinced by the upper caste Catholics—the BC's as they are called in Goa. Culturally many have traced and reaffirmed their pre-conversion roots in the use of names and surnames. Historically, Goans have been migrating out of their region but very few outsiders, if any, have migrated into the state after the inclusion of *Novas Conquistas* in the 18th century. During the last 30 years the Goans have faced migration into Goa from other parts of India. These are job-seekers, entrepreneurs and labourers from the neighbouring states in India. Numerically, the migration has not been great, but it has certainly affected the 'quality of life', as Goans remember it from the unhurried days of Portuguese rulers. From the isolation and stagnation of a colonial dependency, the Goans find themselves thrust into a world of fierce economic competition. In this world the Goan emigrant worker in the Gulf, and the traditional landed gentry feel equally threatened by the outsider. This has forced them to make political alliances. During the last five years these alliances have achieved some positive results. Konkani has been recognised as the official language. Goa has been granted statehood after being a union territory for a long time. The alliances have also been instrumental in winning power and pre-eminence for Roman Catholic political leaders. There have been three Roman Catholic chief ministers during the last three years in Goa, a privilege they did not have for three decades after Goa's integration into Indian polity.

These political gains are not unmixed blessings for the Roman Catholic community in Goa. Under the colonial dispensation of the Portuguese, the Roman Catholics and the Hindus lived peacefully with each other. There were no communal riots in Goa. The two communities existed in separate spheres—not so much in harmony with each other, as in ignorance of and indifference to each other. This was the paradise of peace and tolerance (*Bhuvaicunta*) that Goa was, as imagined by the Goans. It is this 'paradise lost' syndrome which is at the centre of the conflict of identity that Goans face today. Being Goan and being an Indian are becoming increasingly two different things. This crisis directly affects the praxis of politics and culture in this very small state. As a state, Goa draws a large share of its income from tourist trade. The Goans have a love-hate relationship with the tourists, especially what are called, not so lovingly, the 'Indian' tourists who are regarded as uncouth, cheap and messy. Goans also dislike the young European-backpacking sun-worshipper as tourist. At the same time Goans do not want five star tourism and have organised themselves to fight it as the Army of Awakened Goans (Jagrit Goykaranchi Fauz). The most recent example of Goan resentment is the opposition to the Konkan railway, a coastal railroad network, passing through Goa linking it with coastal areas of Maharashtra, Karnataka and Kerala. The intellectual leadership for organising this protest comes from a group of Goans who are concerned more with ecology than with the unique historical experience of Goa.[5] They come mostly from the upper crust of Goan society. Although they have formed a loose coalition with the subaltern sections of the community, in practical terms they do not share common interests especially where economic development of Goa is concerned. The kind of ecological restraints advocated by the environmentalists would probably not sit too well with the kind of development which the formerly subaltern groups, such as the 'Gulf Goans', flush with their money want in Goa. This might provide another dimension to the conflict of identity generated by enlightened self-interest amongst the various groups of Goans.

Notes

1 Goa Congress Committee, *Denationalisation of Goans*. Bombay, 1944 Although anonymously published, the pamphlet is definitively attributed to Cunha in Antonio da Cruz, *Goa Men and Matters*, Vasco da Gama, Goa, 1964, p 14

2 The term Goan has been used to describe the Roman Catholic population of Goan origin (for the most part descendants of the Hindu converts from the Velhas Conquistas—Conquest districts of Tisswadi, Bardez and Salcette in the 16th century) Historically they have been designated as Canarins, Luso-Indians or Assimilado The Hindu population of Goa was in various historical epochs, described as Gentoos, Hindus or Indigenas Currently in the state of Goa the Roman Catholic population is less than 48 per cent For the purpose of this paper the term Goan excludes the non-Roman Catholic population of Goa

Explanation and Prescription

Sumanta Banerjee

Five Lectures in Marxist Mode by Randhir Singh; Ajanta Publications, Delhi, 1993; pp 131, Rs 65.

IN an age, where non-committal ambivalence has become the sign of etiquette in debates in the academic *beau monde*, it is refreshing to find someone like Randhir Singh making his position clear at the outset without the post-modernist obligatory humming and hawing. What he said at a conference of the Andhra Pradesh Civil Liberties Committee in April 1991 (which is included in the present collection) is worth quoting, since it is the spirit behind that which inspires all the writings which make up this slim volume. While introducing the topic on which he was requested to address the conference ('Terrorism, State Terrorism and Democratic Rights'), he said: "Mine will be in fact a straightforward political and partisan exercise in the sense that in a class divided, exploitative society like ours all worthwhile thinking is, inevitably as it were, political and partisan. In such a society, on all important issues, in philosophy as in real life, neutrality is an illusion. Here everything said or done, or left unsaid or undone, helps one side or the other".

The present collection of seven of his writings (including three excerpts) is an excellent example of Randhir Singh's forte—a combination of impassioned involvement with, and a simultaneous rigorous analysis of, the issues about which he writes. Although encompassing different topics—separated by both time and space (e g, crisis of socialism in the Soviet Union, communalism and casteism in India, democratic rights in Punjab and Kashmir, the Ghadar revolutionaries of 1914-15)—there are some common recurring threads that bind them together and make this collection an important companion for both academics and activists who are either interested, or involved in, the movement for a socialist transformation of Indian economy and society.

All through the collection, the reader will discern (i) a stress on the necessity of linking theory and practice—a harking back to the old Marxist concept; (ii) urging upon practitioners to return to the old communist norms of personal conduct and moral elan; (iii) a reassertion of class-based ideology as distinct from caste or ethnic loyalties—traditions which are being harnessed by small-time political operators and legitimised by new-fangled theories by certain academics; (iv) a demystification of the ruling class concept of nationalism and replacing it with socialist concerns; and (v) an attempt to restore the terms of discourse (which have been derailed and appropriated by the state and the ruling classes) to the original tracks of the basic economic and political problems.

One of the abiding concerns that permeates the writings is the need to restore the moral elan of the revolutionary moments of the early communist movements and the revolutionary nationalist movements in India. Writing about the betrayal of the democratic norms that were enshrined in the objectives of the international communist movement, Randhir Singh refers to the building of the hated Berlin Wall by the communist regime of East Germany, quotes Bertolt Brecht's prescient lines from a poem of his (composed during the communist suppression of a workers' uprising in Berlin in 1953), and then makes an observation about the then communist rulers of East Berlin which, strangely enough, I find equally applicable to the present Leftist rulers of West Bengal: "Whatever the motivations or extenuating circumstances, this stubborn refusal to see or hear or speak, when it was their revolutionary duty to see, hear and speak, constitutes an act of historic complicity on the part of these leaders and functionaries that is crying out for atonement, which must visibly express itself, above all, in a return to communist norms of personal conduct and a better, revolutionary practice of Marxism" ('Crisis of Socialism'). Are the younger cadres of the CPI and the CPI(M) willing to listen to this voice of a senior comrade of theirs? The article from which I quoted the above is both emotionally nostalgic and theoretically challenging, a combination which always marks Randhir Singh's best speeches and writings, like his talk at Jalandhar in September 1992, 'In Memory of Punjab Revolutionaries of 1914-15', where he recalled the three vital aspects of the Ghadar movement, which were to be inherited by the later day Indian communists, but which "got lost somewhere along the way"—a clear strategic aim, an independent, alternative politics and the moral elan.

Way back in 1974, writing about the crisis in the Indian economy and its impact on the middle classes at that time, Randhir Singh observed: "This also produces a type of opposition to the government that is not based on the study of society or a grasp of the failure of the capitalist system in India. Moved only by economic hardship, such opposition can... easily play into the hands of the extreme right-wing, fascist or semi-fascist opposition" ('Concerning Indian Economy'). Sixteen years later, the author comes to grips with manifestations of such opposition—the agitations over the issue of job reservation for OBCs and the communal outbursts of the Hindu fanatic organisations—in two interesting speeches (included in this volume under the titles 'Of Reservations' and 'Communalism in Contemporary India'). In both, he reasserts the need for the Left to establish and function on the terrain of independent class-based people's politics, in order to counter the various groups of the elite which are tapping the divisive potential of communalism and casteism. On the rise of Hindu communalism in particular, he reminds us that Gandhi and the bourgeois-led Indian nationalism, along with its other limitations, carried a great deal of Hindu communal baggage, and he therefore warns against simplistic, though well-meaning attempts to fight communalism with nationalism: "...a struggle against communalism from the standpoint of nationalism is, if not entirely misleading, highly inadequate and problematic".

The other dangerous dimension of this type of nationalism-versus-the-rest discourse is the public socialising into accepting growing intrusion of the state apparatus into our social existence. In his inaugural address at the Andhra Pradesh Civil Liberties Committee conference in 1991 ('Terrorism, State Terrorism and Democratic Rights'), Randhir Singh described how in the context of 'terrorist violence', such intrusion and violation of human rights by the state were accepted (both by the public and the academic circles) as necessary in 'national interest'. In such a metaphysical mode of thought, "all distinctions are blurred or obliterated, and everything, all such protests, resistance or struggles are simply lumped together into one omnibus thing called 'terrorism'." While fighting this mode of thinking, Randhir Singh again stresses the need for analysing state violence in terms that should go beyond merely the 'human rights' dimension, and for viewing it as a manifestation of "class violence, as an expression of class domination or policies, as a part of the ongoing open or hidden class struggle in society".

Randhir Singh touches upon issues which divide Indian Marxists, and challenges them to formulate a common theoretical approach to problems like the rise of caste-based movements, the offensive by communal organisations, the concept of 'nationalism' and 'national interests' as propounded by the Indian state—problems which demand bold ideological interpretations and innovative solutions. As is obvious, it is a vast and complex gamut, encompassing fundamental and contentious issues like the place of religion in Indian society (and the Marxist attitude to it), the role of the different castes in our rural society and their changing attitudes, the perception of India as a nation (whether it is shared in common with the majority communities by the various religious, ethnic, regional minority communi-

ties) While I agree with his basic thrust on restoring the class-based politics of the communist movement (which has been ousted from the mainstream in the Hindi Hindu belt—obsessed as it is with casteist and communal concerns —and has been derailed and distorted in the original Left strong holds, thanks to parliamentary power politics), I feel that the traditional Marxist concept of polarisation of the people along class lines (in the context of 19th century West European politics, between the capitalist class on the one hand and the industrial proletariat on the other) does not cut much ice with the poor classes here who appear to be more motivated by their caste loyalties than class interests —even among those Bihar poor peasant villagers who under the influence of the various naxalite groups seem to be willing to kill members of their own class just because they belong to the upper castes, to the extent of even killing their children! It is an uphill task to introduce class based politics to replace caste based hostilities among these people

This brings me back to a deeper fundamental question— which Randhir Singh touches upon when he writes about the crisis of socialism why after 70 years of a socialist system that apparently assured economic equality to all the different ethnic, religious and linguistic communities members of all these communities today are breaking away and engaging in the worst forms of communal conflicts Obviously, it was not merely because of Lenin's "unworthy successors" (as Randhir Singh suggests in one of his speeches) that the socialist system collapsed, but due to more deep-rooted and built-in tendencies in the very strategy of building socialism in the Soviet Union (that was shaped by Lenin himself) and later in the East European countries

Readers can differ with Randhir Singh on his analysis and suggestions, but can certainly share the belief that inspires him ' in all human activity, whose characteristic is purpose, knowing and doing are so related that explanation is invariably suggestive of prescription, just as a diagnosis always points to the treatment' It is this that should prompt his readers to join him in exploring the complex Indian socio political scenario and seeking a solution

A Tale of Two Countries

China and India

Ashima Goyal

Uneven Development in the Third World: A Study of China and India by A S Bhalla, Macmillan, London, 1992, xix + 353

I

APART from its intrinsic merits, this volume will be widely read because of its topicality At a time when some liberalisation and export led growth are coinciding in China and India tries to embark on the same route, many are looking to learn from the Chinese experience Bhalla has provided a timely and in depth analysis of many dimensions of a possible comparison Precisely because of this the study unwittingly highlights just how careful one has to be in making such comparisons

Following Hirschman's seminal contribution the author uses the idea of uneven development as a cutting edge to organise his work He focuses on the role of inter and intra sectoral balance and general aspects of equality as possible strategies of development He then searches for imbalance in the outcomes of the development process whether it occurs in growth, consumption or income across different sectors and groups or in the access to technology health and education India and China are systematically compared in all these aspects

Part I of the book surveys concepts of uneven development and applies them to the examination of the Indian and Chinese case These relate largely to inter-sectoral linkages and investment shares Part II presents a detailed factual presentation of the outcomes of development according to the sub-headings outlined above The period covered spans the 50s through to the 80s The first chapter of the book motivates the study by listing the similarities and contrasts between the two countries The last concludes by analysing factors of the political economy in each country, and largely holds them responsible for flaws in strategies and outcomes

The search for balance empirically takes the form of linkages between different sectors and their shares in investment and other services The political economy similarly is analysed in terms of the conflicts between different sectors and groups One aspect of Hirschman's advocacy of imbalance was that as pressures built up, there would be strong incentives through the market, that would induce development This aspect is not highlighted, which is a lacunae, given the current emphasis on market-led growth There are insights on this, scattered here and there, but one has to search for them Correspondingly, in the last chapter, the concerns of current theories which endogenise institutions such as property rights, strategise group dynamics and seek to discover an optimal mix of government and market activities are neglected

Apart from the obvious resemblances between the two countries the divergences in institutions, such as property rights and the nature of governance, make a comparison illuminating, and perhaps illustrate why their experiences have been so distinctive They started off with analogous levels of development in the 40s, and followed the same sequence of strategies that led from a reliance on heavy industry, to agriculture-led and finally export-led growth with greater reliance on the market The author blames flaws in the design of strategies and in their implementation for shortfalls in both countries Even so, China has always overtaken India both in rates of growth and in switch points between strategies What is the reason for China's consistently better performance? Let us search for answers Another aspect on which the book can throw light because of its focus, and because of China's lead in growth rates and policy switches, is the changing nature of the interaction between agriculture and industry in different stages of development

In order to fulfil this objective we first gather some stylised facts from the book The very useful collection of data makes it possible

II

Per worker productivity grew much faster in China as compared to India The quantum leap in growth in the former, occurred in the 60s for industry and the 70s for agriculture However, in both countries, the increase in total factor productivity was small, and much of the growth came from a rise in inputs As an example, chemical fertiliser use in China in the 80s was three times and the power irrigated area two times that of India The high yielding varieties of seeds in use for grain production in China lead those used in India by a generation There is evidence that credit is more freely available for the rural sector in China relative to India Price subsidies on non-farm inputs have been as high as 30 to 40 per cent The incremental capital-output ratios are lower in China The share of investment in Indian agriculture is more than double that in China The composition of agricultural investments differs in India In the latter, the large hydroelectric or irrigation projects have very low capacity utilisation and poor water management systems

In making these contrasts, it must be remembered that there are wide variations in concepts and coverage of data between the two countries For example, investments in collective farms and in labour were not included as part of agricultural investment in China Capital goods were underpriced in China and overpriced in India

In both countries, productivity is much higher in industry than it is in agriculture Although the gap is decreasing in China since 1971, it is widening in India The share of industry in Gross Domestic Product in China was 50 per cent in 1987, more than double that of India While this partly reflects higher growth in the former, it is also due to the low share of the tertiary or service sector in a communist regime Such sectors

were regarded as unproductive. With the widening role of the market, this sector is growing rapidly now. Some of the rapidity of current Chinese growth can perhaps be explained by a long suppressed proliferation of service establishments!

There has been a widespread development of rural industry in China. Rural nonfarm enterprises enter into joint ventures with urban industry for the processing and marketing of farm products. Like Indian, Chinese agriculture is largely subsistence, so that output linkages with other sectors are low. This means that an increase in agricultural output does not cause a large stimulus of production in other sectors. Bhalla suggests that another reason for this could be that, in China, before the liberalisation in 1979, the agricultural price policy was such that procurement prices were deliberately kept lower than market prices. Producer incomes were therefore low and translated into low demand for input supplying industries in the manufacturing sector. At the same time forward employment linkages were high, due to additional employment generated in the storage, processing, transportation and distribution of agricultural output, and this has grown particularly after 1979. In India the structure of employment linkages, while high for select sectors, was different. Varying labour market institutions probably provide a large part of the explanation for this.

III

What are the insights from the book on the ways in which institutions differ across the two countries and their effects on the respective growth processes? Firstly, labour markets are very different. In China, there are restrictions on the free movement of labour. This may form part of the explanation for (i) the large gap between productivity of labour in industry as compared to agriculture, and (ii) the much more widespread development of rural industry. Wage differentials have been low, although they are increasing now. Income and consumption inequalities are much lower than in India but not regional inequalities. The initial land reforms, public distribution of food and rationing, and narrow wage differentials ensure greater equality.

As regards health China has provided better access than India, although with the current greater dependence on the market, facilities are improving for those at the upper end of the income spectrum, and worsening for those at the lower end.

In the post-Mao period the New Education Policy has accorded the highest priority to the expansion and improvement of higher education. It is recognised that the programme of the four modernisations requires an adequate supply of highly qualified manpower. Some degree of elitism is creeping in. This contrasts with the current emphasis on primary education in India.

The nature of Chinese government and the cultural ethos seems to have allowed a large degree of regimentation of the individual. Yet there was a decentralisation of decision-making and intense competitiveness across regions, particularly in the post-Mao period. It would seem that the initial revolutionary fervour, combined with party discipline and redistribution of assets allowed labour and savings to be extracted from the individual, without adequate compensation in terms of increasing consumption. The low growth in total factor productivity indicates that much of early Chinese growth came from accumulation of inputs. The current stress is on augmenting labour productivity both through a raising of pecuniary incentives and of skills.

Although Chinese policies have been much more successful than Indian, there have been shortfalls and imbalances compared to expectations. Even so, policy-makers have shown a flexibility, an ability to extract the maximum from one mode and then rapidly switch to the other. In India the current fashion is to bewail the mistakes of the past, in China it seems to be recognised that the success of one strategy of development depends on skills built up during the earlier one. The present market-friendly mode, while it has yielded very rapid growth, is throwing up some problems. One such problem is a decline in investment in agriculture. In the Mao period, the agricultural price controls were partly blamed for the poor performance of agriculture, but rising agricultural incomes in the 80s have not lead to rising investment in agriculture. Instead there has been a large increase in expenditure on consumer durables and of investment in non-farm activities. Public investment in agriculture has also declined, leading to serious expected infrastructural constraints on the expansion of agricultural output. Over 1980-85, while the planned investment in Chinese agriculture was set at 11-14 per cent, the actual turned out to be only 3-4 per cent.

India's more democratic structure gives people more freedom to make their own choices (or is it mistake?). Sadly, any possible gains in information, due to freer individual decision-making, have been frittered away by arbitrary market controls and bureaucratic ossification. It was as if in the absence of redistribution of assets, equality was sought to be imposed by taking more and more for the government. Unfortunately, this was not used as efficiently as it could have been. On the positive side, as Sen has argued, democratic institutions and the pressure they can put on public policy have perhaps meant that India has been more successful than China in preventing famines, although it has not been able to prevent endemic malnutrition among the poor.

IV

Theoretical macromodels in the structuralist framework [Bose 1989; Rakshit 1989] have shown that when demand for industrial goods from agriculture is high, then an increase in real wages can lead to a rise in growth of industrial output. Otherwise, as wages rise and agricultural prices follow, demand for industrial products falls. Industrial profits are squeezed from the cost and revenue side. Murphy et al (1989) demonstrate that it is when agricultural per capita incomes are high and evenly distributed, that demand for industrial goods from agricultural incomes is high. Growth in the latter can then fuel industrial growth. Perhaps fortuitously, the combination of policies in China allowed them to achieve this kind of growth. Communism led to even distribution of income. Policies, including restrictions on labour movement, encouraged a decentralised development of rural industry, so that employment and wages could rise. Bhalla reports that the number of TV sets possessed per 100 rural households rose from 0.1 in 1978 to 6.6 in 1988. With the move to greater market incentives and shift to consumption demand, the fall in investment in agriculture could lead to supply shortfalls and inflation.

What can our policy-makers learn from this comparison? In particular, the necessity of stimulating investment and ensuring its correct allocation. Market forces have been insufficient to ensure adequate investment allocation to agriculture in China. The importance of policies that encourage rising productivity through competition, learning and technology spillovers. A deemphasis on technical education is obviously inconsistent with this. In the new information age, there is a real possibility of generating high productivity employment in agriculture, and in decentralised industry, taking advantage of economies of scope. Both countries may see a shift from subsistence agriculture to one more oriented to the market. In general, the virtues of flexibility. The lesson that policies that operate on endowments are a more efficient way of ensuring equality than detailed intervention in market processes. The proviso should be kept in mind, that insofar as initial conditions and history are important, and institutions take a long time to adapt, there are limits to what policy-makers can do.

One book has taken us far. What more can we ask? Some discussion of macro balance and foreign inflows would have been useful as China reels from inflation and a deluge of foreign inflows and India courts both.

Macro-Economic Policy in Times of 'Globalisation'

Prabhat Patnaik

Why, under certain circumstances, does a government find itself incapable of pursuing expansionary economic policies even in situations characterised by industrial stagnation and accumulating foreign exchange reserves? This is an important theoretical issue suggested not only by the current Indian context but also other historical contexts, e g, Thatcherite Britain.

This paper is addressed to this issue. The author's basic argument is that this represents another facet of 'globalisation'. In an economy which has no control over capital flows and where the policy regime favours a retreat of the state from the arena of production, such a combination of stagnation, reserve accumulation and government impotence can easily arise

Critics of 'market-friendly' regimes in the context of third world economies have typically emphasised the possibility of capital outflows and dwindling reserves as constituting, almost exclusively, the inherent danger of such regimes But this is a partial view. Such an economy is threatened as much by accumulating reserves as by dwindling reserves If the adverse consequences of the latter are more dramatic, those of the former are by no means less significant

I

HE experience of the Indian economy in ie recent months has been quite bizarre: oreign exchange reserves have kept piling p, with the government apparently not nowing what to do with them, even as conomic growth continues to atrophy It nay of course be the case that these reserves, large as they are relative to the level wo-and-a-half years ago, are still not as omfortable as should be; it may be the case iat with large debt-service payments fallig due in the coming months these reserves 'ould vanish in no time; it may even be the ase that they would vanish anyway, built up s they are on the basis, to a significant xtent, of hot-money flows. But these are all pecific, *empirical* issues which I shall not e discussing in the present paper. My conern is somewhat different. The current uild-up of reserves is not a deliberate policy ecision, and nobody from the government as claimed that it is. This raises the queson: why, under certain circumstances, does government find itself incapable of pursug expansionary economic policies even in tuations characterised by industrial stagation and accumulating foreign exchange serves? This is an important theoretical sue suggested not only by the current idian context but also other historical conxts, e g, Thatcherite Britain, and the present iper is addressed to this issue.

My basic argument is that this represents nother facet of 'globalisation', i e, in an onomy which has no controls over capital ows (or which is in the process of lifting ich controls) and where the policy-regime vours a retreat of the state from the arena production, such a combination of stagition, reserve accumulation and governent-impotence can easily arise. Typically, itics of 'market-friendly' regimes in the context of third world economies have tended to emphasise the possibility of capital outflows and dwindling reserves as constituting, almost exclusively, the inherent danger of such regimes.[1] But this is a partial view Such an economy is threatened as much from dwindling reserves as from accumulating reserves. If the adverse consequences of the former are more dramatic, those of the latter are by no means less significant

II

In Sections IV and V of the present paper I present a simple model to clarify my argument that a 'market friendly' regime can well be characterised by a combination of economic atrophy and accumulation of reserves. The essence of the argument however is briefly summarised in this and the following sections. Once controls over capital-flows are lifted and the economy seeks to attract capital from abroad, the interest rate which foreign depositors can get has to be pitched at a level which is sufficiently favourable compared to what rules abroad. Since the structure of borrowing and lending rates of banks has to have some internal consistency (and interest rate discrimination is increasingly abandoned, together with domestic finance rationing, as the economy gets more 'liberalised'), this more or less fixes the entire structure of interest rates, so that we can, without any loss of generality, talk of *the* interest rate being fixed by international considerations.[2] Now, suppose at this interest rate, the inflow of foreign funds increases at a faster rate than the net foreign exchange requirement on the capital account for the given exchange rate, then foreign exchange reserves would pile up.

In the face of this pile-up of foreign exchange reserves, the government can do any one (or a combination) of the following things. First, it can, for the given exchange rate, lower the interest rate But if it did so, since the foreign exchange inflow cannot be fine tuned, it runs the risk of putting off foreign investors altogether setting up expectations of a deteriorating balance of payments, and precipitating an actual payments crisis. It would on the whole prefer not to rock the boat, and continue, aside from marginal changes, with the interest rate that seems to 'work' as far as attracting foreign exchange inflows is concerned.

Secondly, it may try to keep the reserve pile up under control without altering the interest rate. But this would have the effect of pushing up the exchange rate which would precipitate domestic deindustrialisation and affect adversely the export performance. And it would not even stem the inflow of foreign exchange; on the contrary, by setting up expectations of further upward movements in the exchange rate, it may even enlarge the magnitude of foreign exchange inflow. In other words, the policy of desisting from reserve accumulation when foreign exchange inflow is large amounts to letting the current account of the balance of payments adjust to the capital account through upward movements in the exchange rate. Foreign exchange inflows on capital account are accommodated not by piling up reserves which amounts implicitly to capital exports but by enlarging the current account deficit through lower exports and larger imports (at the expense of domestic producers), both of which are brought about by a rise in the exchange rate. This is exactly what happened in Britain: capital inflows stimulated by North Sea gas boosted the value of the pound to the point where large segments of British industry became uncompetitive, resulting in the much-talked about 'deindustrialisation' of the British economy

But this cannot be either a sensible or a feasible policy in an economy such as ours,

whose becoming a rentier as opposed to a manufacturing nation would make little sense.

The third alternative before the government is to expand domestic demand at the prevailing exchange and interest rates. This also has the effect of enlarging the current account deficit to absorb the foreign exchange inflows on the capital account, but does so not by domestic deindustrialisation but by increasing domestic activity. Such an increase however is not easy to bring about for a government that is committed to retreating from the sphere of production. Typically, the instrument which the government can use for increasing the level of domestic activity is a larger fiscal deficit. And the obvious, direct and sensible way of enlarging the fiscal deficit is to step up public investment in areas of high social priority. But a 'market-friendly' regime which swears by privatisation is unlikely to do this. If it does enlarge the fiscal deficit at all, then it does so through tax-concessions (usually to the rich, so that foreign 'confidence' in the economy is retained) or through stepping up unproductive (usually defence-related) expenditures, or a combination of the two.

This way of dealing with accumulating reserves is of course socially undesirable. Tax concessions scarcely result in larger private investment in productive assets (as the US experience under Reagan, not to mention our own experience of the recent past, abundantly shows[3]); they only succeed in stimulating luxury consumption which amounts to frittering away reserves in a manner which not only has low social priority, but threatens the social stability of the regime.

What is more, even this way of keeping reserves under check is not always open to a third world government, for two reasons: first, since the 'market friendly' regimes are under thraldom to the IMF, the latter's disapproval of large fiscal deficits limits the scope for government action. And secondly, in a largely agricultural economy, since agricultural output can fluctuate a good deal, the liquidity overhang provided by a large fiscal deficit that is not used for augmenting productive capacity, especially in agriculture, would sooner or later come crashing down upon the economy in the form of an inflationary upsurge. Even this avenue for frittering away reserves in other words cannot be pursued with impunity.

Finally, the government can choose to do nothing about the accumulating reserves. Even this however is a course of action that is fraught with danger. There is, to start with, the obvious point that the interest rate earned on average on the reserves held is much lower than the interest rate paid out to foreign creditors on the basis of whose portfolio-choice the reserves have been built up. The economy's portfolio in other words is not only inoptimal, but must impinge adversely on its balance of payments in the long run. There is however an additional factor to which I now turn.

III

As reserves accumulate at the given interest rate, the lending capacity of the banking system increases, and does so, *ex hypothesi*, faster than the ex ante demand for credit arising for purposes of commodity production and exchange, which depends essentially on the growth of real income (that is assumed to be slower than the growth of reserves) and of commodity prices (that have not figured in our discussions until now and that can be assumed to be growing at some independently-determined rate, which, for simplicity, and most unrealistically, I take to be zero). As a result the unutilised lending capacity of the banks would *ceteris paribus* start rising. Banks, which, again in a 'market-friendly' regime, would be keen on profits, would not just stand by and idly watch an increase in their excess reserves. They would directly or indirectly create a larger demand for credit by acting in a manner which raises prices, if not of commodities then at any rate of securities. In other words, accumulating foreign exchange reserves would be accompanied by a boom in financial assets, typically a stock-market boom.

Now, in conventional, including Keynesian, economics, a boom in security prices has the effect of stimulating investment through lower interest rates. But where the interest rate itself is fixed for reasons we discussed earlier, a boom in security prices can at all occur if the expected rate of return on securities (i e, the effective 'own' interest rate on securities plus the expected rate of their price appreciation) exceeds this interest rate. In other words, a securities boom is necessarily associated with a rate of return, which taking into account the expected price appreciation, is higher than the interest rate. If entrepreneurs, at the margin, compare this rate of return with the prospective yield on productive investment, i.e, if they reach an 'interior' equilibrium, then the rise in this rate of return would affect productive investment adversely. On the other hand, if investment decisions depend upon the growth of demand and are insensitive to the rate of return on alternative assets, i e, if entrepreneurs reach a 'corner' equilibrium (as we have assumed in our assertion that tax-concessions do not stimulate investment, and as is likely to be true for the oligopoly sector), then investment would remain unaffected.

But no matter what happens to investment to start with, the rise in the rate of return on securities would stimulate further inflows of foreign exchange on the capital account of the balance of payments. As a result the accumulation of reserves would further accentuate giving rise to a cumulative movement. And, what is more, once such a cumulative movement has got under way and the excess reserves of banks have dwindled owing to the increased demand for credit for meeting financial transactions, the cost of bank credit itself would increase. Once this happens, productive investment by the small entrepreneurs, who, in contrast to the oligopoly sector, do take into account the cost of credit in their investment decisions, would be adversely affected, further compounding the problem. In other words, a combination of speculative boom in securities' prices, economic atrophy, and accumulating foreign exchange reserves, would not only characterise the economy but would be come more and more pronounced over time. This cumulative process would go on until there is a collapse either in foreign confidence in the economy owing to rising debt relative to GDP, or in the stock-market bubble. In short, in a situation of this sort, 'doing nothing' cannot be a sensible policy on the part of the government either.

This last argument, about what happens to the economy if the government merely fixes the interest rate, the exchange rate, and the ratio of the fiscal deficit to the GDP, and passively goes on accepting foreign exchange reserves, is illustrated by the following model.[4]

IV

I shall continue to assume throughout my argument that both domestic as well as foreign prices and money wages are given and unchanging. This of course is highly unrealistic but inflation is not my current concern and I make the assumption for simplicity, the argument can be easily recast to take account of rising money-wages and prices both at home and abroad. Now, if we denote the net inflow on capital account (we ignore for convenience all foreign 'aid' and other forms of non market inflows) by F and the rate of return earned by this inflow in the domestic economy by r, and use subscripts to denote the time period and the superscript e for 'expected', then a simple postulate for the behaviour of this inflow is:

$$F_t / F_{t-1} = 1 + a + b.(r^e_t - r^*) \quad .. \quad \text{(i)}$$

where a is some autonomous rate and r^* represents the 'alternative' rate of return (e g, that prevailing abroad).

Now the expected rate of return in the domestic economy is assumed to be the higher of the two rates, namely, the interest rate which is policy-determined, and the expected rate of return on 'securities', which are the only other financial asset (and have, let us say, a perpetual life). In other words,

$$r^e_t = \max\,(i, j^e_t) \qquad \text{... (ii)}$$

where i denotes the administered interest rate (we do not draw any distinction between the borrowing and the lending rates of banks and ignore all considerations of risk) and j^e_t the expected rate of return on securities. This latter consists of two parts: if k denotes the annual flow income assured by the holding of a unit of security and P_{t-1} its price at the end of the previous period (i e, at the beginning of the current period) then the own rate of interest is simply k divided by this price In addition however there is the expected rate of price appreciation. We therefore have

$$j^e_t = k / P_{t-1} + P^e_t / P_{t-1} - 1 \qquad \text{... (iii)}$$

For the expected security price at the end of the current period I shall assume that it is based on an extrapolation of the previous period's price-increase, subject however to two provisos. First, as long as it is generally believed in the economy that over time (i e, for any two consecutive periods) the rate of return on securities cannot be lower than the interest rate, the expected price of securities must have a 'floor' P^* given by

$$P^* = k / i \qquad \text{... (iv)}$$

And secondly, there would be certain independent factors, which are in the nature of erratic influences, which enter additionally into the picture. Taking both these provisos into account, and denoting the erratic element by ϵ, we have:

$$P^e_t = \max\,(P_{t-1} \; P_{t-1}/P_{t-2} + \epsilon ; P^* + \epsilon ; P^*) \qquad \text{.. (v)}$$

In other words, at the 'floor' price, erratic factors can only raise the expected price, but cannot lower it. As for the actual P_t, I postulate the following: the higher the expected rate of return on securities, relative, say, to the interest rate, the greater would be the demand for securities, and hence the greater would be their actual price. But how much greater would surely depend upon the state of excess reserves of the banks, i e, how much credit the banks can advance. This argument however does not hold symmetrically when the expected rate of return on securities is less than (or even equal to) the interest rate, because in such a case the actual price would get tethered to P^*. Denoting the state of excess reserves of banks by E (to be defined later), and some minimum critical level of excess reserves they wish to maintain by π we can say

$$P_t = P_{t-1} \cdot [1 + (E_t/\pi - 1)\,(j^e_t - i)] \text{ when } j^e_t > i,$$

$$\text{and } = P^* \text{ when } j^e_t \leq i \qquad \text{... (vi)}$$

The index of excess reserves of banks which figures in (vi) is an ex ante concept (relating to the end of the period) in the sense that it refers to the ratio between the maximum money-supply that the banks are capable of creating and the demand for money that would have arisen with the current period's income and the securities prices prevailing at the beginning of the period, i e,

$$E_t = \bar{M}_s / f(P_{t-1}, Y_t) \qquad \text{. (vii)}$$

where f is positive with respect to both the arguments of the function.

The maximum money-supply in turn depends on the following. Since the government maintains a fixed proportion of GDP as fiscal deficit, then in effect the magnitude of high-powered money which forms the reserve base of banks depends crucially upon the foreign exchange reserves of the economy. This determines the credit-creating capacity of the banks, and hence the potential money-supply in the economy, i e,

$$\bar{M}_s = (q.R_t/e) \qquad \text{(viii)}$$

where q is taken (as a first approximation) to be a constant and e is the price of the domestic currency in terms of foreign exchange.

The net foreign capital inflow must equal the current account deficit plus the addition to foreign exchange reserves. I assume that imports bear a given ratio to income and that exports bear a given ratio to the magnitude of world trade, both ratios being dependent on the exchange rate; I also assume that the investment-income outflow is the cumulative net foreign capital inflow times the interest rate We thus have

$$F_t = D_t \,.\, i + m(e) \quad Y_t\, e - h(e).W_t + R_t \quad R_{t-1} \qquad \text{. (ix)}$$

where W_t is the total value of world trade and

$$Dt = \sum_{0}^{t-1} F_t \qquad \text{(x)}$$

Now, using superscript g for the government and p for the private sector, we have the following national income identity

$$Yt = C^p_t + C^g_t + I^p_t + I^g_t + X_t - M_t - D_t \,.\, i/e.$$

If we assume that government consumption, government investment and taxation bear fixed proportions to income, denoted respectively by n, μ, and t (so that the deficit is a fraction d = n + μ − t of income), and that private savings are a fixed proportion of post-tax income, and hence, by virtue of our assumption about the tax ratio, a fixed proportion s of total income, then the level of income is given by:

$$Y_t = (I^p_t + h(e).W_t/e - D_t.i/e)/(s-d+m) \qquad \text{... (xi)}$$

For private investment we assume that there is a one-period lag between investment decisions and actual investment and that the magnitude of private investment decisions in any period (and hence actual investment in the next) relative to the total capital stock in the economy depends upon the level of capacity utilisation in the economy and the expected rate of return on holding financial assets in the following manner

$$I^p_{t+1} = \alpha(r^e_t)\,(u_t - u_0) \quad K_t \qquad \text{... (xii)}$$

where K denotes the total capital stock in the economy, u_0 is some critical level of capacity utilisation, $\alpha'(r^e_t) < 0$, and

$$u_t = O_t / \beta .\, K_t \qquad \text{(xiii)}$$

β being the technologically-determined output-capital ratio.

The level of output, as distinct from income, is

$$O_t = Y_t + D_t \,.i \qquad \text{... (xiv)}$$

Total investment is the sum of private and public investments, so that

$$I_t = I^p_t + \mu .\, Y_t \qquad \text{... (xv)}$$

And finally, we ignore depreciation, so that

$$I_t = K_{t+1} - K_t \qquad \text{... (xvi)}$$

This completes our system of equations. Let us turn now to an analysis of the system.

V

The investment-output story told in this model is a variation of Kalecki's well known model of the early-30s, which has been analysed extensively.[5] The variation is in respect of three things: first, we are talking about an open economy; secondly, we have net capital inflows on which there are investment-income outflows, because of which output and income of the economy are not synonymous terms; and thirdly, we have the rate of return on financial assets entering into investment decisions. In our model, for any given rate of return on financial assets, i e, for a given value of α, the behaviour of investment through time would be captured by an equation of the following sort:

$$I_t = a' I_{t-1} + a'' X_{t-1} - a''' D_{t-1} - b' K_{t-1}$$

If exports and interest payments always happened to grow at the same rate as output in the economy, then there would be steady-state growth provided that a' was sufficiently large and of course greater than 1 relative to b'.[6]

Using this result, we can in fact analyse the steady-state possibilities of our total system (given by the 16 equations), consist-

ing of the real as well as the financial sectors. If the erratic element entering into expectations of security-prices is ignored, i e, $\epsilon = 0$, then the system can give a steady state result in the sense of equal rates of growth of foreign capital inflow, of income, of output, of capital stock, of cumulated net capital inflows and of reserves, only if the following conditions are satisfied (i) there exists some level of the administered interest rate at which, if it prevailed as the rate of return in the economy, the rate of growth of net foreign capital inflow is the same as the rate of growth of investment and ouput, (ii) the growth of world trade happens to coincide exactly with this rate of growth and (iii) the level of the initial net capital inflow to that of the initial debt is exactly equal to this growth rate

Now satisfying these conditions is of course a tall order But let us for a moment deliberately make assumptions such that a steady state exists Let us assume that the level of the exchange rate, instead of affecting the share of the country in an autonomously growing world trade, actually affects the rate of growth of exports so that the obstacle represented by condition (ii) is overcome through the choice of an appropriate exchange rate Let us also assume that the ratio of the fiscal deficit to income can be chosen at will in which case by manipulating d in eqn (xi) any rate of output growth (within a range of course) can be achieved by the government for a particular level of the interest rate And finally let us assume that the initial conditions i e the ratio of I to D_0 are such that they admit the possibility of a meaningful steady state growth rate to be brought about through the manipulation of the policy variables Then, by manipulating the three policy variables at its command, namely, the interest rate the exchange rate, and the ratio of the fiscal deficit to income, the government can achieve a steady state path

This path, however, would be an unstable one, in the sense that if the expected security prices happen to exceed the floor level for some reason, then the boom in the security market would continue for some time until the security prices collapse back to the floor level Moreover, once we introduce the erratic element i e $\epsilon \neq 0$, then even if the government sets its three policy variables in such a manner that a steady state path would be attained in the absence of the erratic element, its presence would necessarily ensure that the economy would never be on the steady state path Instead, it would show fluctuations of the following kind erratic factors, which operate in only one direction when security prices are at their floor level, would start a stock market boom, whose consequence would be to attract larger net capital inflows, even as productive investment is adversely affected This would go on until the stock-market boom collapses owing to liquidity-shortage (if chance factors do not intervene in the interim), and security prices collapse to the floor level, but they would not stay at the floor-level, where steady state growth could, in principle, be experienced, because erratic factors would dislodge the economy once again from this perch

The average state of affairs through these fluctuations would be a lower rate of income growth than on the steady state and a higher level of reserves But even this is not enough Since with higher reserves in any one cycle, a more pronounced stock market boom can be sustained in the next cycle, the stock-market fluctuations would *ceteris paribus* become larger and larger in amplitude, and correspondingly the rate of growth of income would become smaller and smaller In short even when the government has full freedom to choose its policy variables, even when we abstract from all considerations of commodity price inflation, even when we assume that any export growth rate can be achieved simply by fixing the appropriate exchange rate and even when we assume that the government is both wise and knowledgeable enough to choose its policy variables in a manner so as to achieve steady state growth the actual behaviour of the economy would be to proceed towards economic atrophy combined with growing foreign exchange reserves and stock market booms of larger and larger amplitude If of course steady state growth is not possible or the government does not have sufficient freedom in fixing its policy-variables, then the behaviour of the economy would become even more bewildering, bizarre, and, in all likelihood, detrimental to growth

A typical illustration of this latter situation is where the interest rate has to be set so high in order to attract net capital inflows that the required magnitude of the fiscal deficit for ensuing a corresponding output growth-rate turns out to be impossibly high This may not merely be because of pressures from the IMF and other such bodies It may have to do with the fact that substituting government bonds for foreign exchange reserves in the portfolio of the banking system would build up a serious inflationary potential as far as the commodity markets are concerned which would get realised in the event of a stray supply failure, and such a denouement would be more likely if the increase in the fiscal deficit is used not for purposes of investment, but for stimulating consumption, either of the government itself, or of the private rich through tax-cuts Since this latter is usually the only way open to the government in a 'liberalised' economy for stimulating economic activity, the strait-jacket which such a policy sets up for itself is obvious

VI

The fundamental fallacy underlying the argument for this sort of 'globalisation' is the premise that productive investment has

become highly mobile across the world and that if only the economy is 'liberalised' in the manner approved of by the Fund and the Bank, rapid industrialisation would follow. As a matter of fact what has become highly mobile across the world is not productive capital but finance capital, especially in the form of hot money. It is speculative funds rather than direct foreign investments which have flowed into our economy, notwithstanding all the talk of how many foreign investment proposals have been approved; and even such DFI which is coming into the economy is for capturing our market rather than for using our soil in order to manufacture for the world market. In fact, one can go further. The very profitability of speculation acts as a deterrent to all productive investment, i e, while we wait for 'liberalisation' to produce its bonanza the economy actually retrogresses.

But this deterrence, it may be thought, acts only in the case of the domestic private sector. If foreign exchange is coming in, why can it not be converted to productive capital through the intermediation of the state? The answer to this question which has been at the centre of this paper consists of two parts: first, it is risky in any case to use hot-money as the basis of an investment-drive. A country which does so is in effect 'borrowing short to invest long', i e, getting into a more and more risky portfolio-mix. But, important though this consideration is, it is not overriding. The state could always choose a pattern of investment, eg, in quick-yielding projects which have the effect of raising supplies of potentially-exportable commodities (raising agricultural output would be a good example) which minimises the risks of an investment drive.

The more serious constraint arises from the fact that under the logic of 'liberalisation' the state is withdrawing from the role of a principal player in the arena of production itself. *As a result, 'liberalisation' leaves the economy without any agency capable of transforming potentially investible resources into actual productive investment, i e, capable of using the 'slack' in the economy to set up its rate of growth.* Direct foreign investment does not flow in, to any significant extent, to take advantage of global markets; domestic private investment dwindles owing to low inducement to invest (which removal of protection entails) and the greater profitability of speculation; and the state progressively reduces its role as an investor. Not surprisingly, economic atrophy ensues even as speculation thrives and foreign exchange reserves accumulate.

Under these circumstances, the state may be tempted to do what the 1994-95 budget has in fact done, namely, to try and reflate the economy by stimulating luxury consumption through tax-cuts for the rich. But this represents the worst of all possible worlds. It does not add to productive investment and hence the growth-potential of the economy; it adds very little to aggregate demand (because of large import 'leakages') and hence employment through the multiplier; it fritters away foreign exchange reserves; it greatly increases the riskiness of the country's portfolio-mix: if 'borrowing short and investing long' is itself a risky policy, 'borrowing short and not investing at all' is of course far worse; it greatly increases the inflationary threat to the economy because the liquidity-overhang caused by the fiscal deficit is not matched by any additional capacity-creation; and finally, the fiscal deficit created with this rather unedifying objective of stimulating luxury consumption not only accentuates consumption (i e, 'flow') inequalities in society, with detrimental consequences for social stability, but, in common with any fiscal deficit as Kalecki had argued long ago, also worsens wealth inequalities.[7]

If the dead-end that macro-economic policy has run into is a consequence of the regime we have adopted, the question naturally arises: what specific lessons can we draw from our experience? To say that we live in a world of highly mobile finance capital and that we have to strategically relate to such a world is quite different from saying that we should open our economy to the untrammelled operations of such capital. The former amounts to the recognition of a valid constraint that the existence of powerful international rentier interests pose to any national economy; the latter amounts to prostrating the economy before such interests whose 'euthanasia' as Keynes had underscored[8] is essential for the revival of productive activity. It is scarcely surprising that only those economies in the third world which, whether by accident or by design, have managed hitherto to keep international rentier interests at bay, have performed remarkably in terms of growth; China is an obvious example in this context.

Any macro-economic policy of course has to be a part of an alternative development strategy. I have discussed elsewhere what the contours of such an alternative development strategy should be and shall not repeat that discussion here.[9] But the macro-economic policy supporting such an alternative must eschew at least three specific aspects of the current policy-direction: namely, the move towards freeing capital movements, the move towards financial liberalisation, and the move towards withdrawing the state from the arena of production. Reversing policy in these spheres to be sure would require complementary reversals in policy elsewhere as well, but these represent the proximate elements behind the transformation of the economy into one where international rentier interests exercise hegemony. Both the problems highlighted in the model presented earlier, namely, the problem of the instability of the growth-path leading to atrophy over time, and the problem of having to maintain an interest-structure which is so high that it chokes off productive investment, are ultimately related to these three elements. Encouragement for export-oriented DFI should be provided with a selective set of measures, as the Chinese have done, without going through the gamut of 'liberalisation' measures which turn the economy into a playground for speculation by international rentier interests; if such DFI comes in response to these selective measures, well and good, if it does not then so be it. More generally, the need today is for intelligent, selective and discriminating measures, not for enacting the cliches of a pre Keynesian *laissez-faire* discourse.

Notes

1 I have argued along these lines in Patnaik (1991).
2 This of course is an old argument advanced in the context of economies like Britain by Keynesian economists. See for example, Robinson and Eatwell (1974).
3 For the behaviour of productive innvestment during the Reagan boom, see Sweezy and Magdoff (1987)
4 The model outlined here is an offshoot of joint work-in-progress with Jayati Ghosh, who however should not be held responsible either for the specific form of the model or for the manner in which it is used in the current paper.
5 See, for instance, Oskar Lange's 'Mr Kalecki's Theory of the Business Cycle' reprinted in Lange (1970).
6 In such a case there would be two possible steady-state growth rates, the smaller of which would represent an unstable trend. In the discussion which follows we therefore ignore this unstable trend. It can be verified that the stable trend rises with a rise in the ratio of fiscal deficit to total income.
7 Kalecki's argument that deficit financed government expenditure is worse from the point of wealth-distribution than tax financed government expenditure is contained in Kalecki (1971), pp 84 86.
8 See Keynes (1936), Ch 24.
9 See Patnaik (1994)

Money and Public Finance under Structural Adjustment

The Indian Experience

Mihir Rakshit

The Economic Survey *1993-94 and the Budget papers for 1994-95 display inadequate appreciation of the macro-economic mechanism giving rise to a series of paradoxes which have characterised the Indian economy since the initiation of the Structural Adjustment Programme in July 1991, and during 1993-94 especially.*

In order to identify the economic forces behind the emerging scenario this paper takes the developments in the financial sector as its point of departure, mainly because the primary concern of the government remains reduction of the fiscal and monetised deficits. Section II of the paper summarises the behaviour of money and credit during 1993-94 and draws attention to some serious limitations of the official explanations of some financial developments.

Section III attempts a resolution of the paradoxes taking into account the interaction between the financial and the real sectors. In terms of the analytical framework used in this context, Section IV provides a critique of the budgetary proposals for 1994-95 and suggests some policy alternatives.

The final section summarises the main results.

We must beware of Sirens' song and give their flowery meadow a wide berth I alone, Circe suggested, might listen to their voices, but you must bind me hard and fast, so that I cannot stir from the spot where you will stand me, by the step of the mast, with the rope's ends lashed round the mast itself. And if I beg you to release me, you must tighten and add to my bonds.

—*Odyssey*, Book XII.

I propose to phase out the government's access to *ad hoc* Treasury Bills over a period of three years. In 1994-95 the net issue of *ad hoc* Treasury Bills should not exceed Rs 9,000 crore for more than 10 continuous working days at any time during the year. If this happens the Reserve Bank will automatically sell Treasury Bills in the market to reduce the level of *ad hoc* Treasury Bills.

—Budget Speech, Finance Minister, Government of India, February 28, 1994.

I
tate of the Macro-Economy: Some Puzzling Features

NCE the initiation of the Structural Adstment Programme (SAP) in July 1991, pecially during 1993-94, the Indian onomy has displayed a number of intering features which have important implitions for fiscal and monetary policies. rst, for the first time since 1969, there pears to have occurred a switch from a gime of credit rationing to a situation of mand constraint in the loan market. Second, the excess liquidity in the system has iled to stimulate production and does not em to have had a significant impact on ices either (Table 1). Third, the increase in mmercial bank credit to the government s been far in excess of the requirement under the statutory liquidity ratio (SLR) (Table 2) Fourth, the fiscal deficit, after registering a decline in the first two years of SAP, has shot up to 7.3 per cent of GDP this year Indeed, if one does not use the trick of (a) clubbing revenue receipts with some capital receipts like recoveries of loans and sale proceeds of shares in public sector undertakings and (b) excluding market borrowing by public enterprises in the absence of loans routed through the treasury [Rakshit 1991], the fiscal deficit will be close to 9 per cent of GDP. However, contrary to the conventional wisdom this rise in fiscal deficit has been accompanied by a significant decline in current account deficit from 2.1 to 0.5 per cent of GDP between 1992-93 and 1993-94 (Table 1). Fifth, the gross domestic saving ratio declined from 24 to 22 3 per cent during 1990-93. The decline in private saving was steeper—from 23 per cent to 20.2 per cent—and occurred in the face of substantial tax concessions, especially in respect of income and other direct taxes (Table 1). Finally, production in the capital goods sector has fallen by 8.8 per cent during 1993-94 even though banks are flush with funds; the corporate sector raised Rs 29,000 crore from the primary market during 1993 (against Rs 16,600 crore in 1992), and there has been substantial inflow of foreign funds by way of Euro-issues by Indian companies and foreign direct and institutional investment What is no less important, despite the favourable turn of events on the trade front and the jump in foreign exchange reserves from $ 2 24 billion on April 1, 1992 to $ 13 billion by the third week of February 1994, the flow of foreign direct investment has been quite modest and the credit rating of India remains as low as it was in 1991.

An examination of the factors behind these developments appears necessary for an assessment of the policy package proposed by the ministry of finance. The importance of such an examination assumes urgency in view of the fact that the *Economic Survey 1993-94* and the Budget papers for 1994-95 display inadequate appreciation of the macro-economic mechanism giving rise to the paradoxes noted above. In order to identify the economic forces behind the emerging scenario we take the developments in the financial sector as our point of departure, mainly because the primary concern of the government remains reduction of fiscal and monetised deficits and the finance minister has proposed automatic sale of Treasury Bills by RBI when its net credit to the government crosses a pre-specified limit. Section II summarises the behaviour of money and credit during 1993-94 and draws attention to some serious limitations of the official explanation of some financial developments. Section III attempts a resolution of the paradoxes taking into account the interaction between financial and real sectors. In terms of the analytical framework used in this context, Section IV provides a critique of the budgetary proposals for 1994-95 and suggests some policy alternatives. The final section summarises the main results

II
Excess Liquidity and Its Manifestations

The most striking development in the financial sector during 1993-94 was the emergence of substantial excess supply. While it is not easy to provide a quantitative estimate of the extent of excess supply in the

loan market, the symptoms of demand constraint faced by banks and other financial intermediaries are clearly revealed in the following developments.

During April-January 1993-94 the growth of reserve money, currency with the public and money supply (M_3) were 20.4, 16.1 and 14.1 per cent respectively (Table 2). Thus the fairly steep fall in the (incremental) money multiplier occurred not only in the face of a cut in cash reserve ratio (CRR) on net total demand and time liabilities (DTL) and of the removal of 10 per cent incremental CRR imposed earlier but also when the growth rate of currency with the public lagged far behind that of reserve money. Under the standard analysis these factors should have raised significantly the value of the incremental money multiplier. Indeed deposits with scheduled commercial banks increased by only 13.8 per cent against a more than 25 per cent rise in their holding of reserve money. Rough and ready calculations on the basis of the prevailing base and incremental CRRs suggest that in the absence of any demand constraint in the loan market the additional amount of bank deposits and credit (in all forms) during the first 10 months of 1993-94 could have been larger by more than Rs 15,000 crore.[1]

Second, excess supply in the loan market has also been manifested in the remarkable change in the portfolio of scheduled commercial banks. During April-January 1993-94 non-food advances -constituting the most profitable asset of banks– rose by only 4.2 per cent while 'investments' recorded a growth of 18.8 per cent (Table 2). Priority sector advances in fact declined by Rs 210 crore while investment in government securities jumped by Rs 18,796 crore against an increase of Rs 8,764 crore in the corresponding period in 1992-93 (*Economic Survey 1993-94*, p 38). The interesting thing to note in this connection is that under SAP, reductions in SLR and CRR are deemed essential for diverting bank credit away from the government to finance productive investment in the private sector. However, while the incremental SLR has been reduced to 25 per cent the rise in the ratio of investment in government securities to additional bank deposits during 1993-94 has been more than 50 per cent.

Third, symptoms of excess liquidity are also in evidence outside the banking sector. Large companies have repaid a substantial part of their debt in advance of the maturity date and/or invested their funds in units of the Unit Trust of India (UTI). UTI is having trouble with finding suitable outlets for its funds, has been forced to buy Commercial Paper and refused to accede to the request of companies for premature retirement of non-marketable debentures acquired through special placement.

Finally, excess liquidity has caused a decline in interest rates, but by not enough to eliminate excess supply in the loan market. Of the three interest rates figuring in Table 3, only the call money rate may be regarded as market clearing and the fall in this rate is also the steepest. However, the significance of this interest rate in effecting the flow of funds from the savers to the ultimate users of credit is severely limited. Of crucial importance in this regard are the institutional lending rate and the (minimum) interest on bank loans both of which are administered. The administered rates have, to be sure, responded to market forces but the response has been sluggish and far from perfect (Table 3).

Official Misperceptions of Financial Developments

Before explaining the features noted above and seeking to relate them to factors operating in the real part of the economy, it is useful to clear the deck by dispelling some serious flaws in the official perception of current financial developments. The explanation of the ministry of finance of the slow growth of commercial bank credit, especially non-food advances, runs partly in terms of adherence to 'prudential norms' by banks in advancing loans, but mainly in terms of the rise in the yield on government securities and the zero risk weight assigned to them under the new norm (*Economic Survey 1993-94*, pp 38-39). The rise in fiscal deficit has in fact been identified as the villain of the piece. "An important underlying reason for the limited increase in credit to the non-food commercial sector is the large borrowing requirement (fiscal deficit) of the government. A high fiscal deficit has led to high interest rates on bank advances to commercial sector, which has made some investments unviable, and also pushed the private sector looking for other sources of finance. Containment of fiscal deficit is therefore, an important policy tool for freeing bank resources for injection into the agriculture, industry and commerce" (*Economic Survey 1993-94*, p 39).

Note first that during the period under consideration the return on government securities was around 11.5 per cent against the then prevailing minimum lending rate of 15 per cent on bank advances. Be that as it may the official explanation would have made sense only if banks were fully loaned up or not burdened with excess reserves. We have drawn attention to the low growth of deposits in relation to accumulation of reserve money by banks, even though the base CRR was reduced and the requirement relating to incremental CRR withdrawn. We have also provided a rough and ready estimate of the excess supply of bank credit. Indeed, excess reserves have induced banks to buy Commercial Paper at a yield of 11.5 per cent in violation of the tacit agreement that the yield should be 12.5 per cent. The point to note here is that even at the minimum lending rate there was not enough demand for loans by creditworthy borrowers to absorb the potential supply of bank advances. Un

der these circumstances increased investment in government securities by banks was not at the expense of bank advances to the commercial sector: a reduction in fiscal deficit would have raised excess reserves in the banking system without any enhanced deployment of bank resources to industry, agriculture and commerce.

The most curious aspect of the explanation offered by the ministry of finance is its eloquent silence on the link between depressed conditions in industry and agriculture on the one hand and poor growth in bank advances on the other. Indeed, the phenomenon of the change in the relative importance of 'investments' in gilt-edged securities and advances in the portfolio of commercial banks during depressions has also been observed in countries like the US [Bernanke 1983]. The basic flaw in the finance ministry's view arises from not taking account of the fundamental difference in the economic mechanism under a regime of credit rationing and in a situation where the demand constraint is binding in the loan market. An implication of the official reading of the situation is that here causation has run from low bank advances to stagnation of industrial and agricultural output, rather than the other way round. An instructive illustration of preconceived theories distorting the view of the observer.

III
Towards a Resolution of Some Macro-Economic Paradoxes

Given the fairly widespread misconceptions regarding the links between budgetary operations and the behaviour of the financial and real sectors, we propose to summarise first the major elements of the theoretical framework that appears relevant for explaining some of the puzzling developments of the Indian economy during 1993-94. For simplifying the exposition we focus initially on the demand and supply sides of the credit market and suggest how the factors operating on the two sides are related with the rest of the economy.[2]

Demand and Supply Constrained Regimes in the Financial Market

When interest rates are administered (as most of them are in India) or are slow to adjust, the loan market is characterised by a regime of credit rationing (CR) or of demand constraint (DC).[3] The importance of distinguishing between CR and DC arises from the fact that the behaviour of the economy and the effects of fiscal and monetary policies differ widely under the two regimes.

Whether the loan market will be characterised by CR or DC depends on the constellation of major economic forces operating in the credit as also the commodity market. Consider first the behaviour of the credit market. On the supply side it is useful to distinguish between two categories of loans, viz, bank and non-bank loans, and the latter may further be subdivided into (a) direct loans from savers to investors and (b) loans routed through non-bank financial institutions. At given interest rates and no demand constraint, the maximum potential supply of bank credit, *a la* the textbook money multiplier analysis, is determined by the supply of reserve money, cash reserve ratio and the demand for currency by the public. The potential supply of non-bank credit depends on the other hand upon the menu of financial assets available outside the banking sector, the structure of interest rates and the preference of the public between bank deposits and other forms of financial assets. An increase in reserve money, a scaling down of cash reserve ratio or a decline in cash drain from the banking system augments the supply not only of bank but also of non-bank credit. Development of the capital market, financial innovation, introduction of new instruments of credit outside the banking sector and an increase in yields on non-bank financial assets (supplied by the government, the corporate sector or non-bank financial institutions) relatively to interest rates on bank deposits--all tend to raise the relative importance of non-bank to bank credit. But this, contrary to the apprehension voiced by many a banker, does not entail disintermediation or a decline in the volume of bank deposits and credit [Rakshit 1986, 1993].

The major users of credit are the government, producers and investors. While the borrowing needs of the government may, as a first approximation, be regarded as a policy variable, the rest of the demand for credit is primarily for financing working capital and investment in fixed capital. Capital accumulation has not only a direct impact on the demand side of the credit market, but growth in investment also raises indirectly the demand for production loans with the operation of the investment multiplier in real or nominal terms.

Given the structure of interest rates and financial network in the system, the loan market will be characterised by CR or DC according as the aggregate demand for credit exceeds or falls short of the total supply of bank and non-bank credit.[4] Under credit rationing some of the production and investment plans remain unfulfilled. The result is a supply-side or a demand-side failure in the commodity market depending upon whether it is the producers or investors who are quantity constrained in the loan market [Rakshit 1986; Blinder 1987]. When the economy is characterised by credit rationing, government borrowing through SLR has a one-to-one crowding-out effect, but government expenditure through monetised deficit will have a (financial) crowding-in effect through the operation of the credit multiplier within and outside the banking system. When fiscal deficit is financed through the introduction of high yield assets like National Savings Certificates or funds are routed to borrowers (public or private) through establishment of Mutual Funds or other financial innovations, the supply of non-bank credit rises without any decrease in bank deposits and credit. Again, an across the board change in the lending rates of banks and financial institutions has little impact on the system; but an increase in interest rates on bank deposits relatively to that on other financial assets reduces non-bank credit with no significant change in the supply of bank loans.

Radically different are the effects of fiscal deficits and monetary policies when the loan market is demand constrained. Under such a regime it is the aggregate demand for loan and its distribution that determine the levels of bank and non-bank credit. Additional holding of government securities by banks then does not have a crowding-out effect. The value of both the money multiplier and the credit multiplier (the incremental ratio of total credit to reserve money) assumes the value of unity.[5] When the government or private borrowers raise funds from non-bank sources, there occurs a corresponding decrease in money and bank credit.

Evidence and Theory

In terms of the framework outlined above, it is not difficult to resolve some of the puzzles listed in Sections I and II and to identify the sources of the fallacy in official reasoning. In the list of factors held responsible by the ministry of finance for slow growth of bank advances during 1993-94 (*Economic Survey 1993-94*, pp 38-39), some operate under CR and others under DC; but the two sets of factors cannot operate simultaneously.[6] Hence our dismissal of fiscal deficit, of 'provisioning and capital adequacy norms' set for bank loans[7] and of the reduction in the gap between the banks' minimum lending rate and yield on government securities, as explanatory factors when the loan market is characterised by demand constraint.

To appreciate the behaviour of the system consider first the supply-side factors operating in the financial market. Between March 31, 1993 and January 7, 1994 the potential supply of bank credit increased substantially because of (1) the rise in reserve money by 16.9 per cent (the rise was 20.4 per cent during March 19-January 14); (2) a lower growth rate of currency with the public (viz, 16.1 per cent) *vis-a-vis* that of reserve money; and (3) a cut in CRR from 15 to 14 per cent along with removal of the 10 per cent incremental CRR imposed earlier. The net RBI credit to the government increased by Rs 8,686 crore compared with Rs 7,491 crore during the corresponding period in the previous year. Of the Rs 18,731 crore change in reserve money, net foreign exchange assets of RBI (excluding revaluation of gold) accounted for Rs 11,270 crore against (-)Rs 3,261 crore in March 31-January 8, 1992-93 (*Economic Survey 1993-94*, p 37). If we ignore the feedback from the commodity market through the incremental cash drain from banks, the *ex ante* variation in money supply (M_3) or total credit from the banking system (including RBI) was about Rs 65,000 crore while the *ex post* variation amounted only to Rs 51,279 crore.

Given the structure of the capital market and the returns on all financial assets, an increase in M_3 is associated with a more or less proportional rise in non-bank credit as well. But the capital market itself has been undergoing rapid changes over the last few years. Some of the factors—eg, growth of the equity cult, introduction of convertible debentures, new schemes for attracting funds initiated by the government, UTI, LIC and other financial intermediaries, and setting up of mutual funds and finance companies—have been in operation since the mid-80s and were instrumental in raising the value of the credit multiplier and in offsetting to some extent the crowding-out effect of growing fiscal deficits under the regime of credit rationing prevailing until fairly recently [Rakshit 1994]. Of special significance for the current scenario are the following developments during 1992-94:

(1) Repeal of Capital Issues (Control) Act, 1947 and removal of control over price and premium of shares.

(2) Permission to Indian companies to tap the international capital market through Euro-equity shares.

(3) Extension of facilities to non-resident Indians and overseas corporate bodies for subscribing to shares and debentures of Indian companies.

(4) Permission to Foreign Institutional Investors (FIIs) to invest in the Indian capital market on registration with Securities and Exchange Board of India (SEBI).

(5) Setting up of private mutual funds and finance companies.

These factors have produced a significant structural shift in the capital market: given favourable conditions the potential supply of funds from non-bank sources can now increase enormously in relation to M_3. During 1993-94, the favourable circumstances consisted of: (a) stock market boom leading to a sharp rise in the average price-earning ratio of shares; (b) recession in major industrialised countries; and (c) higher interest rates in India compared with those prevailing in the international money market. The conjunction of these events with the revised rules for the capital market under SAP has led to a substantial rise in the supply of funds from the primary market and in the inflow of foreign capital, mainly through Euro-issues and foreign institutional investments. During April-December 1993 the corporate sector is reported to have raised from the primary market Rs 21,600 crore compared with Rs 16,500 crore during the calendar year 1992. Add to that the issue of Commercial Paper by companies and enhanced access of importers to suppliers' credit due to recession in advanced countries, and it is not difficult to explain the jump in the availability of funds outside the banking system.

So far as the demand side of the loan market is concerned, the major increase has come from the government sector. Fiscal deficit rose from Rs 40,173 crore in 1992-93 to Rs 58,511 crore in 1993-94 (*Budget at a Glance*, 1994-95, p 1). Even allowing for the supply side effects of monetised deficit (via money and credit multipliers), budgetary operations seem on the whole to have had a larger impact on the demand than on the supply side of the credit market. The demand has also been boosted by the increase in public food procurement credit to the tune of Rs 4,336 crore during March 19-January 7, 1993-94 (against Rs 824 crore during the corresponding period in 1992-93). The explanation of excess supply in the credit market thus lies primarily in inadequate increase in demand from the commercial sector which in its turn may be traced to (a) stagnation in agricultural and industrial output; and (b) slow growth in investment, especially in gross fixed capital formation. Since an increase in the availability of credit has generally a favourable impact on production and investment, it is necessary to take into account the interdependence between the credit and the commodity markets. This we propose to do in the course of the resolution of puzzles noted in earlier sections.

Excess Liquidity, Composition of Bank Assets and Money Supply

The simplest puzzle to resolve in terms of the framework presented above is the change in the composition of bank assets, making inoperative the reduction in SLR. With inadequate demand for loans from the commercial sector, it is only natural for banks to lap up government securities in order to reduce their excess reserves, even though the return on these securities is less than the minimum interest rate on bank advances. Again, while stagnation of agricultural and industrial production has had an adverse effect on aggregate demand for credit, the effect has been much more pronounced on the demand for bank advances. The major part of bank loan is used for financing working capital and the variation in this source of demand depends primarily on the growth of agriculture and industry, and not so much of services (where production loan per unit of output tends to be lower than that in the commodity producing sectors). However, the variation in non-food advances (in nominal terms) during 1993-94 was only 4 2 per cent while the inflation rate was about 9 per cent The implication is that bank advances were not enough to sustain the production level reached in 1992-93. The explanation lies partly in the reduction in the use of fertiliser, but mostly in the switch from bank to non-bank sources of funds Under conditions of excess supply in the loan market, such a switch reduces the *ex post* supply of money as also the ratio of advances to 'investment' in the portfolio of banks. The phenomena of the fall in the incremental money multiplier and the change

Table 3. Interest Rates, 1992-94

	Institutional Lending Rate	Call Money Rate	Banks' Minimum Lending Rate
December 1992	17.5	10.5	18
December 1993	15.5	5.5	15
March 1994	14 5	2.0	14

Government of India, *Budget Speech, 1994-95.*

in the composition of bank assets are thus related both to the aggregate excess supply situation in the credit market and the substitution of bank loans by funds from other sources.

There appears in fact to have occurred a shift in the demand for credit by the commercial sector away not only from banks but also from the all-India financial institutions (AIFIs). Disbursements by AIFIs during April-December 1993 was only Rs 14,755 crore against Rs 15,393 crore during April-December 1992 (*Economic Survey 1993-94*, p 47). This works out to a more than 10 per cent decline in real terms and is due partly to inadequate demand for long-term investment. However, the corporate sector, as noted earlier, has at the same time mobilised substantial funds through capital issues in the domestic and international markets, and through issue of Commercial Paper.[8] Thus for AIFIs and banks the overall problem of demand constraint has been compounded by the shift to alternative sources of finance. In fact the corporate sector has used some of the funds mobilised to repay (and often prepay) debts contracted earlier. The amount of repayment during 1993-94 is expected to be Rs 10,000 crore which, if realised, is estimated to reduce the interest cost of the corporate sector by Rs 1,500 crore per annum and would add consequently to the woes of financial institutions (*The Economic Times*, January 28).

The most important reason for the shift away from institutional credit lies in the sharp change in the relative cost of finance from different sources. Interest rates on domestic loans in the wake of financial liberalisation under SAP were between 20 and 22 per cent, while some forex loans carried interest in the range of 24 to 28 per cent. The jump in domestic rates was due to unfreezing of maximum lending rates in a situation of credit rationing and the interest on forex loans largely reflects the high risk premium under the serious balance of payments problem plaguing the economy in 1991-92. By 1993-94 the situation in both the domestic and the international capital market changed dramatically. The domestic money market displayed symptoms of excess supply; recessionary conditions drove down interest rates in developed countries; and there was considerable improvement in the external balance of India. However, the adjustment in institutional interest rates, which are administered, was extremely sluggish. By December 1993 the institutional lending rates and the minimum interest on bank loans[9] were brought down by only one to two percentage points to 15.5 and 15 per cent respectively (Table 3). By contrast, there was a steep fall in the cost of raising funds from other sources. The yield on Commercial Paper was 11.5 per cent, and would have been much lower had financial institutions not indulged in oligopsonistic practices. Interest rate on suppliers' credit to importers hovered between 2 and 3 per cent. Net earnings of companies as a ratio of the price of their shares came down to less than 4 per cent.[10]. Interest on Euro-convertibles was as low as 3.5 per cent. No wonder it paid the importers and the corporate sector to opt for these cheaper sources of finance at the expense of banks and AIFIs and to prepay debts contracted in the earlier period.

Excess Liquidity and Stagnation: Causal Links

The coexistence of excess liquidity and stagnation in agriculture and industry would appear odd to anybody steeped in mainstream macro-economics: a sharp rise in reserve money and the (*ex ante*) supply of credit outside the banking system should normally generate an expansionary effect on production and investment, at least in the short run. Part of the explanation of the puzzle lies in the fact that in mainstream models, Keynesian or monetarist, all interest rates are assumed to be market clearing. However, in India interest rates charged by financial institutions (including banks), which still constitute by far the most important suppliers of credit, are administered and have been characterised by extremely slow and modest adjustment in the face of excess supply in the loan market.[11] While the existence of sticky interest rates throws some light on the connection between the money and the commodity markets in the Indian economy a satisfactory resolution of the paradox requires us to distinguish between factors operating in industry and agriculture.

In explaining agricultural stagnation it appears appropriate to focus on the supply rather than the demand side factors.[12] We have already taken note of the decline in the cost of raising funds from non-institutional sources. But these sources could be tapped only by large producers in the organised sector, while the vast majority of farmers have still to rely on banks and monopolistic money-lenders in rural areas. Adherence to the newly formulated prudential norms for banks might thus have been responsible for the denial of production loans to a section of the farming community and hence for the adverse supply-side effect on agriculture [Blinder 1987; Rakshit 1986]. The 0.7 per cent (nominal) growth in bank credit to agriculture during April-August 1993 (*Economic Survey 1993-94*, p 39) lends some support to the hypothesis of sectoral (or sectional) credit rationing[13] operating in agriculture. The problem was aggravated by the steep rise in the prices of phosphatic and potassic fertilisers following their decontrol. While this rise in prices reduces the profit-maximising quantity of fertiliser consumption (with no shortage of funds), the decline will be larger for producers facing the credit constraint.

The main source of agricultural stagnation seems however to lie elsewhere. In fact, stagnation in agriculture has set in since the late 80s and continued in the 90s in spite of a long spell of favourable weather conditions. The period 1990-94 was characterised by above average monsoon in all the years, but agricultural growth averaged only 1.1 per cent per annum against a more than 2 per cent increase in population. The reason lies in decline in agricultural investment, especially since the late 80s [Rakshit 1994]. Gross investment in agriculture in real terms was Rs 4,636 crore in 1980-81, but came down to Rs 4,580 crore by 1991-92 (*Economic Survey 1993-94*, p 124). Thus while variations in monsoon, availability of credit or relative prices of outputs and inputs can account for some changes in agricultural production around the trend in 'capacity output', over the last half a decade the growth in capacity itself has been extremely sluggish due to the declining trend in investment-output ratio in agriculture.

So far as the industrial sector is concerned, excess capacity appears widespread; there is no shortage of production loan; nor are producers quantity constrained in respect of raw materials and components imported from abroad. For explaining the poor growth rate in industries we have thus to look for factors operating on the demand side. The improvement in trade balance during 1993-94 could conceivably have produced an expansionary effect. But the largest increase (amounting to 38 per cent during April-September 1993-94) occurred in the export of agricultural goods, the production of which is basically supply determined. It is also worth noting that out of the Rs 1,245 crore increase in exports of manufactured goods in April-September 1993-94, gems and jewellery accounted for more than 40 per cent. Anyway, the rise in export demand was too small to have any perceptible impact on domestic industrial sector. The largest boost to demand has been provided by the government. Between 1992-93 and 1993-94 central government expenditure[14] in real terms increased by about 7 per cent. No less important was the cut in tax rates and the steep fall in government revenue both in absolute terms and as a ratio of GDP.

The expansionary forces unleashed by budgetary operations were not however strong enough to counter the recessionary tendencies in the system. Reduction in direct taxes, cuts in duties on items of luxury consumption both directly and indirectly (through reduction in tariffs on their raw materials and components), large transfers[15] by way of interest payments and subsidies, and the stock market boom—all have tended

to benefit the middle and upper income groups, but not other sections of the community. The fall in agricultural production had in fact a negative effect on the demand for inputs and outputs supplied by the industrial sector. While the production of sugar is expected to go down by 5 per cent in 1993-94,[16] fertiliser output recorded a decline of 10.6 per cent in April-December 1993-94. That the latter was due to the demand rather than the supply side factor is attested by the fact that even under the liberalised regime, fertiliser imports fell by 36.9 per cent during April-September 1993-94 (*Economic Survey 1993-94*, pp 85, 105). Stockpiling by Food Corporation of India (FCI) at enhanced procurement prices and the rise in the quantity and prices of agricultural goods sold abroad seem to have benefited the rural rich. At the same time people in lower income groups must have been hit hard by the steep rise in issue prices of foodgrains and substantial addition to their stock by FCI.[17] These factors together with the boost to upper class demand provided by budgetary policies and the stock market boom[18] go a long way in explaining the change in the production of industrial consumer goods. During April-January 1993-94 the growth in consumer durables was 14.3 per cent,[19] while production of all consumer goods rose by only 1.4 per cent. There was in fact a negative growth (of -1.6 per cent) in the production of consumer non-durables.

The steepest fall (of -8.8 per cent) in output occurred in capital goods industries and may be attributed (proximately) to (a) low investment, especially in fixed capital, and (b) diversion of demand from domestic to foreign sources of supply. During April-January 1993-94, gross fixed capital formation in real terms is reported to have grown by only 1.75 per cent. The growth in investment in machinery and equipment seems in fact to be negative. The demand constraint faced by the producers of these goods was made more severe by the then prevailing structure of taxes and policies relating to capital goods imports. The customs duties on capital goods and project imports were much lower than those on raw materials and components required for their production. There were no countervailing duties to neutralise the excise and sales taxes imposed on domestic capital goods.[20] Finally, import of second-hand machines and availability of suppliers' credit to importers at very low rates of interest have caused further diversion of demand away from the domestic capital goods sector.

Low Capital Accumulation, Excess Supply of Funds and Stock Market Boom

The industrial recession is no doubt due partly to substitution of foreign for domestic capital goods; but much more important has been the stagnation of aggregate investment demand itself. This, in the context of the surfeit of finance at the disposal of the corporate sector and the prolonged increase in share prices, constitutes perhaps the greatest puzzle of the Indian economy in recent years.

We have already drawn attention to the fact that while banks and AIFIs are flush with funds, the corporate sector has raised substantial amount of capital from the primary market, both domestic and foreign. Part of this fund has been used for retiring old debts carrying high rates of interest. This of course is an eminently sensible step from the viewpoint of individual investors. Nor does it have any adverse macro-economic consequence when the substitution is between domestic debts. But companies have also used funds raised through Euro-issues to pay off their debt from internal sources or to reduce their borrowing from banks and AIFIs. This, it may be noted, is an instance of individual interest running contrary to the interest of the economy as a whole. To see why, note that given the demand constraint operating in the domestic money market, such substitution does not involve any increase in capital accumulation or future growth in GDP. There is only a redistribution of the operating surplus from domestic lenders to producers and foreign creditors. Though companies earn more profits, there is a decline in gross national product and the country is burdened with the problem of servicing foreign debt.

What is puzzling is not so much the liquidation of costly debts with cheaper funds irrespective of their source, but rather stagnation in investment notwithstanding the steep fall in the cost of finance. The phenomenon underlines bleak expectations of investors relating to prospective yields and seems to confirm the old adage used in the context of asymmetrical effects of monetary policies during depressions and booms: though a horse may be dragged to the river, it cannot be forced to drink; but you can always prevent it from drinking water.

If investors indeed take a dim view of future prospects, how are we to account for the stock market boom? The answer to the question can at best be tentative and may perhaps be sought along Keynesian lines. Decisions regarding fixed capital formation are based on considerations of long-term fundamentals, and such investment, being lumpy and irreversible, attracts high risk premium. For 'investment' in the share market on the other hand what matters is expectations regarding the short-run movement of prices.

The bullish sentiment in the stock market may thus be traced to the following set of factors: First, reductions in corporate income and capital gains taxes, and exclusion of shares from taxable wealth of individuals have raised the attractiveness of shares, especially of profit-making companies. Second, after abolition of control over price and premium of new capital issues, many companies have raised the ratio of dividend to profits in order to reduce the cost of raising funds from the primary market.[21] Third, liberalisation and decontrol of (product) prices have raised earnings of relatively efficient companies, though others have suffered in the process. The market sentiment has been guided, as is often the case, more by the record of star performers than by the overall profitability of the corporate sector. The bullish sentiment generated by the performance of the select group of companies has given a thrust to the share prices of other companies as well. Fourth, the market has come to expect more and more concessions from the government in view of its avowed policy of reducing over time all direct taxes to levels prevailing in advanced countries.[22] Fifth, easy availability of funds, especially against shares, has helped bullish operations in no small measure. Finally, the phenomenon of rising share prices, unsupported by long-run expectations of producers, seems to owe much of its origin to herd behaviour and to the benchmark of market expectations set by the dizzy height share prices reached during the scam days.

Investment and Public Policy

The perceptive reader must have realised that the factors listed above would hardly weigh much with hard-headed businessmen taking decisions on investment in fixed capital. They would no doubt be all praise for the finance minister for the bonanza by way of cuts in taxes on profits and capital gains. But what matters for investment is not simply the increase in net profit on current operations, but the expected (a) demand in relation to existing capacity, and (b) availability and/or prices of inputs used in the process of production. An analysis along these lines may provide some clue to the puzzle of low investment in the Indian economy.

Note first that to the extent expectations are influenced by current happenings, the endemic and substantial excess capacity, whatever be its source, cannot but have a depressive effect on investment climate. The irony of the situation is that it is the slow-down in public investment and government policies relating to capital goods imports that have resulted in the sharp fall in capacity utilisation of units producing capital goods and most of these units belong to the public sector.[23] Under the programme for reform undertaken by the government, it will not make sense to the management of these enterprises to go in for any project for expansion of capacity.

Second, government fiscal and other policies have no doubt given a thrust to the production of consumer durables. However, apart from the fact that the weight of these goods is relatively low in industrial output, their imports are still on the banned list. With the threat of demolition of the protective barrier looming large, it is idle to expect large-scale investment in these industries.

Third, an important development in this context is stagnation of agricultural output consequent upon the decline in investment in agriculture. The basic reason here, as widely suggested, is twofold: cutback in government investment in irrigation and related areas; and presence of strong complementarity between public and private investment in agriculture. In a country like India viability of balance of payments, price stability and prospects of industrial expansion depend crucially on the growth of agricultural output [Rakshit 1991, 1994]. The implication is that when investment decisions are based on the knowledge of relevant macro-economic linkages, *a la* Lucas et al, bleak expectations concerning agricultural growth cannot but act as a deterrent to capital formation in industries.

Fourth, attention has repeatedly been drawn to the danger of serious infrastructural bottlenecks in the medium and the long run due to inadequate investment in power, transport and communication. The gap created by the decline in public investment in these fields has, contrary to expectations of the government, not been filled by private investment. The reasons are not far to seek. Given the large size and indivisibility of infrastructural projects, private investors will consider them worthwhile only if they expect a substantial increase in the future demand for these services. But expectations in this regard are unlikely to be buoyant in view of stagnation of industrial investment, which in its turn is due in part to uncertainty relating to the future availability of infrastructural services. Such co-ordination failures cannot be corrected through reliance on the free play of market forces.

Finally, long-run investment is influenced considerably by producers' perception of both the ability and commitment of the government to promote growth and full capacity utilisation. While the government's commitment to reform and liberalisation appears undoubted, its pronouncements relating to its priorities and policies for tackling recession and promoting growth are unlikely to inspire much confidence in the medium and long-run prospects of development of the economy. It is thus not too difficult to explain why foreign direct investment has so far been so modest and credit rating of India remains low in spite of improvement in trade balance and substantial inflow of foreign funds into the stock market.

IV
Union Budget 1994-95: Short-Term Response and Long-Run Perspective

In analysing the budgetary proposals for 1994-95, it is useful to relate them to two basic questions. First, what are the policy response of the government in tackling the current problems of low capacity utilisation, slow growth and unabated inflation? Second, how far does the Budget reflect a well-thought-out programme of development of the economy and alleviation of poverty? While the implicit analytical framework behind government policies remains basically the same as that under the standard IMF-sponsored SAP, during 1993-94 there were, to the horror of the establishment, quite a few violations of canons concerning fiscal deficit, monetised deficit and food and fertiliser subsidy. Some of these violations, it is claimed, were part of a programme of macro-economic stabilisation in the context of the substantial slack prevailing in the economy. Let us see how far the budgetary measures for 1994-95 are addressed towards the solution of short-run macroeconomic problems and how or if these measures are dovetailed in the overall policy for long-term development of the economy.

Macro-Economic Stabilisation

If the government indeed raised the fiscal and monetised deficits in 1993-94 to counter the recessionary tendencies in the system, the budget for 1994-95 shows a reversal of policy in this regard. The absolute levels of fiscal and monetised deficits in 1994-95 are slated to go down by 8.5 and 50 per cent respectively from their corresponding amounts in 1993-94 (revised estimates). This turnaround in policy, in the face of persistence of slack in the economy, is perhaps due to the fact that these measures were found ineffective (or even counterproductive) in tackling recession during 1993-94! The more charitable interpretation is that the net effect of all the budgetary measures taken together is considered expansionary in spite of the significant cutback in fiscal and monetised deficits. Let us consider the major provisions in the Budget that can have important effects on the short-run macro-economic behaviour of the system.

The direct impact of the budget in stimulating aggregate demand will be negative on two counts. First, while total government expenditure in nominal terms is to increase by 5 per cent, increase in revenue receipts is expected to be 13 per cent. With a 9 per cent inflation rate, this implies in real terms a decline in government expenditure by 4 per cent against a 4 per cent rise in revenue collections. Again, while the estimated increase in government expenditure is Rs 7,827 crore, the increase in interest payments by Rs 8,500 crore tilts the balance in favour of transfer payments against government demand for final goods and services. Thus given the size of the central government budget in relation to GDP,[24] there will be a sizeable contractionary impact, if the government can attain its expenditure and revenue targets.[25]

Second, in a situation of demand constraint in the loan market, government capital receipts, as our analysis in Section III shows, do not have a significant effect on aggregate demand eitherway. However, the lower growth in RBI credit to government along with the new norms for bank advances can, as in 1993-94, have a negative supply side impact on agriculture and small industries.

It is interesting to note that in spite of the cut in corporation tax, the government expects a 20 per cent increase in collections under this head during 1994-95. Presumably, the government expects a substantial improvement in the performance of the economy in general and that of the corporate sector in particular. This optimism is perhaps based on the expansionary effect budgetary measures are expected to have on private demand. The exemption limit for income tax has been raised; the average income tax rate is also reduced through adjustment in slabs; the minimum period of holding of units of UTI and Mutual Fund shares for calculation of long-term capital gains has been cut from 3 to 1 year; the exemption limit for gift tax has been raised from Rs 30,000 to Rs 1 lakh; and corporation tax rate has been reduced by 5 percentage points. No doubt, all these are expected to raise aggregate demand. But the tax concessions along with transfer through interest payments will, as in 1993-94, provide a further boost to the production of consumer durables and other items of luxury consumption. The only provision in the budget which will contribute directly to the demand for mass consumption goods is the Rs 2,000 crore increase in allotment for rural employment generation (provided there is no leakage from this source). Against this might be set the changeover to the system of *ad valorem* taxes, which, though justified on grounds of providing the much needed buoyancy to the tax system, will have the immediate effect of raising the prices of quite a few goods having large weights in the index of industrial production.

The Budget attests to the government's concern regarding negative growth of capital goods industries in 1993-94 and contains a series of measures to counter this trend. Here also the effect operating directly through government expenditure is far from expansionary. Government expenditure on capital account is in fact expected to go down by Rs 760 crore in nominal terms, or by about 8 5 per cent in real terms.[26] If we include investment expenditure expected to be incurred by public sector undertakings from internal and extra-budgetary sources the real growth in public sector investment will be near zero. This is of course on the assumption that expenditure on capital account of both the government and public sector enterprises does not (as happened in 1993-94) fall short of the target.

The boost to the domestic capital goods sector is sought to be provided through the following set of measures:

(i) cut in long-term capital gains tax on domestic companies from 40 to 30 per cent;
(ii) reduction in corporation tax rates by 5 percentage points;
(iii) extension of MODVAT to capital goods;
(iv) decrease in basic customs duty on project imports and general capital goods from 35 to 25 per cent;
(v) reduction in lending rates of banks and financial institutions by 1 percentage point;
(vi) scaling down of import duty on parts of capital goods to 25 per cent from the previous rates ranging from 25 per cent to 35 per cent; and
(vii) imposition of countervailing duty on imports of capital goods equivalent to the excise duty on domestic capital goods.

Measures (i) to (v) are intended to raise aggregate demand for investment, while (vi) and (vii) represent devices for preventing the diversion of this demand to imports even when there is no difference between the productivity of domestic and foreign capital goods.

Our analysis in Section III suggests that the provisions listed above are addressed to the periphery rather than the core of the problem of recession in capital goods industries. The correction of the anomalies in the tax structure via (vi) and (vii)—anomalies that run contrary to the standard principles of allocative efficiency—was of course long overdue.[27] But simply the prevention of substitution of foreign for domestic capital goods will be of little avail unless there is a significant increase in aggregate demand for investment. No major improvement on the demand front can be expected from the reduction in institutional lending rates by 1 percentage point, given the much lower cost of finance from other sources. Provisions relating to corporation tax and capital gains tax will help, as in 1993-94, more in generating bullish sentiments in the stock market than in effecting any significant improvement in the climate for investment. Under the package of policies presented in the Budget, growth in demand will primarily be in industries producing goods for upper class consumption and these goods are widely expected to be taken off the negative list of imports in the near future. Public investment in agriculture remains low. There is no move to assure private producers of the future availability of infrastructural services. In short, long-run policies reflected in the Budget cannot but make a rational producer extremely wary of undertaking investment on a large scale at the present juncture.

Long-Run Strategy

The upshot of our analysis is that in the absence of a sound strategy for long-run development of the economy, it will be difficult to avoid stagflationary tendencies in the system. The long-run policy under SAP is fairly clear and simple. There are also important elements in this policy which are eminently sensible and efficiency promoting However, the policy also has important gaps which need to be recognised and removed for realising the basic objectives of growth and poverty alleviation.

There are three major policy thrusts under SAP for which the government should be complimented. First, the attempt at simplification of the tax system and at removal of bureaucratic control and procedural hurdles producers had to face at various stages, cannot but have a salutary effect on the functioning of the economic system. Second, the clear signal given to managers of public sector enterprises that their job is to make profit and not to promote some non-quantifiable social objectives is essential for healthy growth of these enterprises. Third, the thrust on exports and cost-competitiveness of domestic industries is essential for long-run viability of balance of payments.

While the overall concern and policy on these three counts constitute a welcome departure from the *ad hoc* policies of the earlier decade, some of the steps taken by the government betray an inadequate understanding of some basic economic issues and often go against the implicit model behind SAP itself. We have already referred to the violation of allocative efficiency arising from the differential duties on capital goods and their components, and from the absence of countervailing duties on imports. While the 1994-95 Budget has removed some of these anomalies, others are permitted to persist (note 27). What is much more important, the government has not been quite consistent in following the principle of comparative advantage while promoting or discouraging industries

When consumer goods imports are banned, low customs duties on capital goods (and their components) cannot but have a distortionary effect on the allocation of resources between the two sectors. If the ban on consumer goods imports is intended to discourage consumption of some non-essentials,[28] the objective could be better served without violating the efficiency criterion by (a) imposing high excise duties on domestically produced luxury goods, and (b) allowing imports of these goods with countervailing duties If the objective is to raise the degree of capacity utilisation in consumer durables or other industries in view of the difference between market and shadow prices of imports [Rakshit 1986a, 1991, 1994], the ban should be supplemented by steps for discouraging investment in these industries Anyway, the argument applies equally well to capital goods industries. The differential degree of protection to consumer and capital goods industries can be justified only if the former are deemed to enjoy greater dynamic comparative advantage—a hypothesis that cannot apply to all consumer goods industries currently protected, and does not seem to have any solid foundation in empirical findings

The major flaws in the long-run strategy lie in two areas and there is no serious attempt in the Budget to correct these flaws We have repeatedly emphasised the importance of infrastructural investment and large-scale deployment of resources in selected industries in order to make them internationally competitive within a specified time frame This requires some indicative planning and close co-operation between the government and producers, public or private Second, the government does not seem to have any effective plan for raising agricultural investment and production—a lapse that augurs badly for the long-run internal and external balance of the economy

Removal of the two defects in government strategy requires, among other things, a significant step-up in public investment While the government is not perhaps unaware of this requirement, the stumbling block in this regard appears to consist in the problem of finance and the perception of the government concerning safe limits to fiscal and monetised deficits Elsewhere we have indicated why the concern of the government should be the revenue rather than the fiscal deficit, and how the

policy relating to interest rates, imports and public investment has led to the fiscal crisis in the Indian economy [Rakshit 1986a, 1991, 1994]. Unfortunately, the process of unlearning the orthodox tenets and of learning from experience appears extremely slow in official quarters and the economy has meanwhile to pay the price in the form of losses in jobs, income and consumption.

V
Conclusion

(a) Poor growth in agriculture and industry in the Indian economy has been accompanied by a substantial increase in the supply of finance, slow growth in bank advances, inflow of foreign funds, a jump in foreign exchange reserves, and a booming stock market.

(b) The key to the puzzles lies in (i) switch from a regime of credit rationing to a situation of excess supply in the loan market, (ii) interrelationship between demand constraint in the loan market, low investment and stagnation in agricultural output, (iii) differences in the factors operating in the share market and those affecting investment in fixed capital, and (iv) the way budgetary operations are related to (i), (ii) and (iii).

(c) Government policies under SAP have boosted the demand for consumer durable and contributed to the rise in share prices, but had an adverse effect on capital formation in both agriculture and industries.

(d) While measures aimed at simplification of the tax structure, removal of bureaucratic control, generation of profits of public sector undertakings, and export promotion should contribute toward efficiency and viability of the sytem, there are major flaws in tackling short-run problems and in the long-run strategy for development. The flaws consist primarily in the lack of any coherent policy relating to agricultural growth, infrastructural investment, promotion of activities in line with the principle of dynamic comparative advantage, and scale, composition and financing of government expenditure.

Notes

1 Ignoring the cash drain from the banking system that would have occurred with the concomitant rise in the level of economic activity.

2 For a more detailed exposition see Rakshit (1986, 1993).

3 Even when the central bank does not fix the structure of interest rates, strong oligopolistic elements in banking and finance tend to make the lending as also deposit rates fairly sticky. Neither does perfect competition by itself ensure market clearing interest rates since asymmetric information gives rise to the problems of adverse selection and moral hazard [Stiglitz and Weiss 1981].

4 There could no doubt be excess demand in some submarkets together with excess supply in others. Such coexistence does not invalidate the results relating to the overall working of the system.

5 Ignoring the feed-back from the commodity market associated with the use of credit.

6 Or rather, cannot be used for explaining the overall behaviour of the financial market.

7 Note that DC implies inadequate demand for loan by creditworthy borrowers. Apart from the fact that the imposition of norms can explain at best sectional but not overall demand constraint, there can be little doubt regarding the decline in demand for loans in real terms by creditworthy borrowers. Be that as it may, a boost in profitability in agriculture and industry would turn a considerable section of borrowers currently shunned by banks eminently creditworthy.

8 Most of which have found their way in investments on the asset side of the balance sheet of financial institutions including banks. However, the amount raised through Commercial Papers is fairly modest.

9 In a situation of demand constraint it is the minimum interest rate that matters.

10 The ratio was lower in the heydays of the period of scam.

11 To see the significance of administered interest rates in this context note that an increase in the supply of reserve money or non-bank credit will have no impact on aggregate borrowing for production and investment when all interest rates are fixed and the credit market is demand constrained.

12 The demand side factors are relevant more in explaining the composition of agricultural output than its total.

13 As distinct from overall credit rationing.

14 The whole of this does not constitute expenditure on final goods.

15 Strictly speaking, increase in emoluments of government servants should also be treated as transfers rather than public consumption, since they hardly raise the quality or quantity of public service.

16 During April-October 1993-94 the decline in sugar production was more than 55 per cent.

17 Since larger stockholding leads to higher prices in the open market. Note also that the increase in food subsidy was largely due to higher interest and other costs of maintaining large stocks, and hence did not benefit lower income groups, at least in the short run.

18 Through the Pigou effect, with share prices rising at a faster rate than the consumer price index.

19 Note that under the prevailing Exim policy there is no leakage by way of imports in respect of consumption goods (except through imports of their raw materials and components).

20 As we shall see, some of the anomalies are sought to be corrected in the Union Budget for 1994-95.

21 Most empirical studies suggest that an increase in dividends at the expense of retained profits tends to raise prices of shares.

22 This is partly borne out by the decline in share prices when the Union Budget for 1994-95 fell short of expectations.

23 We have elaborated elsewhere on the macroeconomic implications of such policies on fiscal deficit and public sector saving [Rakshit 1986a, 1991].

24 Central government expenditure as a ratio of GDP is more than 20 per cent.

25 The two targets appear to be inconsistent in that if expenditure is no more than the budget estimates, the revenue targets are unlikely to be attained.

26 Financial investment of the government largely reflects budgetary support for public sector investment.

27 However, there is still no import duty on fertiliser projects, duty on power projects is only 20 per cent, and imports on these two counts do not attract any countervailing duties. Again, there is no appreciation of the principle that even from the viewpoint of allocative efficiency, some subsidy is required for full utilisation of existing capacity in capital goods industries, though investment in these industries can be justified only on the basis of their long run viability [Rakshit 1986a, 1991].

28 This amounts to tacit admission of the failure of the direct tax machinery and government expenditure as means of promoting equitable distribution of income.

On Inflation and Subsidy

Ranjit Sau

Contrary to the finance minister's claim, stabilisation of the Indian economy was not completed last year by his own criterion and data, nor will it be in this year. Should structural reforms be pursued without first stabilising the economy?

The finance minister intends to revive the capital goods sector through a Keynesian deficit-induced multiplier-accelerator mechanism. But if the historical linkage between capital goods industries and the government's own expenditure on capital formation is any guide, then the drastic budget cut on the latter's account would frustrate his objectives.

Here we shall describe a new type of inflation, unheard of by the monetarists and the structuralists alike. This inflation springs from the wealth effect that emanates, unlike its Pigouvian cousin, from the stock market. The budget will dig this channel of inflation deeper.

There is a widespread misconception about subsidy and its magnitude. The well publicised estimate that puts total subsidies at 15 per cent of GDP relies on a wrong formula and a false notion.

The professed 'middle path' has degenerated in reality into a 'middle-class path' with an inclination towards the top-rich.

FISCAL deficit is the root cause of two evils, namely, inflation, and the balance-of-payments deficit. For stabilisation of an economy that has fallen into crisis fiscal deficit, therefore, must be brought down—in the case of India precisely to 4 per cent of GDP. This is the quintessence of the macro-economic theory and policy of our finance minister. And it has been enunciated on several occasions.

Last year while presenting the budget in parliament the finance minister declared that India had successfully completed the onerous task of economic stabilisation. But today the ex-post data, now available, indicate that his claim was premature. In 1993-94 the actual fiscal deficit at 7.3 per cent of GDP was way above the budgeted target of 4.7 per cent of GDP, let alone the 4 per cent benchmark that was stipulated for such deficit in the original memorandum signed with the International Monetary Fund (IMF).

This year the finance minister has said that the fiscal deficit for 1994-95 will be 6 per cent of GDP, which by itself is 50 per cent higher than the norm earlier set by himself. Besides, our simple arithmetic calculation with budget data shows a still higher figure, namely, 6.9 per cent, not 6 per cent, for that year.[1] Furthermore, we know, the realised number in such circumstances often overshoots a finance minister's projection. Reckoned by the finance minister's own criterion, stabilisation of the Indian economy, evidently, had not been attained last year, nor will it be in this year. If so, it raises serious questions about the strategy of liberalisation of the Indian economy.

"Some of the major liberalisation episodes during the last decade, such as those in Argentina, Chile, and Uruguay, took place in highly unstable macro-economic environments that eventually contributed to their failure. There is a growing belief that this macro-economic instability was not completely exogenous, but was in some sense related to the liberalisation strategies followed in these countries" [Edwards 1984: 3]. India, keeping in view its specificities, should carefully consider its options since the economy is not yet stabilised.

If fiscal deficit is the fountainhead of the dangerous twins, namely, inflation, and payments disequilibrium, what lies behind fiscal deficit? In other words, deficit 'ke pichhe kya hai'? Of course, the burden of subsidy, *inter alia*! Such is a widespread impression in India; it links subsidy, budget deficit, rapid price rise, and crisis in external account, in a chain of causation in that order. Some wrong notions and false measurements of subsidy have gained extensive publicity, and are misleading the public opinion. This essay is an attempt to set the record straight at an aggregative level.

Bad harvest, and printing of too much money by the government are part of the folklore on the causes of inflation. The finance minister, we believe, has dug another channel for inflation—it relates to financial speculations by the affluent. India had survived one securities scam two years ago. Another artificial boom in stock market—unrelated to economic fundamentals—is probably not far behind.

Section I gives some highlights of the budget. Section II deals with the above-mentioned new variety of inflation that springs from casino of the rich. Section III reviews some prevailing prejudices on subsidy. Section IV has a few brief remarks.

I
Budget Equations

Figures for 1993-94 are revised estimates (R E) and those for 1994-95 are budget estimates (B E). Let K denote capital expenditure by the government of India. From the budget papers of 1994-95 we find

(1) K(1994-95) = 0.977.K(1993-94).

It means that this year the government will cut down capital expenditure even in nominal terms, relative to the previous year. Just imagine what it means when corrected for inflation.

Capital expenditures are classified under two heads: plan, and non-plan, denoted by PK and NPK respectively. Indeed, K = PK + NPK. The budget shows

(2) PK(1994-95) = 0.941.PK(1993-94).

The axe has fallen heavily on plan capital expenditure. This is, I guess, for the first time in the history of planning in India since 1951 that capital expenditure on plan account has been slashed in absolute terms at current prices.

Non-plan capital expenditure will remain almost stagnant at current prices.

(3) NPK(1994-95) = 1.028 NPK(1993-94).

So it will fall in real terms if inflation takes place

The following two equations show the relative burden of interest charges in fiscal 1994-95.

(4) Interest payments = 1.013.(total plan expenditure).

(5) Interest payments = 0.507.(total non-plan revenue expenditure).

Obviously, interest payments are eating away an enormous amount of budgetary resources.

In the budget as such the amount of subsidies is smaller than that of interest charges. But the budget displays only explicit subsidies given to producers and consumers directly. Among them, subsidies on export, fertiliser, and food are known to be quite prominent. *The National Accounts*, however, follows a wider concept of subsidy that covers, in addition, losses incurred by departmental enterprises. Now, there is a third definition. In a very interesting paper Mundle and Rao (1991) have taken another step forward to include also services offered by government departments like health, education, housing, and family welfare. By this method it turns out that in sample year 1987-88 the estimated subsidy was as much as about 15 per cent of GDP, which is an astonishingly large magnitude.

FIGURE 1

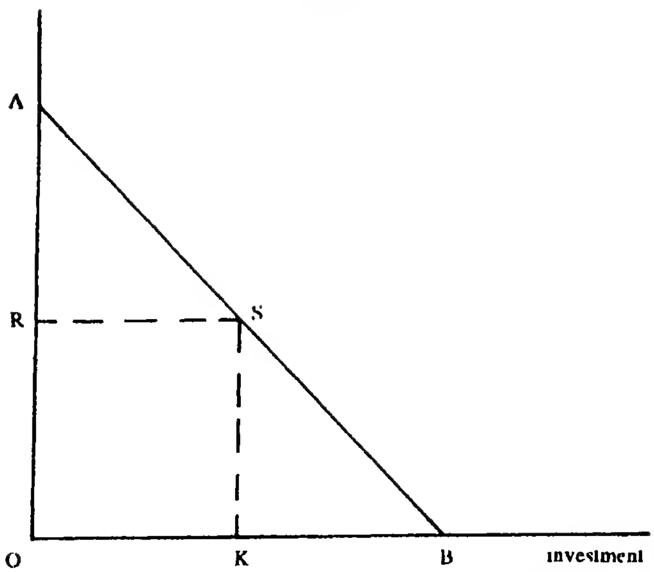

FIGURE 2

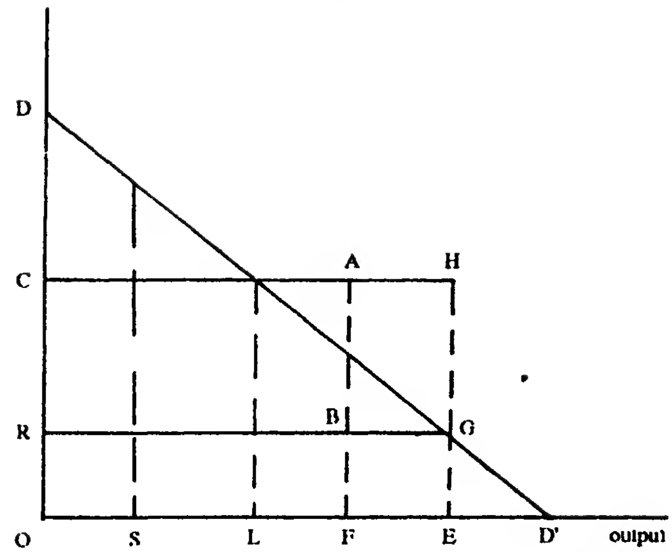


This round number of 15 per cent of GDP as subsidy has caught popular imagination Recently, in a television interview, the distinguished editor of a premier economics daily of India cited this figure to support his view that the government should curtail subsidies The print media is not lagging behind in this campaign either

As we shall elaborate below, the finance minister has taken a big risk in his latest budget. At the first signs of serious financial crisis the most likely place to chop expenditure—investment already having been sacrificed, see (1) above—is going to be subsidy, and that also will be probably done *ad hoc* After the Chelliah Committee on tax reform, India needs a committee on subsidy reform

II
Inflation by the Rich

The government has a sizeable hoarding of foodgrains at hand, procurement of wheat and rice this year has been above expectations Foreign exchange reserves are satisfactory. So the inflation potential of the budget is low For the government can easily resort to import, should there be any threat to price stability. This has been the official counter argument, in press conferences, against those who have linked the size of the budget deficit with the possibility of inflation.

In our judgment a primary source of inflationary pressure this time may come from an altogether unsuspected quarter, namely, the *wealth effect* arising from a stock market boom fuelled by funds released through corporate tax concessions granted in the budget, and inflow of foreign portfolio capital If poor men's wage goods do not do it, this time speculations by the 200-million-strong rising middle class and the top rich would ignite inflation

There are four reasons for the rush of foreign portfolio investment (FPI) into India's stock markets [2] First of all, the return on capital in India's industry is relatively high. Even in the most 'unstable' times, that is, fiscal 1991-92, it was not less than 16 2 per cent [ICICI 1993: 24]. In the preceding five years the rate of return had steadily improved. There was no set-back in industrial profit rate at all. The returns are generally higher in India's industry than abroad.

Second, the government has stated that interest rates will be gradually lowered. Given the inverse relationship between the prices of securities and interest rates, obviously the present owners of securities will reap capital gains as and when interest rates fall [3]

Third, it is a first principle of fund management that a portfolio should diversify into assets with uncorrelated returns. For the American, European, and East Asian investors India's equities are quite attractive on this ground.

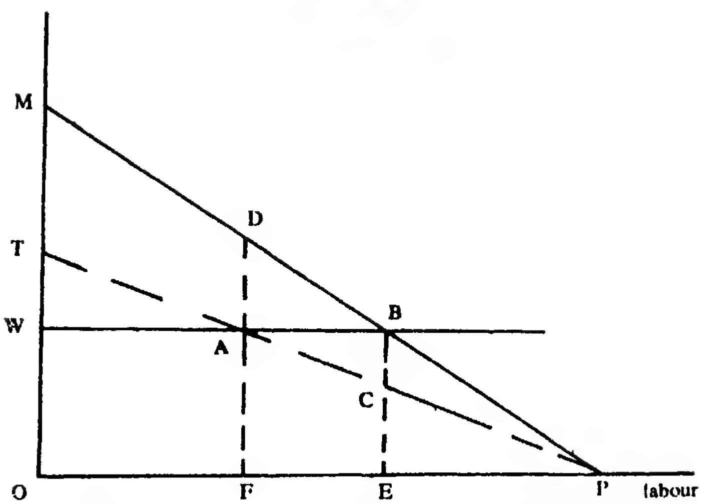
Fourth, tax rates in India discriminate strongly in favour of foreign investments here A large quantity of India's capital is said to have left the country, and is strategically parked abroad. This money can return with the garb of foreign currencies, and take advantage of tax concessions. Probably this is happening in fact.

The finance minister has proposed to phase out *ad hoc* treasury bills as a measure of restraint on money supply. But in an open economy—or in a half-open economy like India's—the total money supply is beyond the reach of a central bank. We suspect that a stock market boom will result from the inflow of FPI, and the tax relief granted to the corporate sector. This will create a good deal of paper-wealth, which in turn would raise consumption of the upper-middle class and the top rich This is going to be a new source of inflation. It may be recalled that the infamous 15-month-long stock market scam that ended in April 1992, was prompted by large-scale diversion of corporate money from the sphere of production to that of financial speculation.[4] It had no correlation with the level of industrial activity. Now, we see the same anomalous scene: rise in share prices, while a large section of industry, particularly, capital goods sector, is in a prolonged recession. Our corporate sector has demonstrated a profound fancy for speculation. Public sector enterprises have not lagged behind in this gamble.

In a press conference the finance minister has said that the fiscal deficit is meant for raising aggregate demand to help industry come out of recession. This sounds old-fashioned Keynesian, all right! But the trouble with this policy is that it is too far-fetched. We know that capital goods industries are in deep coma. Fiscal deficit, no doubt, generates purchasing power through the multiplier; but it directly benefits consumer goods industries. Only in the next round will the impact be felt by capital goods industries via the acceleration principle. Besides, there is another slip here. The budget has curtailed capital expenditure. It is precisely capital formation in the government sector that has traditionally induced capital goods industries. If this symbiosis is still valid then the multiplier-accelerator alone, in the absence of public sector investment programme, would not add up to much for the rescue of capital goods industries.

We shall now look at the problem from an altogether different angle. It is a standard practice to blame poor men's demand for wage goods as the trigger for inflation. Let us, for a change, consider the profligacy of the affluent in this context. Macro-economics has not yet been able to structurally

FIGURE 3



locate the stock market within its fold. Here we shall make an attempt in that direction, and thereby ascertain the impact of monetary expansion in the economy. Qualitatively, our conclusion will be fairly orthodox: an increase in money supply would raise aggregate demand taking into account wealth generated in the stock market. However, the impact would be far stronger than hitherto suspected—aggregate demand will be a *quadratic* function of the volume of money supply in our model.

In the short run, capital stock being fixed, the potential output at full-capacity, denoted by Y*, is constant. If and when aggregate demand exceeds Y* there will be inflation; and part of it might spill over into excess imports giving rise to payments difficulties. We turn to the formal model.

Let Y be aggregate demand, C consumption, I investment, and W wealth. We have

(6) $Y = C + I$

(7) $C = c.Y + h.W$, $\quad c,h > 0$

The marginal yield (net of wages and material costs) of investment is denoted by q. It is our hypothesis that

(8) $q = a - b.I$, $\quad a,b > 0$

At interest rate i, investment I satisfies the following.

(9) $q = i$.

From (8) and (9) we get

(10) $I = (a - i)/b$, $\quad a > i$

In Figure 1, curve AB represents (8). At interest rate OR investment is OK. Total gross profits from this investment is given by area OASK.

Following Keynes, in the short run firms finance their investment by borrowing from banks. So, at the end of the period, ORSK is paid to the banks as interest. The remaining part of gross profits is called net profit, N, which amounts to area ARS in Figure 1. In view of (8)-(10)

(11) $N = (a - i)^2/2b$.

This net profit, or dividend, is appropriated by shareholders through stock market. It is an institutional feature that a firm issues equities, each representing claim over the dividend on account of one unit of capital. So the total number of new shares floated in the current period is equal to investment I as of (10). For simplicity we shall ignore, in the following discussion, the equities related to the existing capital that were issued in the past. Let us note that the 'real' value of each share π, that is, the dividend, per share is given by

(12) $\pi = N/I = (a - i)/2$.

So there are I numbers of primary shares. However, as it happens in a modern stock exchange, a pyramid of derivative assets is built up on the foundation of these primary securities. In the process of speculation and derivative asset creation the total financial wealth generated in the stock market can be equivalent to a large multiple of the primary assets. Let Ø be the average paper-wealth so generated, per unit of investment. Now, in our perception the total assets[5] of consumer households consist of two parts: money M, and other financial wealth Ø.N.

(13) $W = M + \varnothing.N$

Let us remember we are ignoring, for simplicity, the stocks relating to the existing capital. We have observed that the availability of money facilitates speculation in stock exchange. So we stipulate the following.

(14) $\varnothing = v.M$, $\quad v > 0$

Finally, to make the model determinate we need a money demand equation. Let it be given by simply

(15) $M = m - n\,i$, $\quad m, n > 0$

From (6)-(15) we get

(16) $Y = [hM + (g+M)\{1 + hvm(g+M)/2n\}/nb]/s$

where $g = (an-m)$, and $s = (1-c)$. The direct impact of activities of stock market on Y passes on through parameters h and v. Evidently, in (16) money supply has a strong and positive influence upon aggregate demand: Y is a quadratic function of M.

So far we have implicitly assumed that goods prices are fixed. This assumption is acceptable so long as Y does not exceed potential output Y*. But beyond that point inflation is inevitable. Should the fiscal deficit and liberal invitation to FPI lead to a rise in money supply, inflation is quite likely through the above-mentioned channel. And it will upset many other calculations of the finance minister.

III
A Dubious Estimate

The budget this year has reduced fertiliser and food subsidies compared to the previous year. There is a common impression in the country that the government bears a heavy burden of subsidy, and that such expenditure ought to be slashed. We shall argue here that part of this apprehension may have arisen from wrong definition and false measurement of subsidy.

Let us look at the most comprehensive and oft-quoted figure on this subject. Consider a government department. Let the subsidy provided by this department to the people be defined as

(17) $s = v + (i + j).k - y$

where s is subsidy, v revenue expenditure, i interest rate, j depreciation rate, k the accumulated capital stock, and y revenue receipts. Here v is variable cost, and (i+j) k is fixed cost. Adding up over all the relevant departments concerned with social and community services, economic services, and general services in the government of India and the state governments the total subsidy is computed.

From the consolidated current accounts as of the table we find that for all the relevant departments together

(18) $v = A.1 + A.2 + A.3 =$ Rs 449.59 billion.

(19) $y = B.1 + B.2 + B.3 + B.4 =$ Rs 164.81 billion.

To proceed further we need the value of (i+j)k. With a sample of 417 public limited companies in the portfolio of the Industrial Credit and Investment Corporation of India (ICICI), it is found that depreciation and interest charges are equivalent to about 20 per cent of current expenditure. But these are all large-scale, capital-intensive companies; they consume substantial amount of raw materials that appear in their current expenditure. By contrast, government departments use comparatively small quantities of raw materials. So, relatively speaking, interest and depreciation charges may be higher for government departments when compared against their current expenditure. Let the former be equivalent to 30 per cent of the latter. In other words,

(20) $(i+j)k = 0.3.v$

In view of (18) and (20) we get

(21) $(i+j)k =$ Rs 134.87 billion

It follows from (17), (18), (19) and (21) that

(22) $s =$ Rs 419.65 billion.

Corresponding to the estimate of total subsidy s = Rs 420 billion as of (22), Mundle

and Rao [1991:1160] have arrived at a similar number: Rs 423 billion, which is 14.38 per cent of GDP in 1987-88. Their method is slightly different in minor details, but essentially much the same as the one outlined above. Specifically, they have computed the fixed cost on another basis.

The main problem with such estimate is that it ignores a major item, namely, B.5 of the table. Which department collects money from the people and under what pretext is a purely administrative matter for the government. For computation of the burden borne by the people the form is immaterial; the content is all important. Taxation and subsidy do have a bearing on resource allocation; but that is a separate concern. What is to be noted here is that it is absurd to conclude on the basis of such computation that the aggregate government subsidy to the people amounts to 15 per cent of GDP. Why should item B.5 be excluded from consideration? If the government services are valued as per current costs (ignoring fixed costs for the moment) then the total comes to Rs 935.31 billion as per item A in the table, against which we have to set off payments by the citizens to the tune of Rs 831.52 as per item B in the table. The 'subsidy' or the gap is only Rs 100 billion, which is one-fourth of the amount shown in (22). And it has a more familiar name—revenue deficit.

Fiscal prudence requires that revenue deficit should be avoided. There is no doubt about it. But the revenue deficit as such has no normative implication for determining either the optimal level of activity in a given department, or its pricing policy. To put it another way, the presence of revenue deficit in a department in a certain year does not necessarily mean that either the supply of service ought to be reduced, or the user charge raised. To pursue the matter, in Figure 2 let DD' be the demand curve for a service of a government department, OC the average variable and fixed cost, and OR the average revenue receipt. Presently, output is at OF. So, by (17) the subsidy is measured by RCAB. Does the occurrence of this subsidy justify either reduction in output, or rise in service charge?

First of all, note that the market is not in equilibrium. At price OR the quantity demanded is OE, and the corresponding subsidy would be RCHG. By the principle of social cost-benefit analysis a public sector project is advised to maximise consumer and producer surplus. Suppose q denotes the quantity of service, p its price, and the demand curve is given by

(23) $p = a - bq, \qquad a,b > 0$

The net social benefit U is measured by

(24) $U = \int (a-bq)\, dq - cq$

where c is the average (also marginal) cost. Maximisation of U with reference to q yields

(25) $q^* = (a-c)/b$

where the asterisk symbolises optimality.

If OC represents long-run average and marginal costs in Figure 2 then the optimal output is OL. Suppose the initial position is at S, which implies subsidy by formula (17). But that does not call for output reduction. Rather it shows that the supply of service should expand by SL. True, at L still there would be some subsidy as per (17). But that subsidy could be financed in several ways, of which raising service charge is only one alternative.

Furthermore, one can raise question about the significance or the existence of such demand curve. For a service like education or health-care, demand curve DD' has little meaning. Such services have externalities that are not recognised in (17). In a word, counting subsidies with a formula like (17) makes no sense.

Also, subsidies given by one department can increase government's tax revenue which will escape the attention of (17). In Figure 3 curve MP represents marginal product of labour in a competitive firm. We know direct and indirect taxes in India claim about 45 per cent of value added in industry [Sau 1992c: 1743]. At a given *ad valorem* tax rate (measured by ratio MT/MO) the firm perceives TP as the relevant labour productivity curve for its employment decision. At wage rate OW, it employs labour OF, whereas in the absence of the tax it would have gone up to OE. It is easy to show that both employment and total tax collection can be increased by a subsidy of ACB judiciously given to the firm at the margin. If the subsidy is disbursed through the industry ministry, and excise duty is realised by the finance ministry, only the former will be taken into account by formula (17), not the latter. The subsidy will appear in item A.2 of the table, and the additional tax revenue in item B.5; and thus the latter will go unnoticed by (17).

Finally, there is also an intertemporal aspect. Why should one carp on (as some short-sighted newspaper editorials are doing) the 'subsidy' given indirectly to students of, say, an Indian Institute of Technology (IIT), but forget about the taxes they pay later in their life?

IV
Concluding Remarks

So long we have heard so much about inflation originating in the agricultural sector, particularly with reference to the supply of foodgrains, or from budget deficit as such. The "New Economic Policy" having opened up fresh avenues of making quick moneys by the affluent middle class and the top-rich has paved the way for another channel of inflation. It comes through the wealth effect emanating from paper-wealth made in stock market, while industry languishes in stagnation.

The accusing finger for budget deficit and inflation is often pointed to the wrong direction having been misled by meaningless concepts and dubious calculations of subsidy. The government has failed to appreciate the positive role of subsidy for late industrialisation in the late 20th century.[6] The prime minister in his valedictory address at the World Economic Forum, Davos, Switzerland, in February 1994, had invoked for India the middle path as enunciated by the Buddha in the sixth century B C. The finance minister has perhaps interpreted it as a benediction for a middle class path, inclined to the top-rich. What else could be the rationale for his lowering of taxes on cosmetics while the budget displays disquieting revenue deficit?

TABLE: CONSOLIDATED REVENUE ACCOUNTS OF THE UNION AND STATE GOVERNMENTS, 1987-88

(*Rs billion*)

Departments	Union	State	Total
A Expenditure	481.29	454 02	935.31
A.1 Social and community services	20.89	179 85	200.74
A.2 Economic services	103.35	140.54	243.89
A.3 General services	0.06	4.90 (c)	4.96
A.4 Others	356.99 (a)	128.73 (d)	485.72
B Receipts	389.92	441.60	831.52
B 1 Interest, profits and dividends	63.49	19.85	83.34
B.2 General services	8.45	7.79	16 24
B 3 Social and community services	2.16	5.00	7.16
B.4 Economic services	21.94	35.23	57.17
B.5 Others	292.98 (b)	[illegible]3.73 (e)	666.71

Note: (a) Includes grants-in-aid to state and union territory governments, and Non-Developmental Expenditures under heads like Collection of Taxes and Duties, Audit, Interest Payments, Administrative Services, Defence Expenditure, Currency, Coinage and Mint, and Postal Services. (b) Includes Total Tax Revenue, Cash Grants from Foreign Countries and International Organisations, Aid Material and Equipment. (c) Includes Compensation and Assignments to Local Bodies and Panchayat Raj Institutions. (d) Includes all Non-Developmental Expenditures under heads like Organs of State, Fiscal Services, Interest Payments and Debt Service, Administrative Services, Pensions and Miscellaneous General Services. (e) Includes all Tax Revenue, and Grants from the Centre.

India's economic policy has been evidently informed by the International Monetary Fund (IMF) and the World Bank. The macro-economic Fund-Bank model, as formalised by Khan, Montiel and Haque [1990], assumes Say's Law. Being based on the monetary approach to the balance of payments, it has no investment function. Nor does it recognise the vital distinction between foreign direct investment (FDI), and foreign portfolio investment (FPI). Elsewhere [Sau 1992a, 1994b] we have seen that introduction of an investment function can overturn some key results of the IMF model. A continent-size federal economy like India's cannot be stabilised with financial programming of the IMF type.

Among all the developing countries of the world only three—Brazil, India, and South Korea—do have sizeable capital goods sectors of their own. Today, with empty order-books, the capital goods industries of India cannot find a trace of Say's Law anywhere. It wonders: where is the 'market' in this market economy? The Fund-Bank economics nowhere adequately treats the capital goods sector. Their trade theories are oblivious to such goods.

As narrated in the beginning of this essay the finance minister has virtually conceded that his strategy of stabilising the Indian economy has failed. Now the fate of the rest of his policy hangs in balance, on the performance of the capital goods sector. If this crucial sector, built over the decades with great care and enormous resources, does not respond vigorously within this year, the finance minister will then continue in his office (if he does) on borrowed time. He will be charged with throwing away the baby with the bathwater.

Notes

[This paper belongs to a research project 'subsidised' by the Centre for Management and Development Studies, Indian Institute of Management, Calcutta, without expecting any revenue receipt, and without any share in the responsibility for errors and views.]

1 According to *Economic Survey, 1993-94*, real GDP rose by 3.74 per cent, and the wholesale price index by 7.72 per cent, in 1993-94. In the previous year GDP stood at Rs 6,279 billion at current prices. Applying the above-mentioned two rates of increase, GDP at current prices in 1993-94 is estimated by us to be Rs 7,017 billion.

Suppose real GDP will grow at 5 per cent, and inflation rate will remain at 7.72 per cent. Then, in 1994-95 GDP at current prices will be Rs 7,937 billion. The budget estimate of fiscal deficit for 1994-95 is Rs 549 billion, which is 6.9 per cent of this estimated GDP. By comparison, the finance minister says that fiscal deficit will be 6 per cent of GDP. He is then assuming either a more-than-five per cent growth in real GDP, or more-than-7.72 per cent rise in price level, or both.

2 For the distinction between FDI and FPI, and their relationship with macro-economic stability see Sau [1994a].

3 A fall in interest rate reduces the relative price of a short-term bond compared with a long-term bond. Proof: Suppose a bond yields rupees R per year, and it matures in n years. At interest rate i its present value v is given by (ignoring the principal, for simplicity)

$v = R\,(r + r^2 + \dots + r^n)$

where $r = 1/(1+i)$. Consider another bond with the same annual yield, but maturing in (n+1) years. Similarly, its present value u is given by

$u = R\,(r + r^2 + \dots + r^{n+1})$

In a competitive market their prices will be equal to their respective present values. So the relative price of the former (shorter-term) bond in terms of the latter (longer-term) bond, denoted by w, is

$w = v/u = (1 - r^n)/(1 - r^{n+1})$.

Since $(1+r)^n$ is greater than $(1-nr)$ it can be shown that

$dw/di > 0$.

If a fall in interest rate is anticipated, a broker, therefore, will now buy longer-term bonds to sell them later. During the 1991-92 securities scam this theorem was cleverly used by brokers having insider information about movements of interest rate.

4 At its peak in April 1992, the sensitive index (Sensex) of Bombay Stock Exchange stood at 4,500, when the total capitalisation in stock markets of India was Rs 2,500 billion. In a sense therefore, each point of the index was associated with Rs 0.55 billion of market capitalisation. In 15 months ending in April 1992, the Sensex had gained 3,500 points, starting at a base of a little over 1,000 in early 1991. At the rate of Rs 0.55 billion per unit of the Sensex, the net addition to market capitalisation during this period works out at Rs 1,925 billion.

Let us say, roughly one-half of this addition, that is, about Rs 1,000 billion was due to rise in stock prices alone, the remaining part being attributed to enlistment of new shares and other factors. This estimate is purely tentative, and only indicative of the order of magnitude involved. As a comparative benchmark, we may cite that India's GNP in 1989-90 was about Rs 4,000 billion.

According to this crude but suggestive arithmetic, the stock price boom *per se* had created as if out of thin air a massive wealth of Rs 1,000 billion. The Janakiraman Committee, appointed by the Reserve Bank of India, detected cases of irregularities and fraud, and put the monetary size of the doubtful exposure of the banks and financial institutions at Rs 50 billion. Apparently, the average 'productivity' of the fraudulent money is 20 times its size. These figures highlighted two things: the enormous capacity of the stock exchange to create paper-wealth, and the significant role of money in this process. See Sau [1992b].

5 Household wealth consists of four components: money (15 per cent), bonds and equities (35 per cent), tangible assets (35 per cent), and life insurance and pension fund (15 per cent). The rounded figures in parentheses are indicative of the assets' shares in the total in the US during 1970 and 1988 [Dornbusch and Fischer 1990:123].

The Pigou effect is concerned with money alone, which is only 15 per cent of total household assets; it ignores bonds and stocks that account for 35 per cent. We include both in (13).

The initial version of this model was part of a larger framework developed in a paper that was presented in a seminar in Presidency College, Calcutta, in early 1989. While watching the amazing wealth-creating power of the stock market during the 1991-92 boom I was reminded of this model.

I thank Mihir Rakshit who prompted me to write that paper: but I must not blame him for the outcome.

6 Late industrialisation in the late 20th century in East Asia, for example, has three historic lessons for India. First, for a country having no edge in modern technology or product, late industrialisation has to rely on borrowed technology. To take full advantage of the relatively abundant labour supply, under the circumstances, the country must practise first-rate efficiency on the shopfloor. Second, in the preparatory stage the government must allocate, and monitor subsidies, and thereby get 'the prices wrong' so as to stimulate trade and investment. Third, domestic prices having been thus 'distorted' the export market would provide the standard, discipline, and reference point for efficient resource allocation. In short, subsidies have played historic role in late industrialisation in the late 20th century [Amsden 1989, 1991].

Economic Reforms and Macro-Economic Policy

Anup Sinha

The resurgence of conservative economic thinking in policy matters and the international pressures faced by the government in 1991 led to a thoroughgoing revision of macro-economic policies. However, the task of stabilisation has been far from successful. Even without implementing the really painful prescriptions, demand and business expectations have posed problems. Uncertainties and shrinking employment opportunities have compounded the difficulties. Structural adjustments, in terms of institution building, organisational changes and redefining the role of government, particularly in actively easing infrastructural bottlenecks and creating basic capabilities for the large number of the underprivileged (in whose name all the reforms are being undertaken) have been patchy and hesitant. A quick and substantial integration with the world economy has, however, been attempted and is bound to have transitional costs in agriculture and the capital goods sector.

SINCE 1991 there has been a conscious effort made by the government of India to change the focus of macro-economic policies, so as to make them consistent with the larger programme of economic reforms. In this context, the latest budget proposals presented by the finance minister came as something of a surprise to many. It was certainly not a 'hard' budget in terms of restoring fiscal discipline. Nor was it entirely a departure from the past three years. It does, however, reflect certain inconsistencies that have characterised macro-economic policy in India. Recent policies, and changes in the stance of the government, ought to be viewed from the perspective of international changes as well as the internal pressures emanating from powerful interests in the domestic economy. There are, of course, certain features of policy that we now take for granted. There is the usual gap between objectives and outcomes. There is the usual measure of arbitrariness, often motivated by purely political considerations, that keep people guessing as to when exactly promised policy changes will materialise. And of course, everything is done in the name of removing poverty and deprivation.

In this paper some of the compulsions driving state policy are discussed in Section I. Section II traces the major features of macro-economic policy during the past three years. Section III contains a discussion of trends in the economy and the budget proposals for 1994-95. Section IV analyses the prospects for the economy during the coming year. Section V provides some concluding observations.

I

In the Indian economy, public control and planning have always played a crucial role in defining the limits of market-based activities. The current phase of economic reforms seeks to alter the division of labour, so to say, between the market and the state. The compulsion to undertake these changes was largely due to the pressures of the IMF and the World Bank. It was also, however, determined by the pressures from a growing and articulate middle class with growing international ties. The genuine dissatisfaction generated by years of arbitrary government intervention, and low productivity levels and inefficiencies of various kinds created a receptive climate for change. The economic crisis of 1991, and the fact that a new government had come to power, also made such experimentation with change easy.

Economic policy in India had in the past been influenced by the dominant Keynesian thinking regarding the practice of monetary and fiscal policy. On the other hand, the influence of Soviet-type planning had influenced policies designed to address the problems of supply, capacity creation, and growth. The rapid collapse of the Soviet Union and East Europe, along with a growing dissatisfaction with the Keynesian consensus in macro-economic policy-making in America and Europe, made market-friendly reforms and a non-interventionist macro policy-regime attractive as a viable alternative.

Keynesian policies along with state planning were at the heart of what is now referred to as the Nehru-Mahalanobis consensus. This consensus came to represent the hegemonic system in India. For sure, it was a weak hegemony of capital, as other contending social classes and groups had significant strengths in influencing state actions. According to Gramsci, a hegemonic system is a social equilibrium based on coercion and consent. The coercion is not always explicit. Exploitation takes place with the consent of the exploited in the sense that there may not exist a perceived superior material alternative. The compromises and sacrifices made by the contending classes are made on the basis of the 'decisive function' of the leading group in the decisive nucleus of economic activity. In short, the Nehru-Mahalanobis consensus was essentially geared to the development of capital. To quote Gramsci:

> It is true that the state is seen as the organ of one particular group, destined to create favourable conditions for the latter's maximum expansion. But the development and function of the particular group are conceived of, and presented, as being the motor force of a universal expansion, of a development of all the 'national' energies. In other words, the dominant group is co-ordinated concretely with the general interests of the subordinate groups, and the life of the state is conceived of as a continuous process of formation and superseding of unstable equilibria (in the juridical plane) between the interests of the fundamental group and those of the subordinate groups—equilibria in which the interests of the dominant group prevail, but only up to a certain point, ie, stopping short of narrowly corporate economic interests [Gramsci 1980: 182].

In such a situation, democratic political institutions allow claims to allocation of resources and distribution of output, consented to by the capitalists. In short, there is democratic control over the level of employment and the distribution of income. Keynesianism provided a theory for the determination of income and the evaluation of alternative policies. Keynesian policies promised full employment with equality, without sacrificing profits and private ownership. Keynes himself had remarked:

> I conceive, therefore, that a somewhat comprehensive socialisation will prove the only means of securing an approximation to full employment, though this need not exclude all manner of compromises and of devices by which public authority will co-operate with private initiative. ... It is not the ownership of the means of production which it is important for the State to assume. If the State is able to determine the aggregate amount of resources devoted to augmenting the instruments, and the basic rate of reward to those who own them, it will have accomplished all that is necessary [Keynes 1942: 378]

In recent years, the twin phenomena of rising inflation and slower growth has proved remarkably unresponsive to Keynesian interventions. In India, the social consensus became dependent on concessions granted to groups organised as non-market players. The allocation of resources became increas-

ingly determined by political bargaining and processes. The problems of Keynesian demand management lay not merely in an inability to predict a complex future, not only in terms of rising lags in policy effects, nor in terms of supply side shocks being unamenable to demand management, but above all in the inability to sustain high rates of growth. The problems of inflation, rising global interdependence, and political allocation of resources pose trade-offs that can be hostile to demand management alone. Moreover, in a country like India, where the shortage of capital in certain key sectors is a binding constraint, demand stimulation alone may, in fact, accentuate the problem of unsatisfactory growth rates, unless there is a careful co-ordination in supply side management.

Throughout the advanced capitalist countries, the policy response to this trend has been a right-wing restatement of the anti-statist orthodoxy of the 1920s, albeit embellished with well developed theoretical devices of new classical macro-economics and monetarism. The essence of this is the conventional wisdom of the 20s, centred around balanced budgets and deflationary policies. In this line of thinking, higher investments require higher savings, which in turn, need higher profits. Therefore, a redistribution in favour of profit earners is desirable from the viewpoint of economic growth. Profits are seen as the motor of accumulation. Rising wages, welfare spending, transfers and subsidies are hindrances. Similarly, any government intervention that restricts profits and profitability should be done away with, even if such restrictions reflect negative externalities and social costs. The promise of higher investment, higher productivity and faster growth entails lower taxation, lower non-military public spending, reduced regulations on profits and a dilution of workers' bargaining strength.

While the problem of supply side constraints needs to be faced squarely, it does not follow that investments are low because profits are low. Similarly, government investments may be bad and wasteful, but the entire waste cannot be located in non-military public spending programmes alone. Investment in an efficient bomber may be more wasteful than investment in an inefficient public transport system. More incentives and more income to those who save more may be necessary, but certainly not sufficient, for rapid investment and growth. This has been amply borne out in terms of what has happened in our economy over the past one year.

The background of economic reforms was this mix of global demonstration effect and a brewing internal pressure to reorient economic policy towards markets and private incentives.

II

Economic policy reforms consist of two distinct strands, stabilisation and structural adjustments, based on prescriptions from the IMF and the World Bank. India began both these programmes in 1991. Stabilisation deals with demand management while structural adjustment deals with sectoral policies designed to address problems of the supply side in the economy. Structural adjustment entails major policy shifts to allow markets to determine prices, and reflect scarcity values even when prices are controlled. This means allowing markets the freedom to allocate resources and getting prices 'right'. It also entails a shift of resources from government control to private hands, in short, privatisation. These changes in turn imply that the government must re-define its role in the development process and carry out institutional and factor market reforms consistent with its new role. Simultaneously, trade liberalisation would mean a systematic shift of resources from the non-traded to the traded goods sectors. These reforms are expected to take time, careful sequencing in terms of timing and magnitude of change, depending on the country's level of political tolerance for rapid change, and the perceived level of transitional costs of adjustment.

To facilitate such changes and build a climate of macro-economic stability, the programme of stabilisation is carried out as a precondition. Stabilisation seeks to use macro-economic fiscal and monetary policies to deflate demand so as to reduce the gap between aggregate demand and short-run aggregate supply. Typically, it addresses three problems. First, to bring inflation under control through a restrictive monetary policy. This is usually brought about by hikes in the interest rates to reduce investment demand and increase savings. In tandem with this, there is the prescription to shift government deficit finance from the banking system to private bondholders to enable stricter control of money supply. Second, to correct deficits in balance of payments, usually through devaluation of the exchange rate (in a fixed exchange rate regime) accompanied by import liberalisation and a transition to floating exchange rates. Third, to check fiscal deficits by curbing government expenditures, particularly subsidies and other non-essential spending. Fiscal deficit correction would also require increases in the price of government-supplied goods, like food and infrastructure services, for increased revenue. Higher tax earnings through tax reforms are also part of the agenda. The government of India had undertaken all these steps since 1991.

The central issue is controlling inflation. For instance, the price of exportables relative to other goods, the price of labour relative to other factor prices, and the real rate of interest, are all affected by inflation and expectations about future inflation rates. If the inflation rate is constant and perfectly predictable, there is of course no problem. However, in most developing countries there are distortions in relative prices emanating from the balance of bargaining strengths of organised groups like big industrialists, trade unions, civil servants and the military, and landlords. This constant shifting of the balance of forces leads to a volatility in relative prices. For instance, low and fluctuating real interest rates might induce lenders to prefer short-term investments, reducing the supply of long-term investible funds. There will also be a tendency for holding foreign currency portfolios, or investing in assets like land and gold, which are expected to yield capital gains. This is the crux of the IMF-sponsored stabilisation package.

The experience of deflationary stabilisation has been far from the ideal stipulations of the IMF. All the policy measures that form the package do reduce expenditure and demand, but invariably affect the supply side or short-run income and output of the economy in the following fashion: devaluation, through raising costs of imported raw materials and intermediate goods, fiscal deficit reduction, through cuts in developmental spending and infrastructure, and credit squeeze, by affecting the cost and availability of working capital in situations where a large proportion of output is credit constrained. They all affect the supply side in a negative manner. If the government cannot (or fails to) exert control over these effects, the gap between aggregate demand and aggregate supply can widen further, leading to stagflation. This is because aggregate demand may fall, but aggregate supply may fall even more, thereby widening the gap to result in inflation accompanied by recession. The typical international experience has been negative rates of growth and doubling of the rate of inflation in the first one or two years of stabilisation.

The literature on stabilisation experiences and problems is large. Apart from the problems of sequencing, timing, credibility, and changes in income distribution, there is a more fundamental problem regarding the monetary roots of inflation as envisaged in the IMF package. Taylor (1983 and 1988), Rakshit (1986) and others have argued that a significant group of economic agents, namely, workers and industrial firms set wages and prices by specific rules like wage-indexation and mark-up pricing. These rules prevent

conflict between different groups in maintaining income shares under changing conditions In such a scenario, a monetary contraction, relative to the rate of inflation, can result in reduced output and employment if profit margins are to be preserved In a developing economy, if the availability of food is supply constrained then flexible food prices are usually the chief determinants of changes in the rate of inflation Empirical evidence on the Indian economy [Balakrishnan 1991] seems to question the monetary roots of inflation in India Most economies have a mix of fixed and flexible prices Therefore, macro-economic policy reforms must be designed for the specifics of each country

The performance of the Indian stabilisation programme appears to have been satisfactory if we only look at GDP growth rates and changes in the rate of inflation Compared to the past we have done worse However, compared to the experiences of Latin America and East Europe, we have done better Growth rates have not declined to negative levels, and inflation rates have certainly not doubled compared to the recent past (though it did go up significantly in the first year of stabilisation) It is still hovering around 10 per cent, which is probably the politically tolerable limit Expectations regarding inflation rates, however, indicate that inflation is far from stable, with anticipations of higher rates in the future

In terms of policy targets, however, none of the announcements made by the government have been realised GDP growth rates have been lower than anticipated, inflation rates higher Fiscal deficits have never been exactly on target in the past three budgets, with all indications this year that it might climb to alarmingly high levels Monetary expansion (M3) has been higher than target levels in all the three years The balance of trade has shown signs of improvement but there are many other factors responsible for it Indeed, it might be argued that the government has not really gone through the true-blue stabilisation programme according to IMF prescriptions Had it done so, the contraction of the economy might have been much more severe However, the climate is far from stable There are mixed expectations about the speed of reforms pending on the government's agenda Inflationary expectations and anxieties about infrastructural bottlenecks stemming from a virtual stagnation in government spending on the capital account cannot be a very conducive environment for a major investment spurt Employment has stagnated Government spending on revenue account has risen sharply, and by all indications, appears out of control If stability, both in terms of crucial macro-economic variables and the policy programme, then it has failed so far Yet, according to proponents of the programme, stabilisation is supposed to yield results in three to four years' time

III

This year's budget, which was expected to be a firm consolidation of the stabilisation package, yielded surprises The *Economic Survey* along with the budget proposals, reveal some disturbing features of the economy that can have adverse long-term consequences

The performance of the economy during the past year has been significantly below expectations The rate of growth of GDP is estimated to be 3 8 per cent as against the projection of 5 per cent Inflation has averaged around 8 per cent as against the projection of 5-6 per cent M3 has been growing at a rate slightly higher than 14 per cent as against a projection of 12 per cent The fiscal deficit is going to be well over 7 per cent of GDP against a projection of 4 7 per cent Agricultural production as a whole, as well as foodgrains production separately, is estimated to have declined The growth rates being -0 9 per cent and -0 5 per cent respectively Industrial production is estimated to have grown by a meagre 1 6 per cent with a sharp decline in capital goods production and the production of consumer non-durables Imports have stagnated in dollar terms Exports, however, have grown by about 20 per cent in dollar terms Tax revenues have been well below budgeted figures and spending, particularly on the revenue account, has gone up Subsidies have increased The budgeted deficit has doubled from Rs 4,314 crore to a revised estimate of Rs 9 060 crore The primary deficit which was budgeted to be a negative Rs 1 041 crore is revised to be Rs 21,051 crore By all measures there has been a slowdown of economic activity, even without the really hard prescriptions of stabilisation

As far as government spending is concerned, all the politically soft options have been chosen Despite increases in the issue price of foodgrains and other administered prices, the revenue side of the government budget seems gloomy Tax collections have been poor Direct tax collections have been on target, though there has been no perceptible effort in base-broadening Indirect taxes, customs duties and central excise targets have gone awry This is despite significant reduction in rates and simplification of procedures and exemptions There are two reasons for this First, it can be an object lesson for the government that reductions in rates alone do not lead to better compliance Secondly, the level of economic activity that was anticipated in computing tax earnings was belied Removing restrictions on higher levels of investment and output Large corporate houses have had healthy looking bottom lines in their profit and loss accounts That did not, however, get translated into more activity

The government does not appear to have learnt its lesson on this count This year's estimated earnings are at higher levels with optimistic predictions about growth Tax simplifications and rate reductions have been carried further as promised On the indirect tax front this is desirable, if compliance and collection is to be streamlined However, direct taxes, particularly personal income taxes have continued to be the instrument for pacifying the demands of the articulate upper middle class and the rich The contribution of direct taxes continue to be paltry, with a very large segment of incomes in agriculture, the unorganised sector and the middle segment of the organised sector left untapped The poor response to the presumptive tax scheme for small business shows the lack of credibility of government announcements Thus on the tax front the total budget estimate for gross tax revenue of Rs 87 136 crore is likely to be an overestimate Both the measures of elasticity and buoyancy have been hiked up based on the assumptions of better tax collections and higher growth rates which are unrealistic

The expenditure side is probably an underestimate, as usual While revenue expenditures have gone up capital expenditure has completely stagnated in real terms Total capital expenditure has fallen from last year's revised estimate of Rs 33,648 crore to a budgeted amount for this year at Rs 32,888 crore Plan expenditures on revenue and capital accounts have stagnated from a revised estimate of Rs 46,026 crore to a budgeted amount of Rs 46 582 crore As far as non plan expenditures are concerned, they have been increased by Rs 7 271 crore of which interest payment alone has risen by Rs 8 500 crore Social services spending in the revenue account has been cut when compared to this year's revised estimates The Central Plan outlay has also stagnated in real terms Moreover the resources have been spread thinly over the sectors The biggest gainer has been rural development, though there is a cut in spending on irrigation and flood control As far as rural development is concerned, the bulk of resources will go for employment generation There has been massive pumping of funds on this account However statistics in the *Economic Survey* reveal that last year none of the targets for employment generation were fulfilled In other words there is reason to believe that an enormous amount of monetary resources are wasted The overall expenditure pattern reveals that there is neither a concerted effort to reduce wasteful expenditures nor to cut subsidies and defi-

cuts as prescribed by the IMF. On the other hand, there is no indication that the government is making concentrated efforts to ease constraints on the infrastructure front, or build basic capabilities in terms of food security, basic health and education. The logic of budgetary allocations has been 'politics as usual'.

IV

This year's budget has been described as a gamble on growth. Tax cuts and deficit spending has been considered the Keynesian prescription for boosting a recovery. This is supposed to have a multiplier effect on output via a rise in effective demand. Before analysing the likely impact of the budget on demand and output, it may be noted that the entire idea of stabilisation and structural adjustments relies on reducing the necessity of government managed budgetary policies for influencing output and prices during recessions and booms. If this budget reflects a conscious decision to rely on Keynesian prescriptions for macro management, then it tacitly admits that the economic logic underlying the reform programme is not working according to expectations.

Coming back to the issue of the budgetary impact on effective demand, it may be argued that tax-cuts have to be translated into higher disposable income via larger take-home pay packets, higher distribution of corporate profits in the form of dividends and lower prices for the consumers via indirect tax cuts passed on to them by producers. Corporate dividend earners and income tax payers form a very small group in terms of the total population of the country. However, their purchasing power is quite large. Any rise in their demand is likely to be for consumer durables and services. Last year, indirect tax cuts have not been significantly passed on to consumers according to the finance minister's own admission. Therefore, there is no reason to believe that this will be so this year. On top of it, the streamlining of excise duties and moving to *ad valorem* rates may imply higher prices for the consumer for a number of products. Given the fact that this year is the second year of tax cuts, and judging by the performance of consumer non durables last year there is again no a priori reason to believe that consumer goods in general will experience a spurt in demand.

Even if we argue that a consumption-led growth path is being envisaged, the capital goods sector is not quite out of trouble. Starved of demand, and facing a growing threat of competition from direct investments and imports, its performance has been dismal in the past year. The extension of MODVAT for capital goods and the countervailing duty on imports appears to be good news. There are two problems that must be considered, however, before any conjecture can be made about the fate of this sector. First, import duties have been cut, and it remains to be seen whether domestic capital goods can indeed compete with external supplies, including project imports and imports of used machinery.

The capital goods sector, to experience any turnaround with or without foreign competition, requires at the minimum, a rise in domestic demand for capital goods. Private investment has remained sluggish throughout last year, even though many pre conditions were observed like an active consumer durables market, an active primary issues market and better corporate profits. All these did not result in growth. Foreign direct investment has been slow in actually entering the economy being a flow of $ 500 million annually against a target of over $ 2 billion. Real interest rates are still too high for the medium and small investors to borrow. Financial institutional lending to the private sector has been more or less constant over the past two years. If indeed infrastructure is the problem constraining long term investment, the government's capital account expenditures do not reflect any awareness of this issue. Over and above this, rising market borrowings at attractive rates of return, compared with the past, can actually crowd out private investment. Finally, a lesson from international experience has been that, where the government and the public sector had played the lead role in investment expenditures, the private sector takes a long time to become dynamic when the roles are reversed. Thus, on all counts growth and investment may be largely elusive this year too.

As far as the budgetary impact on inflation is concerned, it is difficult to make any strong prediction. A lower budget deficit even if this can be achieved, may not be an important determinant of changes in the rate of inflation. Food production levels are more important on this count. While food production has been lower than before, the buffer stock of foodgrains is adequate for the time being. Exchange rate changes can have an effect though, by affecting the cost of production, and hence influencing inflation rates.

The foreign trade sector shows a robustness that may be short lived for a couple of reasons. First, export growth is unlikely to be sustainable at the current rate in the intermediate run, particularly when domestic capacity creation may be constrained by infrastructural bottlenecks. Secondly, the RBI may not continue to hold the exchange rate, particularly if exports do not perform as well as this year. This may trigger off a possible depreciation, and a flight of FII 'hot money', leaving foreign exchange reserves in shambles. Import costs will increase, affecting domestic costs of production.

Overall, the economy is set to trudge along at a growth rate of three to four per cent, with inflation crossing the politically tolerable limit of 10 per cent. Hesitancy in industrial recovery coupled with stagnant employment opportunities can create political pressures to dole out further government support, thereby straining the deficit as well as putting pressures on the rate of inflation. Agricultural prices and the output mix is set for fundamental changes due to rising exports from this sector. A rise in prices will further fuel inflation.

In the recent past the budget presentation has been used by the finance minister to make important announcements regarding sectoral reforms. This year a commitment has been made to make progress on the financial sector and banking reforms. However, there has been a silence on labour market reforms and public sector reforms. The first issue might affect business expectations about the economic climate in factor markets adversely, as industry has been clamouring to make labour markets more competitive to allow wage flexibility. The latter issue, regarding privatisation, may restrict any dynamism on the part of public sector decision makers, as they will be left guessing as to what exactly is going to be the ownership structure and its implications for their own autonomy.

V

The resurgence of conservative economic thinking in policy matters and the international pressures faced by the government in 1991 led to a thoroughgoing revision in macro economic policies. Economic policy changes, compared to the regime of the past, have been significant. However, the task of stabilisation has been far from successful. Even without implementing the really painful prescriptions, demand and business expectations have posed problems. Uncertainties and shrinking employment opportunities have compounded the difficulties. Structural adjustments in terms of institution building organisational changes, and redefining the role of government, particularly in actively easing infrastructural bottlenecks and creating basic capabilities for the large number of underprivileged (in whose name all reforms are being undertaken), have been patchy and hesitant. A quick and substantial integration with the world economy has, however, been attempted. This is bound to have transitional costs in agriculture and the capital goods sector.

The experiment with new policies has not resulted in the exercise of 'hard' options. Neither has it resulted in a fundamental transformation of the role of government. Even going by the IMF and World Bank set of prescriptions, reforms entail heavy social costs, the incidence of which falls on

unorganised workers and the poor, as well as on a number of privileged groups that constitute the ruling elite The rich who enjoy the maximum benefits of subsidies the politicians who strike lucrative deals with business and the smaller business persons who have control over niche markets are likely to resist rapid change

As it was with decades of planning and democratic socialism so also now limited market friendly reforms are for the rich and privileged A small enclave of big industry and wealthy consumers stands to gain The process may not be sustainable in the long run Low growth and stagnation might cause a reversal Alternatively even if growth rates do pick up along a consumption led path, it may turn out to be unsustainable in a situation where the distribution of the benefits of growth results in what Dreze and Sen (1989) refer to as unaimed opulence

The current spate of policy reforms does indicate a growing strength of Indian industrial capital to the extent it desires to free itself from the arena of state controls But there are limits to this freedom that they themselves might want or can achieve The legitimacy of a new social consensus has to rest on curbing the privileges of the rich emanating from state interventions [Bardhan 1992] and building a new set of alliances with the poor None of these changes are discernible Yet a strong hegemonic system requires political legitimacy if it is to avoid unnecessary dependence on coercion The success of reforms cannot be a matter of faith Optimism is certainly laudable But unless tempered with a good dose of realism and political will it can be unnecessarily transient and fragile

Growth Prospects Recede as Macro-Economic Situation Slips Out of Control

Arun Kumar

The economy is in a vicious trap of deteriorating macro scenario resulting from the operation of the new economic policies. The dictates of globalisation have required lowering of customs duties and reduced public investments. Both of these have meant a narrowing of the home market and dependence on the private sector to promote growth. This has required incentives to capital through tax cuts which have led to larger budgetary deficits and lower public investments. These and other policies have shifted the distribution of national income in favour of the propertied and further narrowed the home market and reduced the prospects for growth.

The new economic policies have not induced the expected supply side responses due to lack of demand in spite of the rise in budgetary deficits but have resulted in cost-push inflation. This has simultaneously caused the fiscal crisis and slowed down growth. With one-time adjustments mostly exhausted and elections round the corner, the fiscal situation can only worsen and the manner in which this will happen will prevent growth from reviving. The resort to fudges to dress up the new economic policies is proving a one-way street to fiscal and economic crisis.

THE union budget for 1994-95 needs to be assessed in the light of the performance of the economy in 1993-94 and the likely prospects (including problems) for the economy in 1994-95. In 1993-94, the economic performance except for a few bright spots was largely indifferent [Kumar 1994b]. The overall rate of growth of the economy declined and agricultural output is set to decline. The industrial sector could not break out of the low growth trap. The rate of inflation hovered around 10 per cent in spite of the sixth good/average monsoon in a row since 1988. Unemployment continued to be a cause of concern with a decline in public sector employment. Retrenchment of labour has started under VRS and golden handshake. The organised private sector is also laying off (since its capital formation and growth rate remain low). The budgetary situation deteriorated with the steep rise in the revenue and budget deficits.

The external sector was the bright spot of economic performance in 1993-94. Exports rose through the year at about 21 per cent. Imports did not rise over last year's level so that the current account deficit has come down sharply from $ 5 billion to $ 0.5 billion. Foreign exchange reserves have risen sharply to about $ 14 billion. Foreign direct investment and portfolio investment have gone up substantially. On the home front, the sharp rise in foodgrain reserves is a positive aspect.

The 1994-95 budget was expected to use the reserves of foodgrains and foreign exchange to help step up the rate of growth of the economy in a non-inflationary manner. It was also expected that the rising budgetary imbalances would be brought under control. The sharp rise in the budgetary deficits and the rate of inflation in spite of the string of six good or average harvests implied that the economy was in need of stabilisation. For this, the implementation of those elements of the Structural Adjustment Programme which could further destabilise the economy needed to be postponed. Some of these could be listed as cutting tax rates, opening the economy further and incurring expenditures on VRS [Kumar 1994b].

The 1994-95 union budget has belied most of these expectations. Even the proponents of NEP have expressed consternation at the sharp deterioration in the fiscal situation. Even the finance minister does not know how to justify the situation and has spoken in two voices. He has said "I am not happy with this fiscal deficit level" and "a sharp reduction in fiscal deficit by cutting current expenditure would have been counterproductive" (FM's interview in *The Economic Times*, March 11, 1994). The finance minister has further expressed hope that supply side responses will take place due to tax cuts and liberalised imports even though these have not occurred in the last three years.

To understand these confusions, one needs to analyse the emerging macro scenario. This has been attempted in this paper. Section I presents the overall theme of the union budget for 1994-95. Key features of the budget, the external sector in Section II and the tax reforms in Section III, are commented on. Section IV and V analyse the possibilities of supply side response and price rise following the budget. Section VI and VII look into the likely impact of budgetary deficits on demand and the reasons for their sudden rise since 1993-94. Section VIII analyses the likely impact of the union budget for 1994-95 on the economy in the light of the macro analysis in the earlier sections. Section IX presents the likely scenario as it may unfold in the future. Conclusions are given in Section X.

I
Guiding Spirit

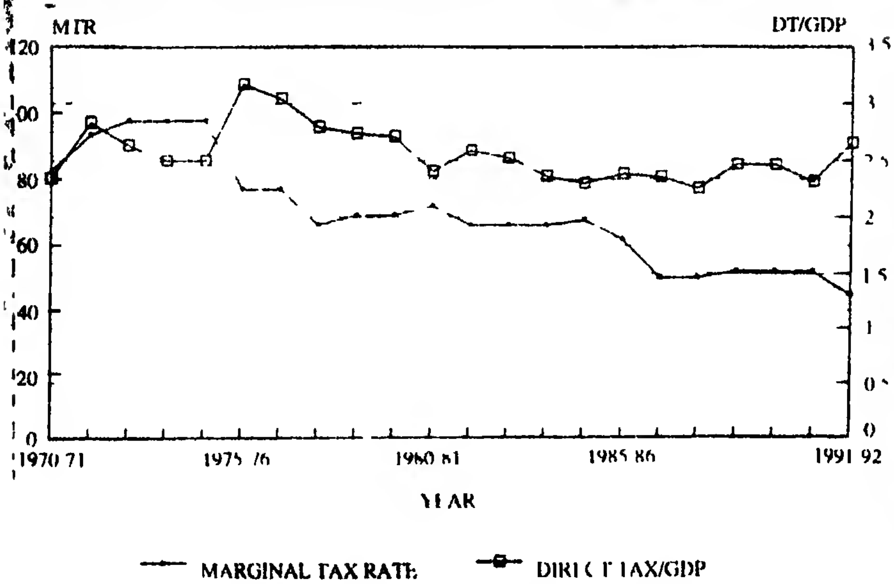
Since 1991, budgets were being framed in the context of the New Economic Policies (NEP) consisting of the Stabilisation Policies and the Structural Adjustment Policies (SAP). The priority was to stabilise the economy even if in a regressive and deflationary manner. As a part of SAP, the economy was being globalised—opened up to foreign goods and capital.

In 1994-95, customs duties and direct tax rates have been cut in spite of low revenue buoyancy, rising expenditures and rising revenue and budget deficits. In spite of the lack of stabilisation this represents, current account convertibility has been introduced and this will further destabilise the economy. Hence not in the national interest. This is being ignored since the philosophy guiding the union budget for 1994-95 seems to be the opening up of the economy. Even here, policies that should have accompanied it to protect the national interest are nowhere in sight. The imprint of the new GATT agreement is also clear.

Many aspects of the union budget can be commended, like the rationalisation of the indirect tax structure and the extension of MODVAT to cover more commodities so as to move towards a full VAT. There is also the attempt to broaden the tax base by bringing services into the indirect tax net and by extending presumptive taxation [GOI 1992] to certain class of incomes. All this represents a reform of the taxation structure and could be welcomed[1] but for the overall macro implications of what has been done which overwhelms the welcome features of the budget.

To put a gloss over a deteriorating fiscal situation, the government is justifying the 1994-95 budget on grounds of its growth orientation. It has been argued that large stocks of food and foreign exchange reserves will not let the level of inflation rise. It has been stated that the budget is designed to induce supply side responses to accelerate economic growth. Each of these arguments needs to be analysed.

GRAPH 1: ESTIMATES OF MARGINAL TAX RATE, AND RATIO OF DIRECT TAX TO GDP



II
External Sector

This sector is the bright spot in the economy and is also the one governing the key aspects of the 1994-95 budget and, therefore, needs a closer analysis. First, the rise in reserves. The large build up of reserves in 1993-94 is a result of inflow of $ 1.5 billion on account of FII, $ 600 million of FDI, $ 1.5 billion of GDR and ECB, $ 300 million loan from the IMF and inflows under invisibles (Table 1)

Of the $ 7.6 billion rise in reserves in 1993-94, at least $ 3 billion represents liabilities which may have to be paid back at a short notice. This is on top of the $ 14.5 billion of NRI deposits which can start flowing out at the sign of any instability. The value of the $ 1.5 billion investments by FIIs is now much larger due to capital gains

Any instability could result in (a) stoppage of inflows which have built up the reserves and (b) substantial outflows. With large debt service payments coming up, the present cushion of reserves could prove to be inadequate. If NRIs also start withdrawing their deposits and flight of capital takes place along with underinvoicing of exports and overinvoicing of imports, the 'liquidity crisis' of 1991 would be back. With current account convertibility and the permission to exporters to hold accounts abroad, flight of capital has been facilitated. Legal import of gold and silver can add to the difficulties [Kumar 1992a].

The country's external debt today is larger than in 1991 and so are the debt service requirements. Even though the debt has hardly risen in 1993, the liabilities of the country (to outsiders) have risen sharply. Further, inflows on account of aid have turned negative and commercial borrowings are not yet available. No fresh flows are expected from the IMF Thus, the country is even more dependent on other private capital flows. These are generally of the hot money variety. To induce these flows, large concessions would have to be offered, to match those available in other countries

The FDI flows do not necessarily lead to availability of free foreign exchange [Kumar 1993b]. Associated with FDI are larger outflow of foreign exchange on account of royalty, technical fees, consultancy fees and purchase of capital goods and intermediate and raw materials. In some cases, FDI will not constitute any saving of foreign exchange since these are projects which need not be set up or could have been executed with local resources. This is the case with say soft drinks or most food processing and intermediate technology products or with say, power plants Today, foreign exchange could be borrowed more cheaply if so needed for some select critical technology inputs.

General opening up is economically expensive since it involves large concessions In the last two-and-a-half years the country has offered a variety of inducements to foreign capital to invest in Indian industry [Kumar 1994b] and help upgrade technology but with little to show for it Approvals of projects have risen sharply but actual inflows are a tiny fraction of the approvals. Even of the FDI inflows that have occurred, a large fraction is to acquire cheap assets in the form of equity at concessional rates—FERA companies have raised their equity to 51 per cent and above at a fraction of the ruling market price [Kumar 1993c].

Capital flows like those of GDR and FII are not enhancing the country's capacity to earn more foreign exchange. Money raised through GDR is being used to substitute for working capital and for playing in the stock markets Are they raising exports? Indeed, exports have risen by 20 per cent in $ terms, but there is no link with the above-mentioned capital inflows. In $ terms, agricultural exports have risen by 40 per cent and those of gems and jewellery by 37 per cent (Table 1).

Imports in $ terms have stagnated. The decline in the prices of petroleum products has helped. The low rate of growth of the industrial sector has slowed down demand for imports. There is also an additional factor related to underinvoicing of imports and dumping and the overinvoicing of exports Data are not yet available but it is being suggested that up to $ 1 billion may be involved If this is true, the current account deficit may be of the order of $ 1.5 and not 0 5 billion

III
Tax Reform

One of the key features of the 1994-95 budget and the earlier three budgets has been the reduction in the rates of customs duties. This has been accompanied by an increase in excise duties or their remaining unchanged. Thus, while imported goods have been cheapened, Indian goods have either increased in prices or have remained unchanged in value. Devaluation gave Indian goods protection. However, this works only to a point. Indian goods tend to lose their market share at home and/or the profit margins of the Indian producers are squeezed.

TABLE 1 CHANGES DURING 1993-94

Reserves up to February 1994 ($ Billion)		Exports up to September (Per Cent)		Imports up to September (Per Cent)	
Total	6.7	Total	21.3	Total	-3
FII	1.5	Agriculture	38	Food	-23
GDR, etc	1.5	Gems and jewellery	37	Fertilisers	-37
FDI	0.6	Metals	30	Chemicals	-32
IMF	0.3	Ores and minerals	32	Iron and steel	-20
NRI deposits	0.8	Manufactures	19	Gems and stones	23

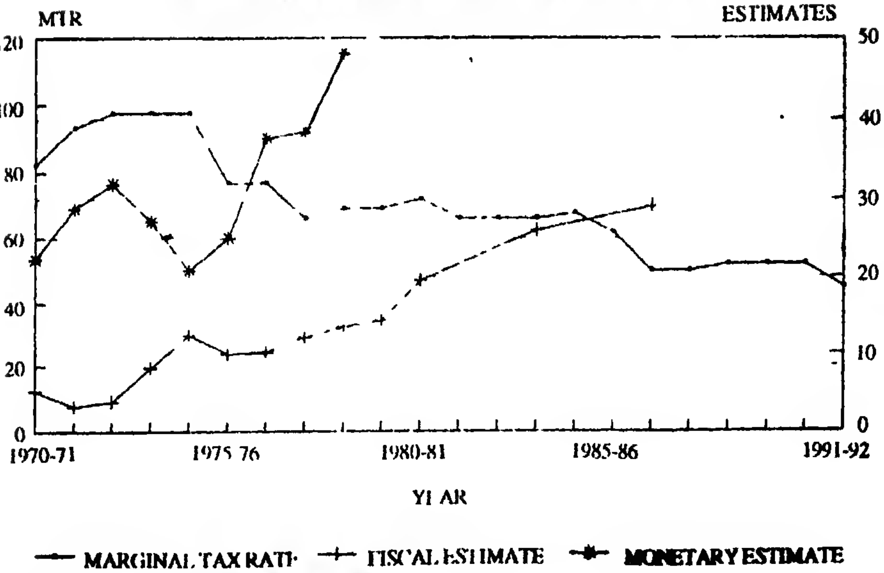
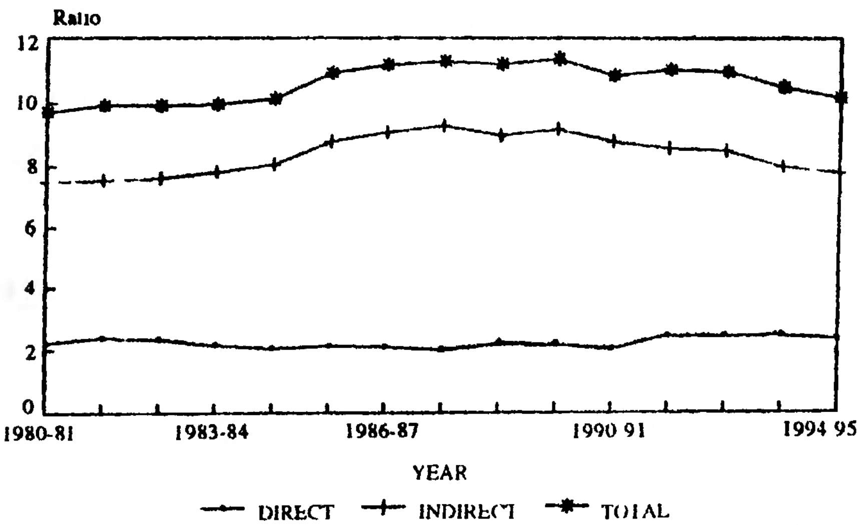
GRAPH 2: ESTIMATES OF MARGINAL TAX RATE AND BLACK INCOME



Sources: Saumya, 1993; NIPFP, 1985; IPFS, 1992

GRAPH 3: CENTRAL TAX GDP RATIO



Sources: *Public Finance*, 1992 and Receipts Budget, 1994 95. GDP has been projected using nominal growth rates

To compensate for this, direct tax rates need to be lowered. Rates of taxation for personal income tax and corporation tax have had to be lowered since 1991.

These rates are also required to be cut since it is a bait to attract foreign capital. Not only this, the rates have to be competitive with those prevailing in other countries which are also competing to attract foreign capital.

As a consequence of the reduction in rates of direct taxes and customs duties, revenue buoyancy has declined. The revenue deficit tends to grow. This requires cuts in expenditures or more borrowing or new sources of taxation or some combination of this. Extension of excise duties to services and replacement of specific duties by *ad valorem* ones and replacement by MODVAT at higher rates are some of the ways of raising more tax revenue. All these have been attempted in the budget for 1994-95, in the name of rationalisation and reform. New sources of revenue are also sought in disinvestment of PSE equity and extension of presumptive taxation to small businesses and the self-employed.

Reductions in expenditures (from trend) are easy only in social sectors, capital account and the Plan. Data for the late 80s indicate that as the deficits rose the real expenditure increase on social sectors slowed down (Table 2). Capital account expenditures actually fell in the last few budgets. These lead to the slowing down of the rate of growth of the economy, deterioration in the quality of life and inadequacy of infrastructure. This reduces the attractiveness of the country to foreign investors and, therefore, further inducements become necessary. An example of this is the concessions to foreign investors in the power sector and the opening up of the most strategic and profitable areas for foreign investments, like petroleum products and banking and financial services. The cost of trying to break out of the vicious circle of concessions, deterioration in profitability and budgetary crisis is indeed high.

Tax reforms have been initiated predominantly with the intention of opening up the economy. It has not been used as a tool for changing the fiscal policy regime to make it more rational and to overcome the problems encountered by the Indian economy [Kumar 1988 and 1994b].

IV
Supply Side Responses

It is often argued that cuts in direct tax rates will induce higher business profitability, larger investment and, therefore, a higher rate of growth. It is also suggested that lower tax rates will lead to better tax compliance, higher revenues and reduction in the budgetary deficit. Data do not support either of these arguments.

In India, direct tax rates have been reduced since early 70s but by most measures the share of black economy has risen (Graph 1). Further, the share of direct taxes as a fraction of GDP has only fallen since the mid-70s (Graph 2). Since 1991, under NEP, most tax rates have been cut, but revenue buoyancy has fallen and not risen.

If at all, tax compliance depends little on tax rates. Neither international nor national data indicate that a lowering of tax rates leads to an improvement in compliance. Other factors are far more important as pointed out in Singh (1973) and in the Indian context in Kumar (1985).[2] As such, tax cuts immediately lead to loss of revenues.

Would cuts in tax rates lead to higher profitability and increased private investments? Again this is a complicated relationship and depends on many factors. *Ceteris paribus*, a reduction in direct taxes leads to a fall in the gross profits and to no change in net profits [Kalecki 1971: 39]. In Kumar (1988) it was further argued that with the growth of the black economy, as the budgetary deficit increases, gross profits do not increase. It follows from these arguments that if the deficit is kept unchanged through increases in indirect taxes, then the gross profits actually fall [Kumar 1993a].

Finally, concessions to the propertied would seem to increase their disposable incomes. Would this result in additional demand and lead to a boost to growth? Usually, their consumption depends mildly

on their incomes and that too with a time lag and has a high import intensity so that even when it does generate demand it does not do so in the national economy. Immediately, these incomes have to be invested but that is determined by other factors [Kalecki 1971: 123] hence is not assured. Even if it happens, it does so with a considerable time lag. As such, *ceteris paribus*, demand falls in the economy, and the incomes of the propertied fall so that the disposable incomes remain unchanged [Kumar 1993a].

In sum, *ceteris paribus*, neither does the generation of black incomes nor does reduction in direct taxes lead to an increase in gross profits in the short period—gross profits fall while net profits remain unchanged. Lower direct tax rates do not lead to increased profits. This counter intuitive result is due to a decline in output consequent to a reduction in demand. Capacity utilisation and the rate of profit decrease. Excess capacity, decline in gross profits and a fall in the rate of profit lead to a disincentive to investment [Kalecki 1971: 123]. The conclusion is that profits improve with demand rather than with incentive to profits through tax cuts. The former is sure to raise profits while the latter may not. How has private investment responded in the last three years?

Even more than earlier, private investments are critical for growth. This is due to the reduced rate of growth of public investments. Capital expenditures in the budget have been reduced since 1990-91 and have gone up only now. Plan expenditures in real terms have grown little since 1991-92. So the source of additional investments has to be the private sector either Indian or international capital.

Unfortunately, as argued in Kumar (1993b), Indian private investment has not been buoyant because of excess capacity, profitability of speculative activities and the threat of entry of foreign capital and take overs. Even while foreign direct investment has not come in large amounts, the threat exists, and along with other reasons, the risk of investment has increased for Indian capital. As shown in Kumar (1993c) the rate of savings and capital formation of the corporate sector has fallen since 1991 in spite of the concessions granted to them. They have, however, raised record amounts in the capital markets but this has largely gone into speculative activities and not real plant and equipment.[3]

Foreign direct investment inflows remain small (only approvals have sharply risen) in spite of the concessions granted. Much of it is associated with FERA companies raising their equity from 40 per cent to 51 per cent and above. This has taken place at much below market prices and has been lucrative since it enables acquisition of cheap assets Investments in the power sector may now take place and, as earlier argued, will be expensive.[4]

The inflow of foreign capital for portfolio investment has only added to the instability in the Indian stock markets and is adding to speculative activities. More profits can be made in a few months in the stock markets than through investments in new plant and equipment in a few years. As already argued, this kind of investment does not even provide the government with a stable supply of foreign exchange and, therefore, it can be used only to limited extent to boost investments.

Availability of credit is seen to be criti to increased private sector investments. F this purpose, the government instituted fi nancial sector reform by lowering CRR a SLR. It has been argued that governme has been pre-empting resources and crow ing out private investments, so a reducti in the SLR would release resources for private sector

The SLR has been cut from 38.5 per c to 34 75 per cent and CRR from 15 per c to 14 per cent [GOI 1994: 40]. But due slack demand from the private sector cash-deposit ratio for all scheduled bar was 15 per cent and the investment-depo ratio at 39 3 per cent in October 1993. T credit-deposit ratio has been hovering a low of 54.6 per cent in comparison with value of 57 per cent in 1991-92 and 58.8 cent in 1992-93 [RBI 1993]. It is then not case that the public sector was pre-empti resources from the private sector; tod when credit is available, it is not bei utilised for lack of demand.

In the Indian economy it is not savin that are at the root of the problem investments. The rate of investment savings in the economy has fallen af 1991 [Kumar 1993c]. This appears to b direct result of slow-down in the rate growth of public investments and the co sequent slow-down in private investmen This is independent of any reform of banking sector and increased liquidity w the banks.

A decline in investment in agricult has been noted by the government [G 1994: 124]. If reform of banking impl

its privatisation and profit-making and results in reduction in priority sector lending and closing down of rural branches, agricultural investments would further decline. This can only slow-down the rate of growth further.

In a nutshell, supply side responses are not as yet visible in the Indian economy. While the growth rate of public sector investments has declined, the Indian private sector has not responded to cuts in direct tax rates or greater availability of credit or reductions in interest rates due to decline in demand and its fear of entry of foreign capital and take over threats. Foreign capital has come in only for portfolio investments and is of the hot money variety. It has not yet decided to enter with long-term commitment in new plant and equipment. Tax cuts have not yielded better compliance or revenue buoyancy in the past and are unlikely to do so now; the result is a worsening of the revenue deficit.

V
Price Rise and Cost Push

Even while demand is slack, prices continue to rise at around 10 per cent. This is all the more surprising after six good or average monsoons in a row since 1988. It is also strange given that the government has large reserves of foodgrains—23 million tonnes by November 1993.

The price rise since 1991 is largely of the cost push variety and has averaged over 10 per cent. Prices of agricultural commodities have risen the fastest in this period. Price increases notwithstanding, public distribution offtake has fallen sharply. The poor are unable to even buy from public distribution, wherever it exists. The public distribution has also been made ineffective by raising the issue price and bringing the ration price close to the market price. Due to build up of stocks, the average daily availability of foodgrains has declined sharply [Kumar 1994b].

Prices are also rising because of inflationary expectations. There was a steep pre-budget price increases of basic items of consumption (sugar, wheat, rice, petro products, etc). However, rate of inflation started rising even before these administered price increases. The freeing of movements of agricultural produce will make it even more difficult in the future for the government to control prices of these commodities.

There are several other cost push elements built into NEP. Reductions in subsidies force prices to rise. This is the case for water, electricity, transportation, foodgrains, fertilisers and medical and educational facilities. The public sector is being forced to raise prices because it is expected to generate larger profits and fund more of the Plan through higher internal and extra budgetary resources (IEBR). Their budgetary support is being decreased so that they are being forced to raise more expensive funds in the market. To cover these higher costs, they are forced to raise prices. Devaluation adds to cost push. Exports of agricultural produce has added to the inflationary expectations.[5]

It is a moot point what would happen to the rate of inflation if supplies of foodgrains are affected by an adverse monsoon and of this the probability has only gone up further after another average crop year. This would eliminate surpluses for export. If to maintain export growth at 20 per cent, agricultural produce is exported on large scale, the price rise can be steep. Given the liquidity in the system, the stocks with the government can disappear quickly. Its capacity to acquire fresh stocks through procurement would be limited by the elimination of zoning. Following its current policies, the government will raise procurement and public distribution prices as free market prices rise and this would set up a vicious circle of one price chasing the other.

Rise in food prices can trigger off a general price rise and a devaluation to keep exports going. Devaluation and further expectations of it could easily give a fillip to reverse flow of capital. With current account convertibility, the reverse flow of foreign exchange will be easy. Exporters and importers can hold back foreign exchange abroad and NRIs and FIIs can easily pull out along with their capital gains. All this could force a bigger devaluation than necessary and feed another cost push element into the inflationary spiral. The price front is precarious.

VI
Fiscal Deficit and Demand in 1993-94

Table 3 shows that the various deficits rose over the 1993-94 budget estimates (by 58 per cent and 110 per cent). This is rationalised on the ground that the economy needs a stimulus. It is argued, one must not make a fetish of budgetary prudence. Is it not the case that it is the government along with the IMF which suddenly turned fiscal prudence into a fetish in 1991? Further, it is unclear what the argument now being put forward amounts to since the fiscal deficit in 1994-95 is sought to be brought down from the level in 1993-94. Is it the case that the nation is simply hearing ex-post rationalisations of an out of control fiscal situation?

What is the character of the fiscal adjustment now being attempted by the government? Suddenly growth is stated to be more important than stabilisation. Given the large and growing reserves of foreign exchange and foodgrains, it is stated that an increase in the fiscal deficit will generate the needed demand and not be inflationary. It is argued that the Plan, the social sectors and the rural sector need to be given greater priority than hitherto (Finance Minister's Budget Speech 1994: 13).

Source: Budget at a Glance, various issues.

Indeed, in 1993-94, there was a large step up in all these expenditures even though the overall target was not achieved. But this trend has not been continued for 1994-95. In 1993-94, the projected increase in Plan size was 28 per cent and that achieved was 23 per cent. The budgetary support to the Plan was raised by 24 per cent, a large part of this was due to election give-aways and the need to give more to the states to enable them to utilise more external aid (by providing for matching funds) and slippages in the resource mobilisation by the public sector.

All this indicates that while the Plan size in 1993-94 was smaller than budgeted for, the budgetary support was larger. This was the result of unrealistic allocations but even then explains only 23 per cent of the increase in the fiscal deficit. The explanation for the sudden and large increase in the fiscal deficit in 1993-94 lies elsewhere.

The steep rise in the deficits in 1993-94 (over budget estimates) is the result of, first, increases in both Plan (budgetary allocations) and non-Plan expenditures and, secondly, shortfalls in tax revenues (Table 3). The increased budgetary Plan allocations have already been commented on.

The increases in non-Plan expenditures were largely due to increases in allocations for defence and subsidies. These were the result of unrealistic allocations in the 1993-94 budget. On the tax side, revenues were lower than anticipated since the base taken for 1992-93 was unrealistic and a high rate of growth was assumed for 1993-94 (see next section).

In spite of a step up in Plan expenditures, increase in the fiscal deficit and a decline in the current account deficit, the rate of growth of the economy did not pick up in 1993-94. It turned out that the industrial sector barely grew at 2 per cent instead of the anticipated 5 per cent and agriculture declined marginally instead of rising by 2 per cent. Hence excise collections did not reach the anticipated levels. Due to recession, imports fell by 1 per cent rather than rise by the anticipated 15 per cent and customs duty collections fell short.

It is then clear that the rise in the fiscal deficit in 1993-94 is a result of several factors and not just an increase in the budgetary support to the Plan. Actually the Plan target was not achieved; so this could not be the source of demand. What could be its impact on demand and, therefore, on the rate of growth?

The model presented in Kumar (1988) can be used to analyse this. To the extent the rise in the deficit is a result of the fall in direct taxes, demand is not stimulated. If it is a result of rise in interest payments, it generates no additional demand. If it is the result of increases in subsidies to the propertied classes, there is no additional demand generation. Hence, even though the fiscal deficit has sharply risen in 1993-94, its impact on demand generation is small. That is why growth remained sluggish. In a nutshell, the demand generated by any fiscal deficit depends on its characteristics.

VII
Out of Control Fiscal Situation: Fudging Figures

Table 3 reveals that since 1992-93 the budgetary figures have been greatly in error so that the budget figures cannot be dependend upon. With the union budget for 1994-95, fudging of budgetary figures has been raised to a fine art. This has been necessitated by the need to camouflage the real intentions. There may be more but two are obvious. First, to give a populist, yet a pro-rich budget (of which there are several features) and secondly, to further open up the economy.

Given the nature of all predictions, discrepancies between the budget, the revised and actual figures (Table 4) are likely. What is significant is the magnitude of changes in these figures in 1992-93 and 1993-94 and those likely in 1994-95. Earlier there was a tendency for errors to get corrected in the actual figures with the sign of the error changing. Since 1992-93, the errors are large and mostly in the same direction. In 1989-90 and 1990-91 also the errors were large but these were associated with special factors. 1989-90, was an election year and one in which there was a change of government. 1990-91 saw changes in government and non-governance.

The story of large changes begins with the union budget for 1992-93. This was the base for the formulation of the budget for 1993-94. That budget had to be projected as fiscally sound to give a rosy hue to NEP. It helped project the 1993-94 budget in a more optimistic vein. However, now it is clear that the fudges have come home to roost. **The fiscal situation is going out of control because the needed correctives were not applied. They were not needed if the situa**tion was under control.

A comparison of the budget estimates with the revised estimates (given in 1993-94) and the actual figures (given now) reveals the fudges (Tables 3 and 4). Revenues have been systematically overestimated and the deficits—fiscal, revenue and budget—underestimated. The intention was to demonstrate a healthier growth of the economy and to indicate fiscal prudence. The actual figures now available show that as compared to the revised estimates given at the end of 1992-93, the fiscal deficit is higher by 9.4 per cent, the revenue deficit by 11.2 per cent and the budget deficit by 71 per cent (Table 4).

The revised estimates were themselves higher than the budget estimates. The fiscal deficit was higher by 7 per cent, the revenue deficit by 21 per cent and the budget deficit by 34 per cent. Cumulatively, then the error in the budget estimates turn out to be 17 per cent for the fiscal deficit, 33 per cent for the revenue deficit and 129 per cent for the budget deficit.

The budgetary calculations for 1993-94 were based on the revised estimates for 1992-93. Since the latter were incorrect, the base for 1993-94 was in error and with further window-dressing, the figures for 1993-94 have turned out to be grossly wrong. As compared to the budget estimates for 1993-94, the revised estimates are off by 5[illegible] per cent, 93 per cent and 110 per cent for the fiscal, revenue and the budget deficits, respectively. Since these are not actual and the government has again overestimated revenues for 1993-94, the actual errors in the estimated deficits are likely to be even larger (Table 4 for estimates).

The growth rate being assumed for 1993-94 is an overestimate. This is being done to make the economy look healthier. In th

TABLE 4: PERCENTAGE CHANGES IN VARIOUS DEFICITS

Year	Budget Deficit		Revenue Deficit		Fiscal Deficit	
	Budget to Revised	Revised to Actual	Budget to Revised	Revised to Actual	Budget to Revised	Revised to Actual
1987-88	6.89	–4.34	26.03	7.53	5.72	NA
1988-89	6.09	–3.75	12.07	–4.67	7.20	NA
1989-90	60.15	–9.86	77.35	–4.21	24.59	–2.02

1992-93	33.64	70.95	20.30	11.22	6.74	9.38
1993-94	110.01	50.0*	93.18	13.2*	58.42	7.7*

* Likely, based on alternative calculations of likely receipts of revenue.

Notes: 1 1989-90 and 1990-91 show large errors in budget estimates. These were exceptional yea[rs] 1989-90 was an election year and therefore, expenditure went up. 1990-91 saw two gover[n]ments and non-presentation of the budget for 1992-93.

2 Usually errors for BE to RE are corrected by an opposite sign between RE and Actual. F[or] 1992-93 and 1993-94 the errors are not only large but in same direction. Hence errors in 199[3-]94 have got compounded.

Sources: *Budget at a Glance*, various issues, and *Receipts Budget*.

actual figures that will become available next year, the revenue figures are likely to be further revised downward and the deficits will then be revised upwards (an estimate is given in Table 5). The government is obviously depending on the shortness of public memory to keep its credibility intact.

On the basis of alternative calculations, one could hazard a guess on the size of the fiscal deficit (Table 5). Assuming that the revised estimates of expenditures are more or less correct and using the actual base of 1992-93 with a 12 per cent nominal growth in the economy and a 2 per cent real decline in imports one could make alternative estimates of tax revenue. These are likely to be lower by another Rs 2,000 crore. Due to PSE disinvestment not materialising, there will be a loss of Rs 2,500 crore. The fiscal deficit would then rise from 7.3 per cent to 7.9 per cent of GDP, the revenue deficit to Rs 38,000 crore and the budget deficit to Rs 13,500 crore.

Given that the revised estimates for 1993-94 will again change, the calculations for 1994-95 will also be in error. Further, to paint a rosy picture of the economy the government is again projecting an unrealistic growth rate for the economy (5 per cent). Buoyancy of taxes is being assumed to be high in spite of cuts in the rates of personal income tax, corporation tax and customs duties. Consequently, the revenue estimates are again likely to be in error because both the base being taken and the rate of growth assumed are unrealistic.

If alternative calculations are made (Table 5), conservatively assuming the revised estimates for 1993-94 to be correct but taking more realistic rates of growth, in 1994-95 net revenue would be lower by Rs 4,000 crore and expenditures higher by Rs 4,000 crore. Assuming higher PSE disinvestment, the fiscal, revenue and budget deficits would be 9 per cent, 22 per cent and 83 per cent higher than budgeted, respectively. Assuming that the actual taking for 1993-94 will be different from the revised estimates and taking more realistic rates of growth of expenditures, in 1994-95 revenue will be lower by another Rs 4,500 crore and expenditures will, at least, be higher by Rs 7,000 if the Plan size is maintained. The figures for deficits would then turn out to be 30 per cent, 51 per cent and 26 per cent, respectively higher than budgeted. As percentage of GDP, the figures would be 8.2, 5.7 and 2.6. These figures are comparable to the corresponding figures in the so-called crisis year of 1991.[7]

The question arises, when the budget is facing such imbalances and to correct for it essential expenditures may have to be cut, why is the government giving up revenue by cutting the rates of customs duties, corporation tax and personal income tax? Worse, with fiscal profligacy, why could it not have at least been done so as to promote growth in the economy which has been below average since 1991?

VIII
Growth and Fiscal Deficit in 1994-95

The revenue buoyancy expected in the budget will not materialise unless the rate of growth of the economy and of imports rises. The revenues in the 1994-95 budget seem to be estimated assuming a real growth rate of 9 per cent in industry, 6 per cent rate of inflation and a 25 per cent increase in imports. The present performance of the economy does not justify any of this.

The government is banking on a high rate of growth based on a larger fiscal deficit and higher Plan allocations. Reductions in tax

" 5 is calculated with (4) as base and assumptions given by government for 1994-95 budget.
" 6 is calculated on (4) with assumptions based on trends observed during the previous few years.
" 7 changes applied to column (6) assuming that elections are around the corner and the kind of revision to budget estimates in 1993-94 are again repeated in 1994-95.

rates are taken to lead to supply side responses and increases in rates of growth of industry and imports. Some variant of these arguments has been repeatedly made over the last three years. As already argued, in general there is not much substance in this line of reasoning but these propositions can be examined in the context of the 1994-95 budget.

In 1994-95, the Plan size is raised over the revised estimates for 1993-94 by 13.7 per cent whereas last year the projected increase was 28 per cent and that achieved was 23 per cent. The budgetary support to the Plan was raised by 24 per cent in 1993-94 but for 1994-95 it is being raised by 1.1 per cent. When last year in spite of a 23 per cent increase, the industrial sector remained mired in recession this year with a planned rise of 13.7 per cent and possible rise of barely 10 per cent, the Plan is unlikely to grow in real terms. With this and cuts in capital expenditures, prospects for growth can only be bleak.

The sale of PSE equity for budgetary support to the Plan is like selling off one asset to acquire another. Net assets do not rise by the amount of the disinvestment. To this extent the budgetary support to the Plan is less and its demand generating impact is lowered. If sale of PSE equity is used to reduce old debt, demand will decline.

The burden of the larger Plan is falling on the public sector. Given the precarious state of this sector, and that a large fraction of the equity of the profitable enterprises has been or will be sold, either administered prices will have to go up sharply or there will be a slippage in the Plan size. There is not much evidence of the centre's commitment to raising the Plan size. In brief, neither in 1993-94 nor in 1994-95 can the rise in the deficits be attributed to increased Plan size. Further, the rise in the Plan size is unlikely to stimulate additional demand in 1994-95 but will result in price increases.

What about boost to demand due to the slated rise in the fiscal deficit? But the fiscal deficit as a ratio of GDP is set to fall from 7.4 per cent to 6 per cent. If imports rise by 25 per cent, the current account deficit will rise sharply and this will curtail demand growth. What if the government's argument does not hold and the alternative scenario of Table 5 is realised? Then, neither will the fiscal deficit fall nor imports shoot up because growth will remain sluggish and revenues short of target.

Would demand then rise? And will it lead to increases in prices or in output? As argued earlier, prices are set to rise due to cost push factors. In 1993-94, prices of primary goods rose sharply because of sharp increases in procurement and public distribution prices. Other administered prices will rise since the public sector is to raise large resources while its costs are rising and sickness growing. Cuts in subsidies may not take place in 1994-95 but devaluation is likely. Output adjustment as a response to the general fiscal stimulus is then unlikely since it will be associated with price rise. Last year the fiscal deficit rose from 5.7 per cent of GDP to a likely 7.9 per cent but that did not revive the industrial sector. Would it do so this year?

Further, for 1994-95, the rise in the fiscal deficit is a result of increases in interest burden. As already argued, this recycles incomes and cannot stimulate demand. The primary deficit as it is called is set to fall from Rs 21,000 crore to Rs 9,000 crore In the alternative, it may be Rs 14,000 crore or Rs 24,000 crore. Either lower or a little higher and therefore unlikely to provide much of a stimulus and even that will be to raise prices as argued above.

In Section IV, it was argued that tax cuts have not led to supply side responses. This tendency for stagnation is further strengthened by some of the aspects of the 1994-95 budget. As argued in Section II, the steep cuts in customs duties while excise duty rates have either risen or have remained unchanged will dampen demand for Indian products with a few exceptions The slowdown of tempo of Plan expenditures will accentuate infrastructure bottlenecks [Kumar 1994b]. The rising rate of inflation has reduced demand from the middle and lower classes [an example of this is given in Kumar 1994b]. Any increase in disposable incomes due to tax concessions to these segments is more than compensated by inflation.

As argued earlier, concessions to the propertied and to industry in the shape of cuts in corporation tax and personal income tax cannot by themselves revive industry or boost investment. In the absence of demand, concessions do not work. Only speculative activities and hot money flows are encouraged. The union budget for 1994-95 gives a further boost to such speculative activities by lowering the capital gains taxes. As it is, it was lower than tax on productive activities. With all this, the ongoing recession i[n] Indian industry can only persist.

In brief, the prospects of the 1994-9[5] budget leading to supply side responses ar[e] bleak. With this, a rise in the rate of growt[h] of the economy will depend on the perfor[-]mance of the monsoon and in any case ther[e] cannot be a substantial rise. As such, ta[x] revenue will be short of budget expectatio[ns] and the fiscal deficit will be higher. How[-]ever, since it is based on large increases i[n] the interest burden and likely subsidies t[o] the vocal, well-off sections, its deman[d] stimulation effect will be limited and eve[n] that will be mostly absorbed by price ris[e] resulting from cost push factors. Hence th[e] prospects are for deepening stagflation i[n] 1994-95. Are there prospects for the situa[-]tion to improve in the future?

IX

Fisc Out of Control: The Future

Clearly, the union budget for 1994-9[5] indulges in the kind of fiscal profligac[y] never seen before. Suddenly after three year[s] of emphasising the importance of control[-]ling the fiscal deficit, the country is told tha[t] a high fiscal deficit is actually good for th[e] country. This is only an ex-pos[t] rationalisation of an out of control fisca[l] situation.

The steep rise in the revenue deficit i[s] cause for deep concern. It implies that th[e] government is borrowing heavily and wil[l] continue to do so and the interest burden wil[l] keep rising rapidly. In other words, with th[e] rising subsidy bill, defence burden and th[e] even more rapidly rising interest burden, th[e] non-Plan expenditures will continue to rise. To curtail the deficits, the growth in Pla[n] expenditures will have to be kept in check. This will only result in growing bottlenecks in infrastructure and cutbacks in socia[l] sector expenditures, like on drinking water health and education. Long-run growth wil[l] suffer. The alternative would be greate[r] private effort which is neither forthcomin[g] nor the solution to the problems facing the country.

TABLE 6. CHANGES IN FISCAL DEFICITS TO MAKE THEM COMPARABLE TO THE DEFINITION USED IN 1990-9[1]

	1990-91	1991-92	1992-93	1993-94	1994-95
Revenue					
(a) PSE disinvestment	—	3,038	1,961	2,500	4,000
(b) RBI profits	210	350	1,500	1,500	1,500
Total	210	3,388	3,461	4,000	5,500
Expenditure					
(a) Transfer to banks	700	700	700	5,700	5,600
(b) FCNRA exchange risk	—	—	—	—	5,721
(c) Additional interest on zero coupon bonds and PSE forced borrowings	—	—	—	—	500*
(d) Borrowings by FCI and PSEs	—	—	—	1,000*	—
Total	700	700	700	6,700	11,821
Addition to fiscal deficit	910	4,088	4,161	10,700	17,321

* Estimated.

Source: Receipt Budget, various issues.

The fiscal situation is in many ways orse than in 1991 It must be noted that e value of current deficits is not compa ble with those up to 1991 due to two ctors First, various one shot adjustments bring down the deficits are not going to available in the future Secondly the finitions of the deficits now and prior to 91 are different

Prior to 1991, there was no PSI sinvestment As noted earlier, this implies lower budgetary support to the Plan The ovision of Rs 5,700 crore last year and a ke amount this year for capital augmenta on of the banks is not being counted in the idget as capital expenditure since it is gued that the government is getting the oney back through bonds By the same gic, the budgetary support to the Plan is wer by the PSE disinvestment The provi on for the banks would not raise the budget the revenue deficits but the fiscal deficits ill be higher

The interest burden is being underesti ated PSEs are being forced to borrow and ar the interest burden (like the Food Cor ration of India) Recently zero coupon nds have been floated These only post ne the calculation of the interest from day to the date of maturity of these bonds he amount of the deficits is then higher by e amount of the underestimation of the terest burden It is also unclear how the terest on the money given to the banks is ing counted

One-shot adjustments in revenue like PSE sinvestment will not be available since ost of the profitable firms would soon ve been sold to the extent of 49 per cent he borrowings from RBI through *ad hoc* easury bills will be capped so that the large crease in borrowings in 1993 94 would t be available Due to policy rates of rect taxes and customs duties cannot be ised (as discussed earlier) because of pres res of globalisation Only excise duties n be raised but in the face of reductions in stoms duties the scope for this is limited ence revenue buoyancy will be low in the ming years

On the other hand expenditure cuts are ing to be difficult given the fact that one ot adjustments have already been made port subsidies have already been elimi ted If anything they will reappear in me other form to boost exports Further ts in food and fertiliser subsidies in the xt two years when elections are around e corner are unlikely There is not much ope for cutting employment and reducing e salary bill of the government for the me reason [6]

The rate of growth of grants and loans to e states and union territories has been wered and will be difficult to reduce fur er They are the ones who provide for most the expenditures on social and commu nity services (education and health, etc) and employment generation In the face of stagflation, reduction in these expenditures will face political opposition and will not be easy in election years Only a reduction in the size of the Plan may not face political opposition

In brief with one shot adjustments mostly exhausted and elections around the corner expenditures are likely to rise more sharply in the next two years than in the preceding three years while revenues will rise slower than in the last three years The increased revenue deficits will result in larger borrowings greater interest burden and worsening budgetary deficits Such a rise in deficits will not even stimulate much demand as argued earlier and keep the rate of growth low This vicious circle is the cause and the effect of a deteriorat ing macro scenario

X

Conclusion

The IMF and the World Bank should be unhappy with the loss of fiscal control implied by the budgets of 1993 94 and 1994 95 However opening up of the In dian markets and concessions to capital keep the G 7 IMF and World Bank happy even if the fiscal targets of stabilisation are not met [7] This situation will also deliver the country to them in a worst state in two years from now They will then be able to extract greater concessions than they have been able to obtain until now

It has been argued in this article that the economy is in a vicious trap of deteriorat ing macro scenario resulting from the op eration of NEP and the unwillingness of the government to face the truth On the contrary it is trying to present NEP as desirable for the economy and, therefore, unable to apply the needed correctives (Section VII) This may have been pos sible if the policy makers had faced up to the growing fiscal problems and the slow-down in the economy since 1991 itself and concluded that NEP are inappropriate for the nation

Dictates of globalisation (from NEP and new GATT) required lowering of customs duties and reduced public investments Both of these have meant a narrowing of the home market and a dependence on the private sector to promote growth This has required incentives to capital through direct tax cuts which has led to larger budgetary deficits and lower public investments (Sections II and III) These and other policies have shifted the share of national income in favour of the propertied and further narrowed the home market and reduced prospects of growth (Sections IV and V)

Changes in excise duties have compounded the problems for Indian industry NEP have not induced the expected supply side responses due to lack of demand in spite of the rise in the budgetary deficits (Sections IV, VI and VIII) but have resulted in cost-push inflation (Section V) This has simultaneously caused the fiscal crisis and slowed down growth Section IX points out that with one-time adjustments mostly exhausted and elections around the corner the fiscal situation can only worsen in the future and the manner in which this will happen will prevent growth from reviving The resort to fudges to dress up NEP is proving to be a one-way street to fiscal and economic crisis

There is an attempt at being too clever by half Perhaps an election year budget has been designed to keep the vocal sections happy However, the likely destabilisation of the economy can make things politically hot within the next few months, specially if the monsoons fail The rate of inflation can shoot up and flight of capital can make the present comfortable reserves position a thing of the past

The country is slipping into a situation worse than the one in 1991 At least then the country had certain instruments of control which have now been dismantled with NEP For instance, planning has been more or less discarded, the public sector is under liquidation, the economy is open to hot money flows and the international debt is much larger The pre 1991 situation was leading to a crisis but was accompanied by good growth in output and some employment generation In the present situation even this is unlikely A vicious trap—low growth and destabilisation

Notes

[I would like to thank Pankaj Jha for assistance with data work and many others who came to the Citizens Assembly and with whom I had discussions on the state of the Indian economy]

1 The tax reform steps may be welcomed from the point of view of NEP [GOI 1992] but not necessarily from the point of view of an alternative [see Kumar 1994b] In the latter, the total incidence of indirect taxes is sought to be lowered from basic and essential goods Customs duties are to be lowered *after* excise and sales taxes are reduced The issue is not just a rationalisation of taxes or introduction of MODVAT or VAT The context of rationalisation is completely different for the alternative

2 Businessmen are not even willing to pay a very low tax rate A presumptive tax was introduced on small business incomes They had to pay only Rs 1,400 per business with a turnover of up to Rs 5,00,000 Assuming a margin of 20 per cent, the tax rate worked out to only 1 4 per cent Very few have paid this tax Similarly, in Kumar (1985) it has been pointed out that even when in the past tax rates were substantially lowered, like on capital gains, compliance did not improve

3 If investments in real plant and equipment had risen, demand for capital goods and steel and cement would have shot up. However, these are precisely the sectors of industry facing demand recession. It is not even that large amounts of import of capital goods has taken place in the last three years. There has been a normal rise in imports of capital goods in spite of a large reduction in customs duties on these items.

4 This is expensive because foreign investors are guaranteed profits of 16 per cent post-tax or 32 per cent pre-tax and since return is to be in $ terms, with an average devaluation of 15 per cent it would mean a return of 47 per cent in rupee terms. Since this rate of profit is based on investments and the per Mw costs are high, the profits will also be high. It is clear that the power tariffs will have to rise sharply to enable these kinds of rates to be paid. If to avoid this, averaging is resorted to, it would imply cross subsidisation of power produced by these plants. It is likely that the State Electricity Boards will be unable to pay the high price. Then either the centre would have to pay up because there are sovereign guarantees involved or the boards would have to divert funds from payments to NTPC and other producers of electricity. Further, the rate of profit is linked to capacity utilisation. There will then be pressure to buy power produced by these plants before other power is purchased or utilised. Consequently, it is likely that subsidies and sickness amongst Indian producers would rise.

5 In the case of cotton, there was a shortfall in output and exports worsened the situation. In the case of sugar the sugarcane crop was lower and that has led to the diversion of sugarcane to gur and compounded the shortages of sweetners in the market. Exports of sugar and cotton had to be stopped in 1993-94. In the case of rice it is Basmati exports that have gone up and since their prices have firmed up, it has shifted internal consumption to other ordinary varieties. Indications are that this is causing a shift in cropping pattern from ordinary varieties to Basmati. This by reducing output of ordinary varieties of rice will lead to a further rise in their prices.

6 FIIs could ensure that they pull out with their capital gains by making the government keep the share market buoyant till they pull out. Most brokers trading on behalf of FIIs will also play ball by keeping these transactions secret so as to maintain relations for the future.

7 In Table 5 another scenario is also given. It is drawn on the assumption that elections will be held in 1994-95 and 1995-96. Hence, just as in 1993-94, for electoral reasons, expenditures were allowed to rise over the budgeted figures, the same would happen in 1994-95. This is the worst case scenario—the fiscal deficit will rise by 60 per cent, the revenue deficit by 74 per cent and the budget deficit by 233 per cent over their budgeted figures. In this scenario, the budgetary support to the Plan, subsidies and borrowings are all expected to rise. Revenues are expected to fall short due to further concessions and the rate of inflation is expected to rise to 12 per cent assuming a normal monsoon. As a ratio of the GDP, the fiscal deficit will rise to 9.8 per cent. If the fiscal deficit is calculated as it was till 1991, to make it comparable, then the fiscal deficit rises by another Rs 17,000 crore (Table 6) and would become 11.5 per cent of the GDP.

8 Even if the central government were to try and reduce its salary bill by reducing employment, the prospects are not very good (FM's interview in *ET*). The total employment by central government is estimated (*Expenditure Budget, 1994-95*, Vol 1, pp 84-85) to be 3.9 million in 1993 and 1994. Post and telecom employ 9.71 lakh, the railways 17.4 lakh, police 5.16 lakh scientific departments 60,000 and CPWD 40,000. Substantial cuts in these numbers may be difficult. Thus, those in pure administration, where substantial cuts may be possible, would be seven lakh. The total expenses on these four million employees is estimated for 1993-94 as Rs 14,600 crore. On the seven lakh in administration, the proportionate expenditure may be taken to be Rs 2,500 crore. Of the total central government expenditures of Rs 1,44,000 crore, that on staff is 10 per cent and on pure administration less than 2 per cent. The chances of substantial savings are not high but any inessential expenditures must be curtailed.

9 One only needs to recollect what happened during the 80s. The country borrowed heavily and moved towards the debt trap due to its profligacy and the fiscal situation deteriorated. The World Bank was not unhappy and while giving its backing constantly prodded the country to borrow more and to open its economy further. Further, even in 1993-94 the fiscal targets were exceeded but the support from the IMF continued.

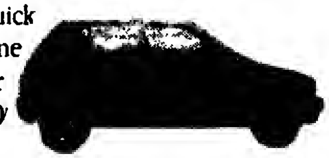
You're so protective about her, you'd never want to see her so heated up.

Overheating can be a problem when the engine oil is not right. Bharat Petroleum introduces Bharat Automol Super F 20W/40. A high performance multigrade oil that not only protects your car's sensitive engine over a vast range of temperatures but also enhances the oil change period, helping in oil conservation. (In some cases, the period as much as doubles). It helps quick starting, thereby increasing the car's battery life. It also prevents engine deposition, rust and corrosion, resulting in better fuel efficiency and longer engine life. Use Bharat Automol Super-F Multigrade Engine Oil 20W/40. And help your car keep its cool.



Bharat Automol Super-F Multigrade Oil 20W/40 makes oil sense for new generation petrol-driven vehicles like Marutis, Contessas, Standard 2000s, 118NEs and Imported cars. It can also be used in Ambassadors and Premier Padminis.

Implications of 1994-95 Budget for Growth and Stability

Tapas K Sen
M Govinda Rao
Madanmohan Ghosh

The government has been emphasising the need for wideranging economic reforms ever since the economy pulled back from the brink of a crisis in 1991. Some of the reforms have been pushed through, but one of the major reasons for the economic situation reaching a crisis point in 1991—the unsustainable fiscal imbalance—continues to hover menacingly over the economy despite being within the immediate control of the government.

The unwillingness and/or inability of the government to control its own expenditure in areas where they need to be cut has resulted in strategies to reduce the fiscal deficit (like cutting capital expenditure and passing on the adjustment burden to the states) which are questionable and counterproductive.

While these strategies continue to hold sway, the measures to promote investment contained in the latest budget are almost entirely confined to the supply side, although available evidence suggests that the problem lies on the demand side.

The strategy of sacrificing fiscal prudence (and possibly stability of the economy) in the interest of growth that has been advanced to defend the rising deficits is unconvincing; it will lead to neither growth nor stability.

TRADITIONALLY, the three major branches of government activity are taken to be resource allocation, distribution and stabilisation following Musgrave (1959). However, just two years after publishing his classic, Musgrave wrote, "I would prefer... to treat growth as a separate objective, pursued by an additional branch" [Musgrave 1961]. Indian fiscal policy appears to have rediscovered this addition lately, going by the various strategy documents and the professed overarching goal of putting the "economy back on a path of strong sustainable growth" (Budget speech of the Finance Minister, 1994).

The economic reform process, started in 1991 to pull the country back from the brink of economic crisis, is based on an underlying philosophy which emphasises stabilisation in the short run and growth in the long run. The strategy to achieve this consists of a package of measures on various points; *inter alia*, this includes exercise of financial responsibility by the government itself, redirecting government intervention from unnecessary controls and production activities in almost all areas to the provision of those goods and services which can really be provided more efficiently by it, and better integration of the Indian economy with the world economy. It may be noted that the traditional function of securing an acceptable distribution of income and wealth does not prominently figure in this policy package; none of the suggestions regarding a safety net for the poor and the unemployed are integral to the reform policy, though they may be essential for the package to be humane and for political reasons. A natural consequence is the cessation of foisting distributional objectives on to all kinds of policy measures, contrary to economic rationality.[1]

The 1994 95 budget is the fourth in the series of 'reform budgets' and enjoys the luxury of exercising some choices, which at least the first two did not have. It also gives us a chance to assess the actual figures of receipts and expenditures of the government of India for 1992-93, as against the revised figures (RE) given earlier, and the latter figures for 1993-94 as against what was intended (budget estimates or BE for short) or forecast.

I
Broad Trends

Table 1 shows the broad trends in the receipts, expenditures and deficits.[2] First, looking at the RE for 1992-93 and the actuals, the fall in every item of receipts except recovery of loans in the actual figures is striking. The most significant fall is in net tax revenue—from Rs 58,179 crore to Rs 54,044 crore, i e, a shortfall of Rs 4,135 crore. Revenue expenditures also fell (but by only Rs 2,278 crore), while capital expenditures rose marginally by Rs 168 crore (0.6 per cent). The net result was a rise in all the deficit figures. The revenue deficit rose by Rs 1,874 crore (i e, more than 10 per cent increase from the RE) and the fiscal deficit rose by Rs 3,451 crore (i e, a little less than 10 per cent).

In the light of the actuals for 1992-93, the budget estimates for 1993-94 were patently unrealistic in two items: tax revenue and proceeds of the disinvestment in public sector undertakings. In fact, it was pointed out soon after the budget estimates became available last year that the tax revenues were overestimated [Das Gupta and Mookherjee 1993], even without the benefit of the actuals for 1992-93. Now that we have the actuals, the expected increase (as per the 1993-94 budget estimates) appears naive, to say the least. However, the folly does not stop there. In the 1994-95 budget, net tax revenues are expected to grow by a little above 15 per cent over the RE for 1993-94. To be sure, this rate of growth is not very unusual. But in the present case, there are two reasons to believe that this may again be an overestimate. First, the RE for 1993-94 may itself be an overestimate, so that the implied growth rate is higher than the 15 per cent mentioned above. Second, the tax measures this year as a whole are overwhelmingly revenue-losing; the promised gains from better administration and compliance (and the rationalisation of 'exemptions by notifications' system in excise duty and customs) may be believed when the actuals become available; until then, a little scepticism may be in order. The pressure group activities that brought the notified exemptions and concessions about in the first place are not dead, not even dormant.

In this context, it seems a little odd that the RE (1993-94) of union excise duty is lower than the BE by Rs 2,000 crore, but the revised corporation tax receipts stay at the same level as the BE. After all, a part of the fall in expected excise duty collections must be due to less than expected growth in the value of production (the *Economic Survey* reports only a modest rise of 1.6 per cent in the index of industrial production during the first seven months of 1993-94, over the same period in the previous year; the inflation rate wa

lso below 10 per cent, so even that cannot aise nominal value of production or ominal profits to the levels needed for he required growth in tax receipts). To xpect a lower value of industrial production, but unchanged corporate profits ppears to be somewhat inconsistent. Now, he 1994-95 budget expects to raise receipts from corporate income tax by al- nost 19 per cent over the (probably overestimated) 1993 94 RE, after lowering the ax rates!

In contrast to the fall in both revenue eceipts and revenue expenditures in the ctuals for 1992-93 as compared to the :E, the 1993-94 REs show a fall in the xpected receipts but a substantial rise in ie revenue expenditures compared to the BEs, completely ignoring the much-ublicised 'fiscal responsibility'. The rise 1 non-plan expenditures works out to 8 er cent, while the plan expenditures are lated to rise by 11.6 per cent. The net esult is a virtual doubling of the revenue eficit from 2.2 per cent of the GDP to 4.2 er cent, and a rise in the fiscal deficit rom 4.6 per cent to 7.3 per cent of GDP Table 2). It must be remembered that the iscal deficit is high despite recourse to ne-time measures like the sale of public ector equity and adoption of questionable iethods like appropriating reserves of the ublic sector enterprises as well as profits f the Reserve Bank of India, and reducing apital expenditure.

In 1994-95, the ministry of finance in- ends to increase revenue receipts by 13 er cent and limit revenue expenditure rowth to 7.8 per cent over the RE for 993-94. We have already pointed out the likely overestimation involved in the tax revenue projections. On the expenditure side, the projected growth should be viewed against the fact that the growth of revenue expenditure has not been less than 12 per cent in any of the post-reform years; the probability of the actual increase being substantially higher than that projected reaches near-certainty. Thus, it seems quite likely that the revenue deficit in 1994-95 will be substantially higher than the Rs 32,727 crore projected, with the fiscal deficit correspondingly higher (unless the government has some cards like post-budget resource mobilisation measures up its sleeve).

II
Growth Implications

Since fostering economic growth is claimed to be the prime objective of the reform process, of which the present budget proposals are integral parts, we may examine these proposals against the stated objective, keeping recent trends in mind.

In essence, the major worry of the government appears to be the capital goods industry, the presumption being that:

(a) the growth of the economy is primarily determined by the investments in plant and machinery, and
(b) such investments are constrained by the non-availability of the required capital goods.

Running parallel to the policy of raising the supply of capital goods is the policy of lowering tariffs for imported capital goods for some industries to allow them to upgrade their technology and make their products competitive in the international market. This strategy is clearly aiming for export-led growth. The questions that need to be asked then are:

(i) are these strategies dictated by facts?
(ii) are they logically consistent?
(iii) are the budget proposals consistent with these strategies?

Growth is generally taken to be a result of investment (particularly in plant and machinery), although empirical studies reveal that productivity is at least equally important [De Long and Summers 1994]. Productivity is a function of the 'quality' of the factors of production (i e, technology embodied in the capital goods, and the skill of the labour force) as well as the level of investment itself. Thus, a comprehensive growth orientation must address the issues of raising the level of investment in the economy, speedy upgradation of technology, and raising the skill level of the labour force. The present strategy completely ignores the last, but addresses the other two, even if inadequately.

The present policy also makes the mistake of equating investment with production of capital goods industry. If savings has anything to do with investment, then the rising government dissavings are obvious dampeners for investment; the growing revenue expenditures and the resultant revenue deficits will pre-empt a large part of the household savings that could be invested. Also, the measures aimed at raising the production of the capital goods sector actually treat the symptoms rather than the disease, as without tackling the basic reasons underlying the stagnation in

the capital goods industry, the budget only provides sops to them. This is not the first time that the capital goods industry is producing well below capacity; the same phenomenon has been observed earlier also [Shetty 1978; Ahluwalia 1985; Pradhan 1990; and Maiti and Rao 1994]. While the stagnation can theoretically be due to one or more of several factors representing the demand for and the supply of capital goods, empirical analyses [Maiti and Rao 1994, for example] usually trace the problem to the demand factors. Prominent among them is the capital expenditures by the government sector. This is important for the capital goods industry due to three different reasons:

(a) The investment in plant and machinery by the government sector constitutes the major part of the demand for capital goods in the country;
(b) Capital expenditure on infrastructure helps the capital goods industry in removing its supply bottlenecks, if any; and
(c) Public investment in infrastructure encourages investment in consumer goods industries also, which in turn reinforces demand for capital goods.

Unfortunately, expenditure by the government sector as a whole, and by the central government as well as the states separately, have remained stagnant in real terms since the beginning of the last decade. The share of capital expenditures in the total expenditures show a continuous decline over the last several years and since 1987-88, the per capita expenditure in constant prices has also fallen [Rao and Sen 1993]. Taking the post-reform period itself, capital expenditure of the central government has remained virtually stagnant from 1990-91 (Rs 31,782 crore) to the BE for 1994-95 (Rs 32,888 crore) even at current prices (Table 1). As a ratio of GDP, it has actually fallen from 6 per cent in 1990-91 to only 3.6 per cent in the BE for 1994-95 (Table 2). Even considering the capital expenditure (inclusive of loans) on the infrastructural sectors only—transport, communications and energy—a similar trend is discernible (Table 3). From 11, 7.7 and 1.3 per cent of the total capital disbursements in 1990-91, the shares of these sectors came down to 8.3, 9.1 and 0.2 per cent respectively. The BE for 1994-95 intends to bring down the share of these three sectors further to 10.4 (this would be an increase, but not enough to restore the 1990-91 proportion), 5.9 and 0.1 per cent respectively. Under the circumstances, it is not surprising that the capital goods sector is not recovering. What is worse, the present budget actually intends to cut capital expenditure even in nominal terms from Rs 33,648 crore in 1993-94 (RE) to Rs 32,888 crore. This is certain to affect the capital goods industry adversely.

There is another possible reason for the relative stagnancy of the capital goods industry. It is, after all, common knowledge that import duties are being reduced in stages; producers of those capital goods whose import content is non-negligible may actually be waiting for the import duties to touch the targeted bottom; instead of importing now and paying higher import duties, they may prefer to import later and save on the customs duty payable on their imports. If this surmise is correct, then it would have been perhaps better to cut the import duties to the targeted levels in one go rather than doing it in stages, although it would have created difficulties for the domestic producers by requiring them to adjust to the changed circumstances immediately.

Another way of bringing about growth in the economy is to promote foreign investments. Even if it is assumed that the net effect of such foreign investments will be beneficial for the economy, it cannot be taken for granted that their inflow would start immediately after we open our doors, in sufficiently large quantities and in those areas where investments are most needed, to push up the rate of growth significantly; our policies and institutions may not simply be attractive enough for the greatly mobile internationally investible funds, which have several alternative opportunities with the opening up of the east European economies including Russia and China. Guaranteed rates of return (as being promised for the power sector) and reduced rates of corporate income tax (and capital gains tax) on foreign companies (as announced in the present budget) may not be an adequate offset to the institutional disadvantages of producing in India, particularly if it becomes possible to produce outside India and still take advantage of the vast Indian market for sales [Mookherjee 1993].

The reduction in the lending rate by one percentage point announced in the present budget is a step designed to lower the cost of capital and encourage investments. This is again a supply side measure; the direction of its impact is unambiguous, but its significance is unknown, especially because the demand for investible funds is governed by an entirely different set of factors represented by the expected rate of return.

Other tax measures designed to promote investment and growth proposed in the present budget mainly relate to reduction in basic customs duty on project imports and general capital goods (from 35 per cent to 25 per cent), reduction in customs duty on some inputs of the domestic capital goods industry, and selective concessions granted in excise duties and customs. The extension of MODVAT to the petroleum and capital goods sector may also be taken as a measure towards the same end. Although the countervailing duties are designed to prevent a large scale substitution of demand for domestically produced capital goods by imports if the quality of and the technology embodied in the imported capital goods are perceived to be better, then such a substitution may still take place. The simplification of the excise duty rate structure w

ong overdue; it would help reduce a substantial wastage of resources that was involved in disputes, litigations, and tax voidance strategies spawned by the comlicated structure The extension of MODAVT is also a positive measure, kely to reduce inefficiencies resulting om the cascading of the tax The reducon in corporate income tax for domestic ompanies would increase their profitbility, and may thereby encourage inestment. Also, if their products are to ompete in the international market, then he taxes they pay should not become the ecisive handicap. In this context, it should e pointed out that an overhaul of both the ompanies Act and the structure of the orporate income tax (particularly with espect to the surcharge levied, and the uestion of integration of personal inome tax and corporate income tax) is still ending.

On the expenditure side also, there is ittle that can be construed as growthnducing. We have already pointed out the tagnation in capital expenditures and its negative impact on growth. Although revenue expenditures have grown fast, the growth has been in areas that may not raise investments by any appreciable amount. The increase of Rs 23,378 crore in revenue expenditure in 1993-94 (RE) over the 1992-93 figure as per the *Annual Financial Statement* works out to an increase of about 20 per cent (Table 3). Out of this, the increase in three key infrastructural sectors of energy, transport and communications accounted for only Rs 5,686 crore—Rs 546, Rs 3,045 and Rs 2,095 crore respectively;[3] in contrast, interest payments alone went up by Rs 6,465 crore. The BE for 1994-95 projects an increase of only Rs 3,516 crore in the revenue expenditure on these three budgetary heads, while interest payments are slated to go up by Rs 8,500 crore. These numbers clearly show that although revenue expenditures of the central government are increasing fast, it is not due to increases in expenditure on the infrastructural sectors. Coupled with low capital expenditures, such a trend implies inadequacies in both investments in and maintenance of infrastructural services. The growth implications of this cannot but be negative.

It thus appears that on the whole, the elements of the present budget designed to encourage growth may not be sufficient, on their own, to achieve the stated objective. In our view, this is mainly due to the abiding faith that the present budget seems to have in supply-side policies although the weight of evidence suggests that at the present juncture, the demand factors, capital expenditures by the government sector in particular, are more important. An important factor influencing demand for investment is macro-economic stability. All investors value stability because they always base their investment decisions on expected values of relevant variables; any significant instability throws these calculations awry and increases the risk involved. In other words, the risk discounted rate of return on capital (which is the highest cost of capital at which investments can be undertaken) is lower in unstable economies than in stable ones. This

inevitably results in lower investments in unstable economies and lower growth in turn. Therefore, stability is not just a short-run concern—it has significant long-term effects. It is to this aspect of the budgetary policy that we turn now.

III
Stability Issues

By now, it is widely recognised that large and persistent fiscal imbalance right from the early 80s was the principal cause of macro-economic and balance of payment difficulties, which eventually led to a severe economic crisis in the latter part of 1990. After a phase of political instability when the new government came to power in June 1991, a series of measures were taken to restore macro-economic stability. A critical component of this programme was fiscal compression. After four budgets, it is important to evaluate the extent of success of the government in achieving fiscal prudence. Unless the basic factors which contributed to the fiscal imbalances are identified and corrected, there is every likelihood of the economy reverting to the crisis situation. Besides, the methods of fiscal adjustment can have adverse repercussion on economic growth in the medium- and long-term context, particularly if the adjustment is achieved by compressing capital outlay and maintenance expenditure in the infrastructural sectors.

It has been pointed out by several commentators that the emphasis placed on reducing fiscal deficit to achieve fiscal correction was clearly inappropriate [Rakshit 1991]. In particular, the concept of fiscal deficit neither gives an idea of the extent of governmental dissaving, nor does it indicate the inflationary potential of the budget. In fact, the fiscal deficit figures can be manipulated by undertaking disinvestment or resorting to measures like appropriating the profits of the RBI (which was earlier used mainly for refinancing) and drawal of reserves and surpluses of public enterprises (which could have been used for reinvestment). It is also possible to reduce the fiscal deficit by compressing investment and maintenance expenditures on social and economic infrastructures which, as mentioned earlier, could have adverse effects on economic growth. Yet, the government continued to target fiscal deficit reduction partly to fulfil the IMF conditions and also because, targeting fiscal deficit rather than 'revenue' deficit gave it larger flexibility.

What is, however, a matter of concern is that the government could not reduce even fiscal deficits as planned, despite adopting the questionable methods mentioned above. The fiscal deficit-GDP ratio was reduced from 8.4 per cent in 1990-91 to 5.7 per cent in 1992-93, but thereafter it increased sharply to 7.3 per cent in 1993-94 (RE) and is budgeted at 6 per cent in 1994-95 (Table 2).

The disaggregated analysis of the revenue and expenditures of the union government brings out the trend in fiscal deficit in terms of its various components. The figures presented in Tables 1 to 4 bring out several notable issues, some of which we outline below.

The fiscal deficit fell during the first two years of the reform from 8.4 per cent of the GDP to 5.7 per cent of GDP, but increased sharply to 7.3 per cent in 1993-94. Although, it is budgeted at a lower level of 6 per cent in 1994-95, recent experience casts doubts on the ability of the government to restrict the deficit at that level particularly when 10 states are scheduled to go to the polls during the year. This reduction of 1.3 percentage points is expected to be achieved by reducing mainly the non-plan revenue expenditure (0.6 points) and plan capital expenditure (0.5 points). An objective assessment of the fiscal situation however, casts doubts on the ability of the government to restrict the deficit at this level for two different reasons. First, it is doubtful whether the government can contain the expenditure at the budgeted level which is projected to grow at only 5.5 per cent as compared to the growth of 17.4 per cent in 1993-94 and 11.9 per cent in 1992-93. In fact, the revenue expenditure is projected to grow at 7.8 per cent and revenue expenditure excluding interest payments is budgeted to remain at the same level as in 1993-94 (RE) even in nominal terms. At the same time, the number of employees is expected to increase by about 40,000. As inflation reaches the double digit level, it is difficult to see how the expenditures will be contained at the budgeted level. Second, in spite of removing the surcharge on personal income tax, reduction in corporation tax

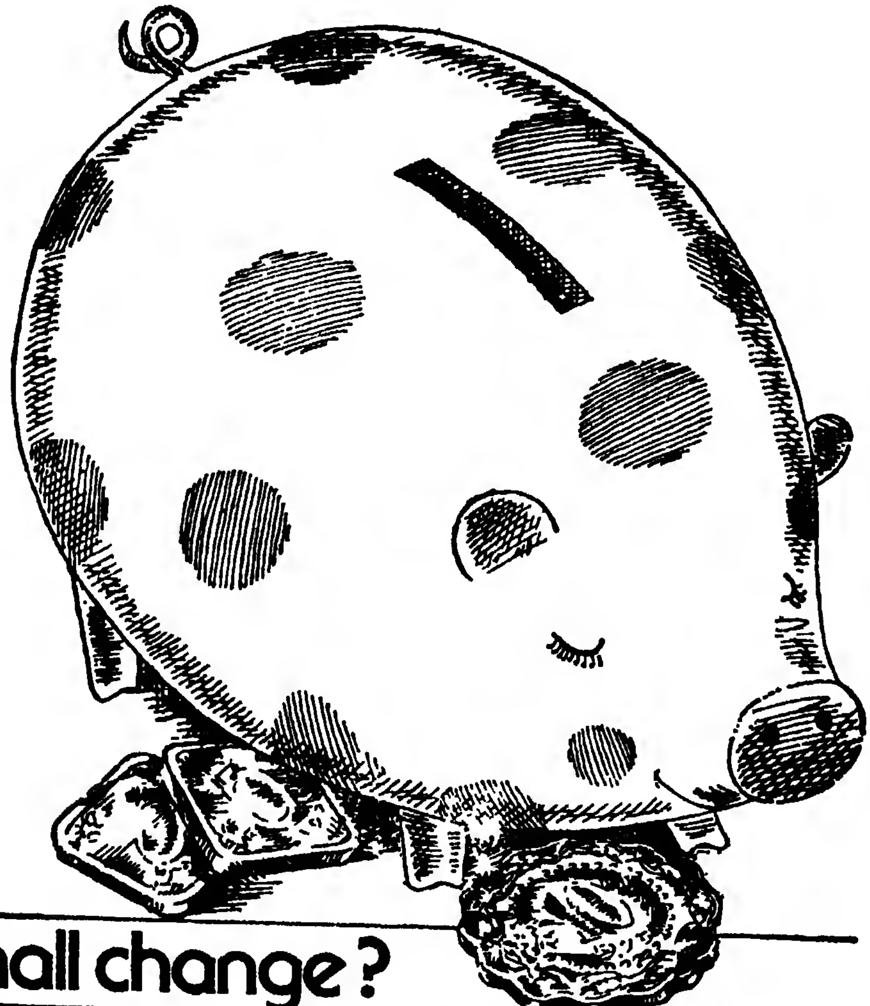
Source: Budget documents of relevant years.



rates and import duties, the tax revenues are expected to grow at 13.5 per cent in 1994-95. The expected loss of Rs 2,600 crore in tax revenue has been simply assumed away. It may also be noted that the revenue from corporation tax is budgeted to increase by 18.9 per cent and that from union excise duty by 15.6 per cent. The present industrial climate does not provide any basis for such an optimistic estimate. Coming on the heels of the high deficit in 1993-94, a high deficit in 1994-95 could seriously undermine stability.

As mentioned above, during the first two years of fiscal adjustment, the fiscal deficit was reduced by 2.7 percentage points (from 8.4 per cent to 5.7 per cent). This was achieved mainly by reducing capital expenditures (1.8 percentage points). What is more, even the sharp increase in fiscal deficit in 1993-94 was due to rising revenue expenditures and the proportion of capital expenditure to GDP in the year was constant at 4.2 per cent and is budgeted to decline further to 3.6 per cent in 1994 95. Thus, the finance ministry's claim that the increase in fiscal deficit in 1993-94 (RE) over budget estimates was a result of the attempts to revive the demand factors, particularly for the capital goods industry, in an underheated economy is unsustainable. The increases in specific revenue expenditures that are primarily responsible for the larger deficit (along with the lower tax collections) cannot easily be seen as stimulating investment in the economy.

It is seen that while the increase in fiscal deficit in 1993-94 was occasioned by an increase in the revenue deficit, the reduction in fiscal deficit in the first two years of the reform was achieved mainly by compressing capital expenditures. Thus, in the first two years of adjustment, the revenue deficit showed much less downward flexibility as compared to capital expenditures. Taking these as ratios of GDP, the decline in the former was just about 0.9 percentage points, while that of the latter was twice that number (1.8 points). Within the revenue account, the revenue expenditure could hardly be compressed. In fact, after three years of adjustment in 1993-94, the proportion of revenue expenditure of GDP stood almost at the same level as in 1990-91. At the same time, the tax-GDP ratio actually declined by 1.4 percentage points. Though this was partially offset by increases in non-tax revenues (0.4 points), the revenue deficit position worsened in 1993-94 as compared to 1990-91.

The ratio of non-plan revenue expenditure to GDP showed a decline of about 1 percentage point in 1993-94 over 1990-91, and this was mainly due to the decline in defence expenditure, subsidies and grants to state governments (Table 4). The plan revenue expenditure, in contrast, showed a steady increase. The decline in capital expenditure was mainly due to reduced capital assistance to states, particularly on the non-plan account.

In many respects, the quality of fiscal deficit in 1993-94 was inferior to that of 1990-91. First, the share of revenue deficit in the fiscal deficit in 1993-94 was as much as 57.5 per cent as compared to 41.7 per cent in 1990-91. Second, in 1993-94 the share of capital expenditure in GDP at 4.2 per cent was much lower than that in 1990-91 (6 per cent). Third, while the fiscal deficit in 1993-94 was lower by about one percentage point than in 1990-91, this has been achieved by taking away profits and reserves of RBI and public enterprises which could have bee used for refinancing or for reinvestments.

The discussion above does not bring o any budgetary developments that would ju tify optimism with regard to stability; t sad fact is that even after four reform bu gets, stabilisation remains an elusive go The finance minister has taken the credit f reducing the inflation rate from 17 per ce in August 1991 to 8.5 per cent in Februa 1994. This must be attributed more to t favourable monsoons in the last three yea (and the absence of any external shock) th to the fiscal corrections undertaken by t government. Further, the foodgrains ou put in recent years has not shown an increa

ing trend but has stabilised around 170 million tonnes, which is barely adequate to feed the population. Even with the buffer stock of 23 million tonnes, a bad year for agriculture can quickly create a highly unstable situation.

It must be noted that it is the states which have a greater role in providing adequate social and economic infrastructure, and the prospect of both agricultural and industrial growth will hinge on the ability of the states to provide these services. At the same time, given the spiralling expenditures on interest payments, wages and salaries and subsidies, the states' ability to provide infrastructural facilities will critically depend upon the resources available and more particularly, the central transfers. An analysis of the central transfers to the states in the context of the centre's own expenditure compression is therefore necessary to examine the prospects of infrastructural availability.

IV
Transfers to States

From around the middle of the previous decade, states as a whole have started to show revenue deficits in their budgets. Relatively rich states like Punjab, Haryana and Maharashtra also have not been able to contain their revenue expenditures within the revenue receipts in recent years. Those states that did show a surplus did it at a very low level of expenditure. Since contractual payments like interest payments take precedence over other items of expenditure, and because wages and salaries and various subsidies appear to be priority items (probably due to political economic factors), expenditure on economic services and capital expenditures in general have borne the brunt of the scarcity of resources. For the relatively poor states, central transfers often form a substantial part of their resources; in the present scenario, these have become important for almost all the states. In this situation, the impact of the central budget can be felt through the impact of the state budgets also, although it would not be readily identifiable as such.

Tables 5 and 6 show the trends in central transfers to states and union territories (simply states for the sake of brevity) during the recent period. One of the interesting facts to be noticed is that the share of net central transfers to states as a ratio of GDP has been declining steadily in recent years; from 8.2 per cent in 1985-86, it fell to 6.3 per cent in 1990-91, and fell further to 5.7 per cent in 1993-94 (RE). The present budget seeks to lower this ratio further to only 4.8 per cent. If we look at the trends in fiscal deficit as a ratio of GDP, it becomes apparent that much of the burden of reducing the fiscal deficit has been passed on to the states. Between 1990-91 and 1993-94 (RE), fiscal deficit has fallen by 1.1 percentage points, of which 0.6 points have been achieved by reducing net transfers to states. In the present budget, of the 1.3 percentage points reduction in fiscal deficit intended, 0.9 points are slated to be through cutting central transfers further. These figures show clearly that the centre has shifted the larger share of the adjustment burden on to the states, and at least intends to do so in the year 1994-95 as well. Given the difficulties that the states are having in raising enough resources to meet the growing expenditures, the dwindling central transfers (relative to GDP) are likely to cause cutbacks in the sectors which are most vulnerable. Previous studies [Rao and Sen 1993, for example] indicate that capital expenditures and the maintenance of capital assets are the first casualties of resource constraints. This possibility reinforces our reservations regarding growth prospects expressed above

Of the planned reduction in net central transfers to states in the present budget amounting to 0 9 per cent of GDP, 0.7 percentage points are through reduction in plan transfers Although it is difficult to posit a strong relationship between plan expenditures and development in any particular state, the likely drop in plan expenditures at the state level as a result of the reduced central assistance may have an adverse long-term impact on the economy. The higher proportionate reduction in capital transfers to states, as compared to the current transfers, can have a similar effect through lower investments by the states. In fact, Table 6 shows that net capital transfers as a ratio of gross receipts of the centre show a steady fall since 1990-91, from 10 per cent to 6 per cent in 1994-95 (BE). The rise in 1993 94 (RE) is an exception to this falling trend. If these capital transfers actually translate into investments by states to a substantial extent, then the negative impact of this trend can be easily gauged

V
Concluding Remarks

The government of India has been emphasising the need for widespread economic reforms ever since the economy pulled back from the brink of a crisis in 1991. Some of these reforms have been pushed through, others are in the process of implementation and yet others are on the anvil. One of the major reasons for the situation reaching almost crisis point, viz, unsustainable fiscal imbalance, however, continues to hover menacingly over the economy despite being within the immediate control of the government. The unwillingness and/or the inability of the government to control its own expenditures in areas where they need to be cut has resulted in strategies to reduce fiscal defici (like cutting capital expenditure and pass ing on the adjustment burden to the states which are questionable and counterpro ductive. While these strategies continu to hold sway, the measures to promot investment contained in the latest budge are almost entirely confined to the suppl side, although available evidence suggest that the problem lies on the demand side We have also argued above that the strat egy of sacrificing fiscal prudence (an possibly stability of the economy) in th interest of growth that has been advance to defend the rising deficits i unconvincing, such a strategy would lea to neither growth nor stability.

Notes

1 As an example, see Chelliah (1994) for a cr tique of the attempt to incorporate equity con siderations into the tax policy.

2 All the figures in this section are taken fro *Budget at a Glance* for the relevant years.

3 The figures for 'communications' actually over estimate the expenditure as a large part can b described as only book entry and not really a outgo from the government sector on the give budgetary head.

Waiting for Private Investment

Pulapre Balakrishnan

While the economic reforms appear to have had a positive effect on the trade balance their impact on production, reflected in the figures for industrial growth, is far from evident. The budget reflects the government's concern for reviving this segment of the economy. However, the efficacy of the instruments chosen is not assured. The slow growth of capital goods production suggests that this is very likely due to slack investment outlay. The private sector appears to be waiting for recovery. In the absence of a strategy to precipitate private activity the government is going to be left waiting for private investment. A simple measure that might have helped a little is recommended in this essay. But even this can only be a palliative. The most elementary analysis of events in the past three years points to the reason for the slow growth of industrial activity. This is the slow growth of capital spending by government.

EVEN though the government has ensured continuation of the process of liberalisation of the trade and payments regime, it is the performance of the industrial sector that emerges from a reading of the budget for 1994-95 as the focus of concern. The reason for this concern is obvious, for the economic reforms have little to show in terms of the performance of this segment of the economy. It is striking that the manufacturing sector of the economy has grown at less than 2 per cent for the third year running. The government has rightly observed that the problem lies in the (negative) rate of growth of capital goods production, and the budget even suggests that it has recognised that this is very likely related to a continuing in slack private investment. However, much as the government needs an investment-led recovery, I argue that the strategy that it has chosen to adopt cannot be expected to bring about a very marked reversal of the present situation.

From the macro-economic point of view, the provisions in the union budget for 1994-95 follow inexorably from the flood of public expenditure in 1993-94. It signals the end of fiscal correction, and this is unfortunate. For even as one might have disagreed with the government's interpretation of macro-economic stability as a specific number on the 'fiscal deficit' and recoiled from the simple-minded offerings about the impact of the deficit on inflation and the balance of payments, any sensible economist would hold that a significant overhauling of the country's public finances is long overdue. This budget points to little progress having been made in that direction. An instance of this indigence is the overshooting of the estimate on the primary surplus by over 2,000 per cent. We are presented with the spectacle of a government that has repeatedly stressed fiscal discipline now no longer in control of the exchequer. In fact, the 'raising' of the target on the fiscal deficit for 1994-95 indicates precisely this. The logic of the Budget now lies unmasked. An exhausted government now waits for private investment to revive the economy.

In what follows I take up first the question of the macro-economic stabilisation allegedly being pursued by the government and turn next to the strategy for an economic revival contained in the budget.

I
After the Deluge the Bonfire of a Verity

A most egregious aspect of this budget is the reversal of the government's avowed commitment to 'fiscal correction'. Recall that the government has interpreted this to mean a reduction of the fiscal deficit, without any obvious concern for where the cuts fall. In fact, the reduction of the fiscal deficit has been the lodestar of the macro-economic stabilisation programme over the last three years. Now, coming into the fourth year of the programme the government has done a U-turn. I do not refer to the very considerable overshooting of the target for the deficit in 1993-94, but the fact is that the target for the coming year has been raised (from 6 per cent of GNP to 4.7 per cent). Thus, having berated us for three years on the need for macro-economic discipline, on the inflationary consequences of the deficit (though, even granting monetarist logic, it was harping on the wrong one), and, most intriguingly, on how "growth cannot be bought", the government has, quietly and without much ado, abandoned the verity that the reduction of the deficit is of the essence, and, more crucially, that it is all that is needed for growth to take place. But there is a backdrop of developments in the economy against which this has occurred, events that have given the government the confidence to proceed, as it were, and it is to this that I now turn.

State of Economy in 1993-94

(i) *It's hunky-dory on the external front*

There can be no doubt that there is a turnaround in the balance-of-payments. A portmanteau indicator of its health is the level of foreign exchange reserves. While the windfall represented by the capital inflows is certainly a part of the story, there can be no doubt that the trade balance has improved very substantially. Moreover, this improvement has been significantly contributed to by the quite impressive pick-up in export earnings rather than by a recession-induced slow-down in the growth of imports. The consequences of these developments, especially for the subsequent moves of the government, remain unaffected by the query as to whether export figures reflect an increase in export earnings *per se* or only an increase in their repatriation following upon the floating of the rupee for commodity transactions. Recall that the unification of the exchange rate since April 1993 had removed the incentive to stash money away abroad. However, the fact remains that policy is somewhere responsible for the export performance, and the government can take credit for it. Finally, the government has chosen to repay a substantial part of the IMF loan ahead of time. Doubtless, it will make capital out of it, but then this is high politics and so had the government's detractors gone to town when it had gone in for the loan in 1991. In general, anyone wishing to retain some credibility even as a critic would be making a mistake not to recognise the developments on India's external front for what they are. There can be no doubt as to some success here.

(ii) *Prices: Yet single-digit inflation*

While the inflation rate in the year just completed is perhaps higher than the rate in the previous year, it is still below the two-digit mark and, arguably, steady. More importantly, and even though the government can take little credit for it, in the public mind, inflation is down compared to what it was when the present government took over.[1]

(iii) *Industry: Slow train coming*

However, the purple patch in the backdrop is the recession-ridden industrial sector. For the third year running we have had

growth of less than 2 per cent Apart from the matter of the loss of potential output and the consequent employment growth, slow growth of the industrial sector is damaging o the arguments for the type of reform that we have witnessed so far For it is from the ndustrial sector that one would have ex pected the largest response to the iberalisation process in general

iv) Public expenditure Swinging'

Clearly, it is with these three develop nents in mind that the decision to backtrack on fiscal 'correction has been undertaken With the external imbalance appearing sus ainable right now and the inflation rate otentially under control since the stock of oodgrains is substantial the government as apparently chosen to make a dash for rowth In any case, it must have noticed hat the very large increase in the fiscal leficit during the current year has not sty med an improvement in the current account or led to a much higher inflation rate But here is obviously a fourth aspect to which he slow-down on the reduction of the fiscal leficit is related This is the flood of expen liture that has occurred in 1993 94 Since so nuch of the current discussion of policy in he Indian economy is in terms of deficits t is interesting to note that of the four efinitions of deficits in the budget the overnment has overshot the budgetary es mates by over 100 per cent in the case of ree [2] This explains to a large extent the decision' not to move beyond the target for e fiscal deficit in 1993 94 It appears to ave become some sort of an economic law f democracies that with respect to public xpenditure, the tide never recedes In par cular, note something like a ratchet effect whereby budgeted expenditure on revenue ccount exceeds not just the amount bud eted in the previous year but also that which is actually incurred That this does ot extend to capital expenditure points to ow it is capital spending that takes a cut when fiscal adjustment is being attempted urther, what makes it difficult for the argu ent that the figure for the fiscal deficit in 993-94 being much higher than originally argeted reflects a Keynesian strategy is that while barely a fourth of the overshooting of tal expenditure is on capital account more an a quarter of this is due to capital expen iture on 'Defence' [3]

ource *Budget at a Glance* The Union Budget for 1994 95 Budget Division Ministry of Finance

It would be naive to assume governments in democracies choose the optimal level of the fiscal deficit with some technocratic elan Budget making is hardly a simple accounting exercise More like the government's borrowing requirement, or the fiscal deficit emerges as the out come of a bargaining process which re sults in financial allocations according to the relative strength of the protagonists So rather than the target for the fiscal deficit having been deliberately raised, it is more like the government having finally abandoned its project of lowering it to 4 per cent of GNP while the fund programme was on No doubt, the government s economists must have been quick to grasp that the economic condi tions were not entirely unfavourable to its resorting to this course

Nevertheless the decision to put a brake on fiscal contraction is only part of the strategy to revive the non agricultural sec tor of the economy Some more direct weapons have been adopted in the budget and I turn now to the efficacy of these

II
Logic of Budget: Desperately Seeking 'Dhan-Asthra'

The key to understanding the slow growth of industry ever since the reform process started is the lack lustre invest ment performance of the private sector Of course the current year has also wit nessed a higher value of capital goods imports over 1992 93 However I stick to arguing that the slow growth of demand for domestically produced capital goods really stems from a low level of investment because the (dollar denominated) expenditure on capital goods imports into the economy is yet to reach the levels attained in the year 1990-91 Hence the belief that the slow growth of the capital-goods sector is due to imports swamping domestic production following upon the lowering of tariffs cannot be sustained On the other hand we are yet to find evidence[4] that the level of private investment in the economy has regained the level attained in 1990 91 Of course the figures on private investment in the current year are not available However, we need not feel unduly handicapped by the absence of data on current investment The time lag be tween orders and deliveries can quite easily account for the current year's level of capital goods production in terms of the generally low level of private investment in the two previous years

Since industry is in recession an instrument to bring about its revival is needed Since it is the capital-goods sector that is affected a rise in investment expenditure should, in one stroke, revive this segment of the industrial economy However, government has actually reduced capital outlay (Budget Estimates for 1994-95 over the Revised Estimates for 1993-94), so there can be no question of a public investment led revival of industrial growth from this source Surely the government is aware of this Hence the 'package for industry' This package has four components a reduction of the rate of interest, a lowering of the rate of corporate tax, the extension of modvat to the capital-goods sector, and the lowering of tariffs on intermediate goods imports The tariff structure had, in certain instances, contributed to imported capital goods costing less than domestically produced ones While the last of these measures will undoubtedly help make domestic capital-goods production more competitive the expansion of capital-goods imports during 1993-94 is not, as I have argued earlier the problem Both imports of capital goods and private investment are yet to regain the levels of 1990 91 Viewed over a longer perspective therefore the slow growth of the capital goods sector is more than just a matter of imports replacing domestic production

The extension of 'Modvat' to capital goods production also constitutes, along with the reduction of customs duty on intermediates a profound change on the supply side, both designed to make production more profitable My contention is that neither of these measures is likely to make much of a difference to whether we will see a revival of investment What of the rest of the 'package for industry'? Of these the lower corporate tax rate will work to raise post-tax profits which will most likely result in higher dividends Whether all profits are saved and whether savings are automatically invested is of course an age old question in the eco nomics of growth Nor can the tax cut be expected to have an impact on the output decision of profit-maximising firms So the direct effects on investment and output/employment of the reduction in the corporate tax are unclear On the other hand the rate of interest is, in theory, conventionally considered to be a determinant of private investment Experience tells a different story though In fact, we are by now aware that the single most crucial determinant of private investment in the Indian economy is the extent of capital formation in the public sector The reasons are obvious, for 'crowding in' is more like what describes the relationship between public and private investment in most economies

But what, in the absence of more public investment, we might ask, could the finance minister have done towards bringing about a rise in private investment? He

could have introduced a time-bound tax rebate on current investment. Being temporary in nature it may be expected to provide an incentive for firms to act now. Since timing is of the essence here, that is, if we require private firms to go in for investment right now, a time-bound scheme is precisely what is needed. Moreover, if the corporate tax were left at its original level, the revenue implications of such a move need not have been adverse. The role of any temporary scheme would be to bring forward a potential economic decision. In the context of private investment decision-making this is often vital, as is, for instance now. It is possible to characterise the current slack in private investment as a decision to wait on the part of firms. Since investment decisions are irreversible, waiting is often optimal when there is uncertainty both as regards future policy and the effects of both current and future policy on the economy. Such uncertainty is pervasive under conditions of macro-economic stabilisation and structural adjustment. It is in altering the adverse incentive structure that builds up during such phases that a temporary tax rebate on addition to plant and machinery helps revive private investment. What is on view in India currently is a hapless government waiting for private investment to raise the rate of growth of industry and a private sector waiting for the government to get the economy to revive before committing itself to plans for expansion of capacity.

What emerges from all this is that the budget's contribution to a revival of private investment cannot be great. To repeat, the allocation for capital expenditure in 1994-95 is actually lower than that in 1993-94, and the latter was itself a year of low growth of industry, despite a ballooning deficit. Does this mean that deficits do not stimulate output growth? The answer is that the nature of expenditure is important. The public-investment multiplier, apparently, is higher than the public-expenditure multiplier. This is the lesson to be learnt from the experience of the year now drawing to a close. The budget has pumped-in demand alright, but it has not laid the foundations of a revival. As far as industrial performance is concerned, capital spending by government is the key, and the CSO's estimates point to slower Gross Fixed Capital Formation in the public sector since July 1991.[5]

POLITICS OF PUBLIC INVESTMENT

Perhaps it is instructive to ask why the government is cutting on capital expenditure at such a crucial juncture. It is apparent that the politics of budget-taking has overtaken the government. We know from the experience of developing economies undergoing macro-economic stabilisation that capital expenditure is the first category of expenditure to be cut when a reduction in the fiscal deficit is being attempted. After all, future generations, who are the principal beneficiaries of capital spending but have no political representation, can safely be ignored unlike, for instance, the raucous claims for higher procurement prices (immediately reflected in higher food subsidies). This constitutes the inherent attractiveness of current over capital expenditure for governments. In the vociferousness of its lobbies claiming increasing outlays on their own economic constituencies while at the same time crying for a lower tax-rate, India is fast approaching the status of a Latin American republic.

III
Concluding Remarks

In this brief essay I have focused only on some aspects of the union budget for the coming year. But I do believe that I have captured its essence. For while I am aware that the indirect-tax proposals are believed to go a long way towards radically reforming a parasitical administration structure, the thrust of the budget, as I see it, is towards the demand side of the economy. I have outlined the ways the budget attempts to stimulate demand and discussed the likely consequences. All in all, while there might still be growth in the industrial sector next year, I do not see the budget contributing to it in any obvious way. For the reason of wanting to stick to the main argument I also do not elaborate upon the observation that for the first time since Manmohan Singh the financial foundations of the union budget appear distinctly shaky. This budget is shaky on resource mobilisation, an instance being one where we are not told how the FM expects to recoup the Rs 4,000 crore that he expects to be the revenue loss due to the lowering of excise and customs duties. Apparently, what is expected to be lost on account of lower rates is expected to be recouped via higher collections. This requires a certain optimism about growth which, as I hope I have been able to show, might not be warranted by the circumstances.

But there is much to learn from the proposals for the year ahead and the government's accounts for the still current one about policy-making in India. Even while one might be excused for relishing the discomfiture of a government, that had only yesterday displayed much hubris, now having to rationalise the deluge of expenditure as 'countercyclical fiscal policy', one cannot but be alarmed by the realisation that the governmen performance in 1994-95 must leave o pessimistic of the prospects for a sou public finance in the near future. After a what does one concludes when the targ on three out of four definitions of t deficit is exceeded by over 100 per ce with the overshooting of capital-expen ture targets being far lower than that revenue account? That, the rhetoric asic the government is not committed to fisc correction whatsoever. That no attem been made to eliminate the revenue de cit, which means that we continue to bc row to finance consumption expenditu That our internal debt is rising,[6] only maintain a corrupt and inefficient sta apparatus. And, above all, that while economists are, at least to a limited exte right in being concerned with questions ownership, we are nowhere near havi resolved the fundamental issue in Ind today, that of governing this democrac Observing the recent management of t fiscal affairs of this country, even one wh has resolutely opposed conservative pu lic finance with its singleminded obse sion with public expenditure, and, in tur has often argued for activist governme can only say "this is not what I had mea at all!"

Notes

1 I have elsewhere argued that the princip cause for the improved price situation sin 1992 is the improved performance of agricu ture, in particular of foodgrains productio See my 'The Rationale and the Result of th Current Stabilisation Programme', Workin Paper no 253, Centre for Development Stu ies, Thiruvananthapuram, November 199 However, proceeding along similar lines, th prospect for 1994-95 may not be so rosy wi agricultural production for the current ye estimated to have been negative Econome ric evidence suggests the existence of lags i the working out of the effects of agricultur growth on industrial output and the inflatio rate

4 There is no data yet for the current year. Th CSO's quick estimates for the past three yea are reproduced in the most recent *Econom Survey*.

5 See *Economic Survey 1993-94*, Table 1 2. is interesting to note that the discussion in th *Survey* is conducted entirely in terms of th figures for Gross Domestic Capital Form tion which, since it includes stocks, turns an increase, entirely belying the slow-dow in investment Gross Fixed Capital Form tion in the public sector during 1992-93 estimated to be negative I am indebted Jayati Ghosh for this observation

6 In fact, it is now growing at a rate faster tha before the stabilisation programme com menced in July 1991 See *Receipts Budge* Ministry of Finance, 1994

Budget 1994-95: Fiscal Aspects and the Real Economy

V M Dandekar

It is to the credit of the present finance minister that, even as a member of a minority government, he decided to face the facts, accept the inevitable and venture to bring back the economy to normalcy by a twin strategy of fiscal discipline and structural reform. Quite understandably, the finance minister thinks that his strategy has been vindicated and, naturally, has persisted and pursued the same path in the budget for 1994-95. Therefore, it is only fair that we should judge the policy and hence the budget not on grounds of ideology but on performance.

BUDGET 1994-95 is the fourth successive budget by one and the same finance minister; we understand that this is a record in the fiscal history of independent India. This is all the more remarkable because, when the present finance minister took office in June 1991, the economy was in the throes of an unprecedented balance of payments crisis, international confidence had collapsed, and inflation was on the rise. The rising fiscal deficits of the central government were the root cause of the balance of payments problem, rising prices, and high rates of interest. This was a legacy of the policy pursued over the past four decades, the essence of which was a populist concern for the small, the poor, the weak, and the backward, the one lagging behind; in short, the one who would not survive the competition in the market place. He must be helped and protected. This was admirable. Unfortunately, this was matched by an anti-market bias, an irrational animus against the strong, the one who would survive the competition and would grow without social assistance because, in that case, he must be robbing the poor and exploiting the weak. Therefore, even if it might not be possible to help the poor and the weak positively and adequately, it was supposed to help the poor and the weak if the strong was constrained and his growth contained. This is the policy syndrome called 'Growth with Social Justice' with greater emphasis on Social Justice than on Growth. In the process, all elements of growth were crippled and all motivation for standing on one's own made redundant. As a result, growth suffered and, in consequence, also social justice. The economy did not produce enough to help those who must be helped. Three successive short-lived finance ministers, unwilling or hesitant to come out of this syndrome, looked on helplessly and allowed the situation to deteriorate further. It is to the credit of the present finance minister that, even as a member of a minority government, he decided to face the facts, accept the inevitable and venture to bring back the economy to normalcy by a twin strategy of fiscal discipline and structural reform. Quite understandably, the finance minister thinks that his policy has been vindicated and, naturally, has persisted and pursued the same path in the budget for 1994-95. Therefore, it is only fair that we should judge the policy and hence the budget not on grounds of ideology but on performance.

Before we comment on the budget for 1994-95, it may be useful to examine the performance, rather the credibility, of the budget for the last year (1993-94). The most glaring failure of the last year (1993-94) is the lapse in fiscal discipline as reflected in the fiscal deficit. It was Rs 40,173 crore in 1992-93; the budget for 1993-94 expected to bring it down to Rs 36,959 crore but ended up with a figure of Rs 58,551 crore (RE) which is 58.42 per cent more than what was budgeted. To judge whether this is a failure of the finance minister, his government, or of the entire polity and economy, one needs to look into the fiscal deficit in greater detail.

Lapse in Fiscal Discipline

Fiscal deficit consists of budgetary deficit + borrowings and other liabilities; or briefly fiscal deficit = budgetary deficit + borrowings. Though, this is how it has come to be presented and discussed, it will help clarify the issues, if we present it as: fiscal deficit = revenue deficit + deficit on capital account (other than borrowing). The 1993-94 budget estimates and the revised estimates are as shown in Table 1.

Thus, the large increase in fiscal deficit was mainly due to an increase in the revenue deficit; the revenue deficit almost doubled. Either, the revenue receipts were overestimated or, because of political reasons, the revenue expenditure could not be limited.

We shall first consider the revenue expenditure. We may divide the revenue expenditure into its three main components: revenue expenditure = interest payments + other non-plan revenue expenditure + plan revenue expenditure. The 1993-94 budget estimates and revised estimates are as shown in Table 2.

Thus, the revised estimate (RE) of total revenue expenditure exceeded the budget estimate (BE) by 8.2 per cent which is about the same as the estimated increase in the wholesale or consumer price index over the year. Actually, there was a small shortfall in the interest payments. But the division between the plan and non-plan revenue expenditure is not very satisfactory. The plan revenue expenditure increased by 10 per cent but the non-plan revenue expenditure increased by 16.9 per cent. Evidently, there is a failure to limit the non-plan revenue expenditure within the budgeted limit.

Shortfall in Tax Receipts

Let us next consider the tax and non-tax revenue receipts. The non-tax receipts are more or less what they were estimated in the budget: Rs 21,470 crore (BE) and Rs 21,693 crore (RE). But, there is a large shortfall in the tax receipts (net to centre): Rs 62,739 crore (BE) and Rs 54,473 crore (RE) which amounts to a shortfall of 13.2 per cent. If we allow for the annual inflation of 8.2 per cent, the shortfall in tax revenues works to almost 20 per cent (19.76 per cent to be exact). This should be a matter of serious concern and deserves careful examination.

A cornerstone of the New Economic Policy is that if you reduce taxation, that is, tax rates, it gives a fillip to the economy so much so that what you lose because of reduction in tax rates, you more than make up because of increased production and income. For instance, in 1993-94, reduction in direct taxes was estimated to cause a loss of Rs 106 crore to the centre's revenue (Finance Minister's Budget Speech, 1993 Part-B, para 80) and reduction in indirect taxes (customs and excise duties) a loss of Rs 3,981 crore to the centre's revenue (ibid para 134). Thus, there was a total revenue loss of Rs 4,087 crore to the centre's revenue in 1993-94. It means that, prices, production and incomes remaining the same, the tax

Table 1

(Rs crore)

	Fiscal Deficit	Revenue Deficit	Deficit on Capital Account (other than borrowing)
1993-94 (BE)	36,959	17,630	19,329
1993-94 (RE)	58,551	34,058	24,493
RE-BE	21,592	16,428	5,164

revenue receipts in 1993-94 would be lower by Rs 4,087 crore than in the previous year (1992-93). The actual tax revenue receipts in 1992-93 were Rs 54,044 crore so that, prices, production and incomes remaining the same, the tax revenue receipts in 1993-94 would be estimated at Rs 49,957 crore, or allowing a price rise of 8.2 per cent, Rs 54,053 crore. In fact, they were estimated at Rs 62,739 crore, which is 16.1 per cent higher, hoping that the reduced taxation would raise production and incomes.

The two main sectors which may be expected to get a fillip by a reduction of taxes are (i) manufacturing, construction, electricity, gas and water supply, and (ii) transport, communication, and trade. In 1992-93, the gross domestic product (GDP) from these sectors is estimated (quick estimates) at Rs 1,00,391 crore at 1980-81 prices (*Economic Survey 1993-94*, Table 1.3). To meet the budget estimate of tax revenue receipts of Rs 62,739 crore, it would require these sectors to grow at 16.1 per cent during 1993-94. Of course, they did not and the tax revenue receipts amounted to only Rs 54,473 crore (RE), a little more than what we have estimated above, namely, Rs 54,053 crore which is just 2.28 per cent more.

Last year, did the finance minister really expect the above-mentioned two sectors to show an increase of 16.1 per cent? Evidently he did and he shows his disappointment but blames it all on the capital goods sector. "The slow growth of industry in 1993-94 is a matter of concern and is largely due to sluggishness of the capital goods sector. If capital goods are excluded, the rest of the manufacturing sector shows 6 per cent growth in the second quarter and is expected to improve in the rest of the year" (Finance Minister's Budget Speech, 1994, Part-A, para 5). May be it will. But, it will still be a far cry from the two sectors mentioned above showing an annual growth of 17.8 per cent. Without attributing motives, one must conclude that the finance minister was either too confident of his policy, or under pressure not to allow the fiscal deficit to exceed what it was in 1991-92 (Rs 36,325 crore) or what appeared in the revised estimates for 1992-93 (Rs 36,722 crore) and he allowed himself to overestimate the tax revenue receipts.

It is a matter of concern that, nevertheless, the finance minister exudes confidence more befitting a politician and, in the 1994-95 budget, persists in making further tax concessions, causing a loss of Rs 3,604 crore in centre's tax revenue (Finance Minister's Budget Speech, 1994, Part-B, para 122). It means that prices, production and incomes remaining the same, the tax receipts in 1994-95, will be lower by Rs 3,604 crore compared to the receipts in 1993-94, namely, Rs 54,473 crore (RE), that is Rs 50,869 crore; or allowing a price rise of 8.2 per cent as in the last year, the tax receipts in 1994-95 may be estimated at Rs 55,040 crore. Instead, the finance minister has estimated them to be Rs 62,742 crore which is 13.99 per cent more. To meet this estimate, the above-mentioned two sectors must grow by 13.99 per cent during 1994-95. In spite of the experience of the last year, the finance minister seems confident. "The recession in the capital goods industries is primarily because investment activity slowed down temporarily as firms adjusted their investment plans to the new situation. There are signs that this restructuring process is well advanced and many companies are now launching major programmes to enhance their international competitiveness. The turnaround in investment is, therefore, beginning" (ibid, para 5). We hope he is right.

Nevertheless, it seems that to expect a growth of 13.99 per cent in the two sectors mentioned above, the finance minister is putting too much at stake or, as it is now being officially described, he is taking a calculated risk. One wonders whether he is doing this out of conviction or under pressure to keep the fiscal deficit as low as possible. This is understandable. Unfortunately, it does not work. Last year (1993-94), he tried to hold the fiscal deficit at Rs 36,959 crore (BE) and ended up with Rs 58,551 crore (RE); we have yet to see the actuals. Inevitably, most of the increase in the fiscal deficit, amounting to Rs 21,592 crore, has to be met by market borrowing including some from the Reserve Bank in one form or another and/or external borrowing.

Close to Debt-Trap

All market borrowing (net of repayments), whether internal (which is mostly from the captive market of commercial banks, Life Insurance Corporation, Provident Funds, etc, the balance being subscribed by the Reserve Bank) or external, adds to the liabilities of the central government and hence the burden of interest. Because of the huge liabilities the government has accumulated over the years, the burden of interest has now become unbearable. According to the budget estimates for 1993-94, 45.13 per cent of the revenue receipts were to go into interest payments. But because of shortfall in revenue receipts, the revised estimates show that 49.23 per cent, that is, almost half of the revenue receipts went into interest payments. The actuals may show a higher percentage of revenue receipts going into interest payments. The budget for 1994-95, has set aside 53 44 per cent of the estimated revenue receipts for payment of interest. If the estimated tax revenues fail to materialise, as they did last year, the percentage will be higher and may reach even 60 per cent.

If we relate interest payments to the net new borrowings, we may realise how close we are to entering into a debt trap. In 1993-94 (BE), interest payments (Rs 38,000 crore) actually exceeded the net new borrowings (Rs 32,645 crore). In other words, the entire net new borrowings and much more went into interest payments. This is characteristic of a debt trap, namely, that one has to borrow even to pay interest leaving little possibility of ever repaying the principal. In 1993-94, we escaped the debt trap because of a shortfall in the tax revenue receipts and consequent larger borrowings, namely, Rs 49,491 crore (RE) while the interest payments were a little lower than estimated, namely, Rs 37,500 crore, constituting 75.77 per cent of the net new borrowing. This means that 75.77 per cent of the net new borrowing was spent on interest payments and the balance in meeting a part (about one-third) of the revenue deficit. But, obviously, one cannot postpone the debt-trap by this route; it will show up each year. For instance, next year, that is, in 1994-95, the net new borrowings are estimated at Rs 48,915 crore (BE) and interest payments at Rs 46,000 crore (BE) which is 94.04 per cent of the former. Thus, we shall be uncomfortably close to the debt-trap unless we repeat the unhappy performance of 1993-94, namely, falling short in tax revenue receipts and hence borrowing more than budgeted.

Continued net new borrowing adds to the liabilities of the government of India and one may relate them to GDP. Incidentally, we may mention that the liabilities consist of internal and external liabilities and in combining the two, the latter should be converted into rupees, not at the historical exchange rates but at the exchange rate current at the end of the year. In relating the total liabilities to the GDP, the latter figure is of course the more relevant. However, in the Receipts Budget, in the Statement of Liabilities, the external debt is valued at the historical exchange rates (Receipts Budget, 1994-95, p 42) and it will need to be converted to the current exchange rates. Fortunately, the *Economic Survey* gives both the figures, namely, the external debt valued at

Table 2

(Rs crore)

	Revenue Expenditure	Interest Payments	Other Non-Plan Revenue Expenditure	Plan Revenue Expenditure
1993-94 (BE)	1,01,839	38,000	39,654	24,185
1993-94 (RE)	1,10,224	37,500	46,370	26,354
RE-BE	8,385	-500	6,716	2,169

historical exchange rates and also at the exchange rate current at the end of the year (*Economic Survey 1993-94*, Table 2.5, p 22). We shall begin with 1991-92 because the figures in the *Economic Survey* for 1991-92 are actuals. The ratio between the external debt valued at historical exchange rates and at the current exchange rate at the end of 1991-92, when the rupee was already devalued, is 2.97. For later years, as an approximation, we propose to use this ratio to convert external debt given in the Receipts Budget, where it is valued at historical exchange rates, to current exchange rate (Table 3).

Thus, in 1991-92 and 1992-93, the total liabilities of the central government constituted about 77 per cent of the GDP. For 1993-94, we have only the revised estimate of liabilities and they amount to Rs 5,62,026 crore. The advance estimate of GDP in 1993-94, (at 1980-81 prices) is Rs 2,30,400 crore showing an increase of 3.74 per cent over the previous year (*Economic Survey 1993-94*, Table 1.1, p 2). On the other hand, total outstanding liabilities in 1993-94 (RE), as estimated above, are 15.91 per cent higher than in the previous year. Even if we allow a price increase of 8.2 per cent, the liabilities at the end of 1993-94 will be 7.12 per cent higher than at the end of 1992-93, probably by 3.26 per cent, that is, almost 83 per cent of the estimated GDP.

Moreover, if net new borrowing is used mostly to pay interest on outstanding debt and partly to meet the revenue deficit, in other words, without creating matching assets, the assets and liabilities do not match and the gap between the two widens (Table 4). For instance, in 1991-92, the total assets of the government of India were Rs 2,61,478 crore while the outstanding liabilities amounted to Rs 4,27,160 crore (*Economic Survey 1993-94*, Table 2.5, p 22) leaving 38.79 per cent of the liabilities uncovered by any assets. In 1992-93, the outstanding liabilities amount to Rs 4,84,894 crore while the assets amount to Rs 2,90,963 crore leaving 39.99 per cent of the liabilities uncovered by any assets. The outstanding liabilities at the end of 1993-94 (RE) amount to Rs 5,62,026 crore while the assets amount to only Rs 3,26,854 crore leaving 41.85 per cent of the liabilities uncovered by any assets. Of course, we have yet to see the actuals. But, clearly, the gap between assets and liability of the government of India has been slowly growing over the years and as at present at least 40 per cent of the liabilities remain uncovered by any assets.

In 1994-95 (BE), the liabilities amount to Rs 6,30,284 crore and the assets to Rs 3,55,536 crore leaving 43.59 per cent of the liabilities uncovered by any assets. Thus, in respect of the gap between assets and liabilities, the budget 1994-95 maintains the trend of the past three years; whether it does better than that, we shall know next year when we have the revised estimates and after another year, that is, in the budget for 1996-97, when we have the actuals for 1994-95. The finance minister does not have to worry. As he said in his budget speech last year (1993-94), the "finance ministers have to look after the short term if they want to survive in the medium term" (Budget Speech, 1993-94, Part-A, p 18). Now that he has survived in the medium term, he may look forward to surviving in the long term hopefully beyond the next general election.

The finance minister is aware of the burden of interest payments and hence the paramount need to reduce further borrowing and, if possible, to start net repayment of the outstanding debt. For this purpose, he has proposed, what he calls, "A bold programme for disinvestment of government equity in public enterprises and earmarking a part of the sale proceeds purely for debt reduction" (Budget Speech, 1994-95, Part-A, p 16). It is an irony of the situation that the finance minister has to call, even such a straightforward proposition, 'a bold programme' and has to present it apologetically by saying that only a part of the sale proceeds would be earmarked purely for debt reduction. He is obliged to do this because he has to face a Lok Sabha most members of which, including members of his own party, are essentially illiterate in matters of public finance. The straightforward proposition is that when assets built by borrowing do not pay even the interest on debt, they must be sold and the debt repaid. Housewives understand this better than most politicians.

PSU Disinvestment

Disinvestment of a part of the government holdings in the share capital of selected PSUs was envisaged in the Industrial Policy Statement announced in July 1991. During 1991-92, disinvestment was done in two phases in December 1991 and February 1992. The 31 companies whose shares were selected for disinvestment were a mix of eight very good, 12 good, and 11 not so good companies defined as those with net asset value (NAV) of Rs 10 share exceeding Rs 50, between Rs 20-50, and less than Rs 20, respectively. The shares were offered in bundles consisting of nine PSUs as randomly structured portfolios each with a notional reserve price being an average of NAV and profit-earning capacity value (PECV). The shares were offered to selected financial institutions and mutual funds.

In the first phase of disinvestment, in December 1991, shares of face value of Rs 516.2 crore realised Rs 1,427.3 crore (2.765 times). In the second phase, in February 1992, shares of face value of Rs 355.9 crore realised Rs 1,610 4 crore (4.525 times). Thus, during 1991-92, PSU shares of face value of Rs 872.1 crore were disinvested to fetch Rs 3,037.7 crore. These are duly shown as other capital receipt (*Budget at a Glance, 1993-94*, p 1). These constituted 8 per cent of the government holdings in the 31 PSUs selected for disinvestment (*Economic Survey 1992-93*, paras 6.79, 6.80, p 149]. This implies that, at the end of 1991-92, the total equity holding of the central government in the 31 PSUs selected for disinvestment was

Table 4

Year (1)	Total Liabilities as Estimated Above (Rs Crore) (2)	Total Assets (Rs Crore) (3)	Assets as Per Cent of Liabilities (4)
1991-92	4,27,460	2,61,478	61.17
1992-93	4,84,894	2,90,963	60 01
1993-94(RE)	5,62,026	3,26,854	58 16
1994-95(BE)	6,30,284	3,55,536	56.41

Notes: Liabilities are as estimated above, that is, with external debt valued at current exchange rate. Assets are taken from the Statements of Assets given in the Receipts Budget, 1994-95, p 43.

Table 3

Year (1)	Internal Liabilities (Rs Crore) (2)	External Debt Valued at Historical Exchange Rates (Rs Crore) (3)	External Debt Valued at Current Exchange Rates (Rs Crore) (4)	Total Liabilities (2+4) Exchange (Rs Crore) (5)	Gross Domestic Product (Rs Crore) (6)	Liabilities as Per Cent of GDP (4)/(5)x100 (7)
1991-92	3,17,714	36,948	1,09,746	4,27,460	5,51,600(P)	77.49
1992-93	3,59,355	42,269	1,25,539	4,84,894	6,27,900(Q)	77.22
1993-94(RE)	4,25,727	45,892	1,36,299	5,62,026		
1994-95(BE)	4,83,245	49,508	1,47,039	6,30,284		

Notes: For 1991-92, external debt valued at both historical and current exchange rates are taken from *Economic Survey 1993-94*, Table 2.5, p22, the ratio between the two being 2.97. For 1992-93, 1993-94 (RE), and 1994-95 (BE), the external debt valued at historical exchange rates are taken from the Receipts Budget, 1994-95, p 42, and converted into the same at current exchange rate by using the ratio 2 97.

Estimates of GDP 1991-92 and 1992-93 are taken from *Economic Survey 1993-94*, Table 1.1, p 2; (P) means provisional estimate; (Q) means quick estimate.

about Rs. 10,900 crore. Though these include State Trading Corporation (*Economic Survey 1992-93*, 6.20 p 151), they are mostly production enterprises. Presumably, the government will consider disinvesting its equity in at least its production enterprises which numbered 165 and share capital of the central government which amounted to Rs 39,785 crore as on March 31, 1992 (*Public Enterprises Survey 1991-92*, Vol 1, Statement 1B, p S-2).

During 1992-93, the shares were unbundled and were made open to the public and other institutions. The reserve price was fixed as an average of the price recommended by three merchant bankers. In October 1992, shares worth (face value) Rs 128.7 crore were sold for Rs 681.95 crore (5.299 times) and, again, in December 1992, shares worth Rs. 310.6 crore were sold for Rs 1,183.83 crore (3.811 times). Thus, during 1992-93, a total of Rs 1,865.78 crore were realised by disinvestment in PSUs. The actual (other) capital receipts in 1992-93 are shown to be Rs 1,961 crore and presumably include some small capital receipts other than from disinvestment in PSUs. Evidently, in the first three biddings, namely, in December 1991, in February 1992, and in October 1992, the price realised progressively increased from 2.765 times to 4.525 times to 5.299 times. But, in the last bidding, namely, in December 1992, the realisation came down to 3.811 times in spite of the fact that the shares were not offered in composite bundles of very good, good, and not so good PSUs. Obviously, the private sector is showing less interest in owning only a small part of the equity of the PSUs while leaving the management with the government.

The actual receipts from the disinvestment in PSUs both in 1991-92 and 1992-93, the estimated receipts of Rs 2,500 crore in 1993-94 (RE), and the Rs 4,000 crore in 1994-95 (BE) are only a fraction, less than 10 per cent of the revenue deficit and are being used to meet this deficit. There is clearly a long way to go in budget management before the disinvestment in the PSUs may be used, even partly, for repayment of public debt.

The total public debt of the central government is estimated to amount to Rs 3,27,066 crore (Rs 2,77,561 crore internal + Rs 49,508 external valued at historical exchange rates). If the external debt is valued at current exchange rate, the total public debt of the central government, at the end of 1994-95, would amount to Rs 424,600 crore. This is almost eight times the equity in the production PSUs, namely, Rs 39,785 crore as mentioned above. In other words, to be able to liquidate its public debt by disinvestment of its equity in the production PSUs, the government should be able to realise almost eight times the face value of the equity. This is not impossible. The assessment by the prospective investors is that, though many PSUs show losses while many others give only small returns, many PSUs have, besides expensive plant and machinery, land and buildings in prime areas, and that therefore, it is not impossible to recover eight to 10 times the equity by a judicious disinvestment. But these considerations can become operative only if the government would sell 100 per cent of its equity to a private entrepreneur so that, not just the equity, but the entire management is handed over to the private entrepreneur with freedom to reduce the excess workers which the PSUs have tended to accumulate. This is politically not possible because of the resistance from the workers. At the end 1991-92, the workers employed in the PSUs numbered 21.84 lakh and their emoluments, during 1991-92, amounted to Rs 12,346 crore. The per capita emoluments work out to Rs 56,522. Over the two decades from 1971-72 to 1991-92, these have increased 8.55 times while the All India Consumer Price Index (1960 = 100) increased only 4.62 times. It means that, over this period, the real wages of the PSU workers multiplied 1.85 times (*Public Enterprises Survey*, 1991-92, Vol I, Table 13.3, p 166), while the per capita GDP increased by only 1.50 times (*National Income Statistics*, relevant issues).

Evidently, the government is helpless. The following is an eloquent commentary on the position of the government vis-a-vis the organised workers, not just in the PSUs, but workers in general: In 1991-92, out of the 237 PSUs, 102 were making losses. These include 15 large enterprises which are monopolies, such as the Food Corporation of India and the Indian Airlines, while the remaining ones function in a competitive environment. The monopolies account for about three-fourths of the capital employed and one-fourth of the accumulated losses while the competitive enterprises employing a quarter of the capital make three-quarters of the losses. Employment in the two groups is nearly equal. Among the loss-making enterprises, other than the 15 monopolies, about half constitute sick units taken over by the government and account for about three-fourths of the public sector enterprises. The loss per employee in these (presumably sick units taken over from the private sector) enterprises exceeds the average wage rate (*Economic Survey 1992-93*, p 146-47). What an enterprise! This is called 'protecting the interests of the workers'. One wonders as to who is protecting whose interests and at whose cost. *Economic Survey 1992-93* mentions that modalities for offering PSU shares to workers are being worked (p 151). *Economic Survey 1993-94* makes no mention of any progress along this line. The fact is that the economy is now facing a fundamentalist class which has a vested interest in the *status quo* no matter where it leads the economy to. If the ideological base of this fundamentalism is that the workers are exploited by the capitalist, the solution lies in the workers owning and managing the enterprise and not, as at present, the workers exploiting the rest of the society.

Gold Bond Scheme

So much for the possibility of disinvestment of equity in the PSUs and utilising the receipts, at least partly, for repaying the internal debt. To use them to repay external debt will require selling their equity to foreign investors. This is wellnigh impossible because of the fundamentalist position mentioned above. The finance minister has therefore introduced another scheme, namely, Gold Bond 1998, the purpose of which is to mobilise idle gold resources of ordinary citizens to supplement official reserve. Subscriptions are accepted in the form of gold and at the end of five years an equivalent quantity of gold will be returned to the subscriber plus an interest at 2 per cent per annum. The main problem with the gold resources of the common man is that they are not quite as 'idle' as are the official gold reserves; they are mostly in the form of ornaments which are partly used regularly and partly on occasion. The scheme requires that they are melted down for purposes of refining and assaying. The cost of remaking the ornaments is not negligible. The interest at 2 per cent per annum and the fact that they are tax-free does not help the common man very much. The real advantage is that no questions are asked as to the source of funds. Clearly the intention is to borrow black money, that is, tax evaded money, through the route of gold, partly legally imported but mostly smuggled. Of course, even if smuggled, it requires processing and assaying; but that is at the cost of the government.

It seems that the scheme has succeeded. The subscription was opened on March 15, 1993 and was to close on June 14, 1993, which date was extendable. In 1993-94 budget, the scheme was estimated to yield Rs 300 crore (BE) which was revised to Rs 375 crore (RE). In fact, the response has been better than expected. It is reported (*The Economic Times*, April 3, 1994) that during 1993-94, 41.12 tonnes of gold worth approximately Rs 1,800 crore was tendered though its processing and assaying in the mint in Bombay was taking time. One reason for the attraction of the Gold Bonds in the blackmarket is that, though no questions are asked as to the sources of funds, the bonds can be used as collateral in banks for loans. Moreover, they can be, and are being, traded at a discount. Reportedly (*The Economic Times*, April 3, 1994), at the beginning the discount rate was 20 per cent and has now dropped to 17 per cent indicating

that the demand for Gold Bonds is increasing because thereby one can convert black money into white. Indirectly, it encourages regular import or smuggling of gold. This would reduce the difference between the Indian and the International, that is, Bombay and London, price of gold. Reportedly (*The Economic Times*, April 3, 1994), this is already happening. One might therefore ask as to what is the equilibrium ratio between the Bombay and London prices of gold at which there will be little incentive for smuggling of gold. Apparently, it is one; that is, if the price of gold in Bombay and London is the same, there will be little incentive for importing or smuggling.

To simplify the argument, let us grant that, if the Bombay and London prices of gold are on par, the people concerned will prefer legal import of gold to smuggling, provided that the import duty on gold is low enough to more than compensate the risk involved in smuggling, and provided, of course, government would permit unlimited import of gold. Under these conditions, gold would be imported as a consumer good, as raw material for making gold ornaments and jewellery for the domestic market and hopefully also for export. The essential point is that, if Bombay and London prices of gold are on par, there will be no incentive to import gold except as raw material for the above mentioned purposes.

But, not quite if the Gold Bond remains a continuing scheme so that imported gold may be used, not just for making gold ornaments and jewellery, but also for buying Gold Bonds. Evidently, it will continue in 1994-95 and is estimated to yield Rs 1,225 crore. In fact, S Venkitaramanan, the then governor of the Reserve Bank of India, had said: "The government has also announced setting up an institutional mechanism in the form of a Gold Bank... The success of such a Gold Bank will depend to a large extent on the ease of access, the quickness with which gold is assayed and converted to gold certificates, development of a reliable secondary market in gold bonds and availability of financing facilities against them. Another related matter is the extent of tax concessions and immunities which Gold Bonds are accorded by the government" (*Reserve Bank of India Bulletin*, August 1992, p 1,308). As mentioned above, the refining and assaying of gold and consequent issue of bonds is not as quick as the governor would want it; but, hopefully, this will improve. A secondary market is already developing and the bonds are being traded. Financing facilities are available against them; the bonds can be used as collateral in banks for loans. The bonds are tax-exempt which presumably include both the interest income and the capital gains. Finally, the bonds are given maximum immunity because no questions are asked as to the sources of funds. Thus, all the requirements which the ex-governor of the Reserve Bank desired are satisfied.

But, the ex-governor of the Reserve Bank had also cautioned that "if the immunities and incentives are too large, then the Gold Bond scheme may become the pathway to a vicious cycle of movement of funds out of the country through the grey market and back as gold" (*Reserve Bank of India Bulletin*, August 1992, p 1,308). Let us see what he means.

It is admitted by all, including the finance minister, that, in India, there prevails a parallel economy which operates with black, that is tax-evaded, money variously estimated between 20 and 40 per cent of the white economy. Its operations not only do not enter the official estimates of GDP or even the invisible items of balance of payments, but have proved to be immune to all fiscal measures. One of its areas of operation is what probably the ex-governor of the Reserve Bank calls the grey market. In this market, the black money buys foreign exchange, smuggles it out, buys gold, and smuggles it in. The incentive is the difference in price of gold in London and in Bombay. Hence, if this difference is reduced, there should be so much less incentive for smuggling. But what if "the immunities and incentives are too large" and are they large? An interest at 2 per cent per annum and a hedge against a possible rise in gold are minor incentives for the people concerned. Immunity is the assurance that no questions will be asked as to the sources of funds and it cannot be improved upon. It means that one might evade taxes, and use the tax-evaded money for "the movement of funds out of the country through the grey market and back as gold" to invest in the Gold Bonds as a laundry. This is the essence of the scheme so that the holder of black money may be willing to pay even a premium on imported or smuggled gold, buy Gold Bonds and sell them at a discount. For instance, suppose that the average tax evasion on tax-evaded money is 40 per cent and that the discount rate on Gold Bonds is 20 per cent. Then one may evade taxes, buy smuggled gold at a premium of 25 per cent, invest it in Gold Bonds, sell the bonds at a discount of 20 per cent and still be better off. For instance, he may buy smuggled gold for Rs 100, the regular market price for which is Rs 80, buy Gold Bond worth Rs 80 and sell it at 20 per cent discount, that is, for Rs 64 and still be better off than paying Rs 40 in taxes. It is thus that Gold bonds will encourage both tax-evasion and smuggling of gold.

Why Not Gold-Linked Bonds?

We do not know whether the ex-governor of the Reserve Bank meant so much when he cautioned against the operations of the grey market because he also sounded an optimis- tic note: "In the longer term, however, [I] might mention that, once the certificate c[an] be used as a quasi gold, which can be eas[ily] converted into gold, the lure of holdi[ng] physical gold will diminish. It is expect[ed] that over time, as trust develops, individu[als] may be found using gold certificates or go[ld] bonds as hedges against inflation, just t[he] same as they now hold the stocks of go[ld]. Obviously, instruments such as gold bon[ds] cannot reduce the attraction of gold or[na]ments and gold jewellery. But they w[ill] certainly be able to reduce the primary li[ne] of holding gold as a hedge and as a specu[la]tive device" (*Reserve Bank of India Bulletin*, August 1992, p 1,308).

This is well taken. But, if Gold Bond c[an] be used as quasi-gold, so can another inst[ru]ment having the same property but [not] physically involving any gold. For the s[ake] of convenience and also to bring out [the] distinction, we may call such an instrum[ent] the Gold-linked bond. First, the subscr[ip]tion to these bonds will be, not in gold bu[t in] money, on a 'no questions asked' basis a[s in] the case of Gold Bonds. Second, these bon[ds] will have a period of only one year and [not] five years as in the case of the Gold Bon[d] 1998. Third, the maturity value of the bo[nd] will be linked to the price of gold in Bomb[ay] plus a small interest, say, at 2 per cent [per] annum. Such a gold-linked bond will p[er]form exactly the same function as the [ex-] governor of the Reserve Bank envisages [the] Gold Bond to perform. Besides, the go[ld-] linked bond has other advantages.

First, it does not require tendering of g[old] and hence does not involve refining [and] assaying which, besides cost, is time-co[n]suming. Second, it does not drain our f[or]eign exchange through the gray mark[et]. Third, because it does not require gold[,] [it] does not increase demand for gold; in f[act,] it creates quasi-gold and thus increases [the] supply of gold which may bring down [the] gold price at home. Fourth, because it w[ill] have a maturity of only one year, the gove[rn]ment will have an opportunity every yea[r to] revise the interest rate depending upon h[ow] the price of gold is behaving. Of course, [like] the Gold Bond, the Gold-linked Bond [will] also carry with it the 'immunity' and he[nce] will encourage tax-evasion. In fact, [any] instrument which immunises tax-evas[ion] necessarily encourages tax-evasion. [Over] time, as trust develops, that is, between [the] government and the tax-evaders, the pa[ral]lel economy will run parallel to the reg[ular] economy and, unlike in the Euclidean [ge]ometry where two parallels do not meet, [the] one may cross its path and overtake [the] regular economy.

So far, we have confined our rem[arks] mainly to the fiscal aspect of the budg[et] [as] these are what the budget is mainly ab[out]. We shall now turn to an aspect of the

economy, namely, the infrastructure, in particular roads. The reason to choose this particular item is, first, it is most used by the common man and, in spite of all the high technology communication, roads remain indispensable. Second, it offers the largest scope for employment of relatively unskilled workers in rural areas. First, let us see the broad facts regarding our road system and its condition.

Employment Potential of Roads

The total road network in the country was 20.4 lakh kms at the end of 1990-91, half of which was made up of unsurfaced roads. At the end of 1992-93, the national highways network of 3,400 kms constituted less than two per cent of the total network but carried nearly 40 per cent of the total traffic. It is estimated that the road traffic would be more than doubled during the 1990s. To meet the traffic expansion of such magnitude, the national highways network is in need of considerable improvement. A large section has inadequate road pavement and surface thickness. Other deficiencies are poor alignments, weak and narrow culverts and missing bridges. About 12 per cent of national highways need widening from single to double lanes. About 56 per cent of the two-lane roads have to be strengthened, and selected corridors on the national railways need conversion into express ways. This is clearly an enormous task and implies massive investment requirements. The National Highways Act has been amended enabling levy of a fee on selected sections of national highways so that the private sector may participate in construction, maintenance and operation of roads on Build, Operate, and Transfer (BOT) basis. However, a lack of legal framework governing such schemes has so far delayed progress (*Economic Survey 1993-94*, paras 78-80, p 141-42). Incidentally, we should note that, even if some roads may be built by private entrepreneurs on a BOT basis, they will have to be alternatives to the main road system so that there are no private monopolies in the roads. Hence, the construction and maintenance of the road system will have to be a public responsibility.

What is true of the national highways is also true of the state highways. The situation is worse in respect of major and other district roads and village roads. A rough cost estimate by the ministry of surface transport for the development of various categories of roads to meet the requirements of the projected traffic during the 1990s comes to Rs 67,000 crore (at 1987 price level) (Report of Steering Committee, Perspective Planning for Transport Development, Planning Commission, August 1988, para 14.24, p 153). Allowing a price rise of 1.77 between 1986-87 and 1992-93 (GDP deflator), the estimated cost comes to Rs 1,18,748 crore. Clearly, the relative neglect of the roads in the past will have to be made up by undertaking a massive programme of road construction and maintenance. The cost estimate is so high that there is no great point in updating it. Instead, we shall examine its employment potential and see how the programme may be phased over the next few years.

According to the National Transport Committee, 1980, one lakh rupees of investment in roads construction and maintenance provides direct and indirect employment of 15 and 12.5 person-years respectively, adding to a total of 27.5 person-years. In other words, an investment of Rs 3,636 provides employment to one person for a year (Transport Policy Committee, 1980, Planning Commission, Table 3.25, p 56). To allow for the rise in prices between 1980 and now, we may use the GDP deflator which for 1992-93 (at 1980-81 prices) is 2.833. Which means that an investment of about Rs 10,000 in the construction and maintenance of roads creates employment of one person-year. Another estimate of the cost of employing unskilled labour is available from the expenditure on Jawahar Rozgar Yojana. In 1992-93, it was Rs 2,546.21 crore (RE) (Expenditure Budget 1993-94, Vol 2, Demand No 69, p 159). This is estimated to have created employment of 78.21 crore person-days (*Economic Survey 1993-94*, Table 9.11, p 158). This works to Rs 32.56 per person-day or Rs 9,767 per person-year, taking 300 work days in a year, which is close enough to Rs 10,000 per person-year estimated above.

In the budget for 1994-95, there is a provision of Rs 3,855 crore, or say, Rs 4,000 crore for the Jawahar Rozgar Yojana. At the rate of Rs 10,000 per person-year, this should be able to provide full time (300 days a year) to 40,00,000 persons. In a programme of providing wage-employment, which is what a poor man needs, thinking must shift from person-days to persons. The intention so far has been to give to the surplus population, which agriculture cannot support, some succour but without withdrawing it from agriculture. What is needed is to withdraw a substantial proportion of the surplus population from out of current operations of cultivation and employ it on creation of an infrastructure needed for rural development; a well designed network of roads, national highways, state highways, major and other district roads, and village roads, is an important element of such an infrastructure. As mentioned above, the estimated cost of a network of such roads is Rs 1,18,748 crore, or say, Rs 1,20,000 crore (at 1993-94) prices. At Rs 4,000 crore per annum, this is a programme for 30 years and will employ 40,00,000 persons full time. That is the size of the problem both of providing adequate network of roads and of employment.

It may be said that Rs 10,000 per person-year is an underestimate. Possibly it is. Consider, for instance, employment in the central government. As on March 1, 1994, the employees of the central government numbered 39,49,407 and cost (salary and allowances) Rs 14,184 crore which works to Rs. 36,913 per employee (Expenditure Budget, 1994-95, Vol 1, Annexure-7, p 86). Adding something for implements, machinery and transport, let us suppose that the cost of road works per worker will be Rs 40,000 per annum. Even at this rate, the budget provision of Rs 4,000 crore can offer full time employment to a million persons. Hence, the problem of employment of rural poor for rural development is one of organisation rather than one of finance.

Land Army Concept

In the very First Five-Year Plan, the concept of a Land Army was mentioned but was not pursued. It is time we return to that concept. The most appropriate agency for organising rural poor for rural development appears to be a Land Army as a department of the ministry of defence officered by retired army personnel and deployed regionally. The workers in the Land Army should be willing to work anywhere in the country under army conditions. In particular, they will not have the right to strike. They can, of course, resign at will. The ministry of surface transport, in consultation with the state governments should prepare a master plan of roads development, with necessary regional dispersal and well determined priorities. The Land Army should execute the plan in phases. There should be no objections to mechanisation on grounds that it will reduce the employment potential of the programme. The aim should be to improve the skills and productivity of presently unskilled rural labour and create a large disciplined mobile labour force.

If the demand for this kind of employment exceeds the budget provision, it should be enhanced by gradually reducing the food and fertiliser subsidies. Fertiliser subsidies and support prices for agricultural products do not make non-viable agriculture, viable. Also, the distribution of essential commodities through the fair price shops remains not well targeted. Those who join the Land Army are self-selected poorest of the poor. What they need is not subsidised food but a minimum purchasing power; in other words, what they need is a support price for their labour.

It is not fair to expect the finance minister to propose and initiate such programmes. But, now that he has moved into the inner circle of the ruling political party, it would not be unfair to expect him to take a lead in this matter. Otherwise, the new economic policy will remain confined to trade, industry, and finance.

To all our guests, patrons and well wishers
This Trophy belongs to you
We are mere recipients
A grateful thanks to all those who made the International Touristic Promotion award (Madrid) 1994 a reality for us.
That's the way it has been right from our 1st OASME award for Best Hotel in 1986, Followed by the 1988, 1989 OASME award. Then the International Gold star award for quality in 1992.
Come. Together we'll head for even greater heights in the future.

Tax Reforms for Textile Sector

Mahesh C Purohit

The budget follows the policy of high fiscal deficit to boost the economy. It may be worth the risk provided the supply side responds adequately. The budget has based this assertion on the claim that it has taken a leap forward towards a rational tax policy: This paper challenges this claim and presents an analysis of reforms in the union excise duties for textile sector as a case study. It delves into the priorities as well as the pace of reforms. The paper puts forth proposals for reforms essential to provide an environment conducive to a proper response from the supply side.

THE budget 1994-95 has been presented at a time when the economy is facing low growth. The GNP in 1993-94 increased by 3.8 per cent and industrial output by mere 1.6 per cent. The budget, therefore, attempts to boost the economy through a heavy dose of fiscal deficit to provide stimulus to industrial growth.

Although in an interview last year Manmohan Singh has asserted that the fiscal deficit would be brought down to "no more than 5 per cent of GDP", this budget reverts to the policy of a massive increase in the fiscal deficit. The deficit for 1993-94 (revised estimates) is 7.3 per cent of GDP as against a target of 4.7 per cent budgeted last year. Also, the deficit targeted for the year 1994-95 is as high as 6 per cent of GDP. This is much higher than what was witnessed in 1991-92. Further, going by the experience of what happened to the budget estimates of the last year, as compared to what is achieved through the revised estimates, one could doubt the sanctity of the deficit presented in the 1994-95 budget. If this figure goes awry, we are back to the policy of large deficits.

Assuming that the deficit might increase a little above the budgeted figure, the assertion of the finance minister that the high deficit provided in the budget is to give stimulus to industrial growth and to put the economy back on the track of rapid growth has to be given proper consideration. It is important to realise that even if the deficit enlarges, the increase in inflation would primarily depend upon the response of the supply side. The budget provisions are, therefore, definitely based on a calculated risk: boosting the economy and mobilising resources therefrom.

With a view to providing an environment for a proper response from the supply side, this budget claims to take a leap forward towards a rational tax policy through the implementation of the recommendations of the Tax Reforms Committee (TRC) [Government of India 1992]. Both on corporate tax structure and commodity taxes the budget attempts to provide industry with an environment for heavy investment to enable it to be global. As regards corporation tax, the budget not only reduces the tax rates but in addition the finance minister promises to further look into the capital gains tax when foreign investors prove themselves to be stable in the country. Also, the budget claims that by rationalising customs and union excise duties (UEDs), it paves the way for the value added tax to help achieve an acceptable growth rate for industry.

In the context of the above assertion, this paper analyses the reforms in the UEDs. Since these are industry specific, the paper presents a detailed analysis of the reforms affecting the textile sector as a case study. With a view to evaluating these from the point of efficiency, it delves into the recommendations of the TRC. Finally, the paper presents an evaluation of the proposals and puts forth reforms that must be introduced to give a fillip to exports from the textile sector.

Reforms in UEDs

One of the important reforms of this budget relates to rationalising the UEDs through reduction in the number of rates. Since the existing structure is characterised by a plethora of rates, it is essential that these rates are reduced as much as possible. This budget attempts this through the twin measures of (i) converting specific excises into *ad valorem* rates,[1] and (ii) reducing the total number of rates to about half the existing number. In addition, the budget halves the number of exemption notifications. Since a large number of rates as well as exemptions complicate the tax structure and create administrative inconvenience, it is certainly an important step towards rationalisation.

Also, it extends MODVAT to petroleum products (excluding high speed diesel) and to yarns which would bring another 15 per cent of the basic excise revenue under MODVAT. It proposes to cover all capital goods and machinery under MODVAT. The extension of MODVAT is thus a major step towards introducing VAT.[2]

An attempt is made to reform the tax rates in the textile sector. The budget proposes to neutralise rates between fibres and yarns by proposing an excise duty of 20 per cent on all fibres and blended spun yarns. Thus polypropylene spun and acrylic spun yarn are taxable at the rate of 20 per cent. This would obviate the problems of classification. Also, it proposes a three-rate schedule of 60,30 and 15 per cent on polyster filament yarns; nylon and polypropylene (and PBT) yarn and on viscose (nylon) filament yarn, as well as polyester silk and woollen yarn respectively. For industrial yarns, it proposes to have lower rates of 30 per cent on polyester filament yarn, 20 per cent on nylon tyre yarn and 10 per cent on viscose filament yarn (above 350 deniers). Cotton yarn is taxable at the low rate of 5 per cent only.

Since the budget places heavy reliance on the supply side, this paper examines the reforms proposed in the budget to see whether these would provide a suitable environment for the purpose. As a case study, it takes up details of rationalisation of tax on one of the important sectors, viz, the texile sector.

Tax Reforms in Textile Sector

Textile is the largest single industry in the country accounting for around 20 per cent of the total industrial output and providing employment to about 17 million people. Also, in terms of earning foreign exchange, it contributes nearly 30 per cent of the total value of exports. The trends in output from the industry, as given in Table 1, show that cotton continues to contribute 70 per cent of the total fabric production. In the context of this structure of the textile industry, the tax proposals in the budget 1994-95 are as follows:

First, there are some changes in tax rates on inputs. These include increase in tax rate from 5 to 10 per cent[3] on auxiliary machines (such as OER spinning machines shuttle-less looms, auto-comb winding machines and two for one twisters) and raising tax on almost all other inputs such as acids, hydrogen peroxide, bleaching paste and powder, sodium hydrosulphite, soda ash, DMT, PTA, MEG, acrylonitrile and caprolactum. All these inputs are taxed at 20 per cent against 15 per cent at present. However, there are some items on

which tax has been reduced by 5 per cent. These include optical bleaching agents, organic surface active agents and other synthetic organic dyestuffs. Since these inputs get modvated, their cascading effect is eliminated. However, it does make a difference if the inputs are used by the decentralised sector not covered under the MODVAT.

Secondly, the tax rate on yarn has been made *ad valorem*. Prior to this, there were innumerable rates based on counts. These ranged from Re 0.58 to Rs 9.78 per kg. As shown in Table 2, in *ad valorem* terms the variation was from 1.17 per cent for yarns of 2/6 counts to 6.87 per cent for 100s weft carded yarns. The proposed *ad valorem* rate for cotton yarns now stands at 5 per cent for UED plus 15 per cent of additional excise duty in lieu of sales tax (AEDILST) on UED bringing the total incidence to 5.75 per cent. Similarly, man-made fibres and yarns are taxed at one single rate of 23 per cent through adjustments in tax rates of various yarns. There is an increase in tax rate to 23 per cent on items such as polyester/cotton blended yarn (from 14.79 per cent) acrylic spun yarn (from 14.95 per cent). VSF spun yarn (from 15.45 per cent), and polyester staple fibre (from 19.46 per cent). At the same time there is a reduction in the tax rate to 23 per cent on items such as viscose staple fibre (from 33 per cent), acrylic staple fibre (from 26.69 per cent), and polyester/viscose blended yarn (from 25.7 per cent). However, two different rates exist: 5.75 per cent (as compared to 1.24 per cent) on sewing thread/industrial yarn, and 69 per cent (as against 85.19 per cent) on polyester filament yarn. Thus, the number of rates have been reduced considerably, although the number is still much higher than that recommended by the TRC.

Finally, the search for a revenue neutral rate has resulted in increasing the overall incidence on fabrics. It is clearly seen from Table 2 that the tax rate has gone up for the low priced fabrics. For example, there is an increase of Re 0.25 per metre for a fabric costing Rs 20 per metre and of Rs 3.33 for a fabric costing Rs 30 per metre. Likewise, an increase in tax rate is witnessed in blended/machine-made fabrics. However, the incidence declines with the increase in price of the fabric. The incidence of the tax has also increased due to taxation of 'chindis' and samples, so far exempt from the tax.

Whither Tax Reforms?

An evaluation of the proposals of tax reforms in the budget suggests that the simplification is a welcome step. Both in terms of converting specific rates into *ad valorem* rates and in terms of reducing the number of rates, the budget has moved in the right direction. However, the speed of reforms is painfully slow. In fact, it was expected during the last budget that the number of rates would be brought down to two or three, as recommended by the TRC. Granting that the time available to the finance ministry was inadequate at that time, it was necessary to carry out this exercise during this budget

The experience of reforms in various countries suggests that speed in such reforms is crucial. All the reforms must be attempted as fast as possible. Also, the priorities are important. Adopting the reforms slowly or in bits and bursts affects relative prices. It leads to clash of vested interests and invites political interference causing great inertia to reforms. The delay in reforms ultimately defeats their very purpose. It is, therefore, extremely important that the rates are simplified as early as feasible[4] and possibly in just one go.[5]

While attempting to remove the complexity of the tax on textile sector, this budget has increased the overall incidence of the tax. Almost all the rates are on increase. Some homework seems to have been attempted after the presentation of the budget to restore the tax incidence on texturised yarn to the pre-budget level.[6] However, the overall incidence is extremely high (Table 2). The increase in the incidence of the tax is contrary to the principles enunciated by the TRC and would in all probability have an adverse effect on the output as well as on the demand of the industry. The involved tax incidence at the earlier stages would affect export prospects due to cascading and pyramiding of the taxes.

In addition, the budget does not examine the problem of levy of UEDs on the captive consumption of yarn and the treatment of depot sales. Since these involve subjective assessment, it is essential to simplify procedural requirements. This has not been attempted.

In confining the MODVAT to yarn sector, the budget has created unhealthy competition between the unorganised and organised sectors. This is due to the fact that the process of manufacturing yarn has six major activities, viz, (i) carding, (ii) spinning, (iii) doubling, (iv) dyeing, (v) raising and (vi) ball-packing. The value added is approximately 100 per cent up to doubling and additional 100 per cent through the process involved in dyeing, raising and ball-packing. Since the unorganised sector purchases yarn from the organised sector which has already undergone the processes up to doubling, the proposed system of MODVAT extended up to yarn sector would make unorganised sector pay tax only up to that stage. However, the organised sector would have to pay up to the last stage. This would create disadvantageous situation for the composite mills which are required to pay tax up to the final sale price.

It is, therefore, important to rationalise the overall tax policy for the textile sector. In fact, the TRC has recommended that the VAT should be introduced in the overall textile sector [Government of India 1992: 40]. The report suggests that the first stage reform should consist of introduc-

tion of MODVAT scheme till the yarn sector and applying the MODVAT principle to cotton textiles without subjecting grey fabrics to tax at the present time [7] As a next stage, the TRC recommends that the MODVAT scheme be extended to the composite mills in the cotton textile sector immediately Soon thereafter the same system be applied to synthetics and blended fabrics other than those made from filament yarn These reforms have to be attempted immediately

Whereas the requisite reforms in the textile sector are still awaited, some reforms in other sectors have been brought about in undue haste One such reform relates to extension of MODVAT to capital goods

From the economic point of view, the priorities have to be set This is especially important because the speed of reforms involves certain political factors [Bhagwati and Srinivasan 1993] In this context, the views of the TRC for extension of MODVAT to capital goods are important The TRC states that "the reduction in rates, the removal of concessions and the extension of coverage have to be undertaken simultaneously because *only then* all of them become possible" (TRC, Pt I, p 36) Further, it suggests that the "extension of MODVAT credit for machinery not fully at the time of purchase but in instalments during a subsequent period of years which could be laid down in the law (TRC, Pt I, pp 39 and 172)

Unlike the above rationale of the TRC, the budget 1994-95 has decided to introduce MODVAT on capital goods in one go Accordingly, the entire amount of duty would be credited in one instalment in the year of purchase/installation of the machinery The revenue implications of this proposal is estimated to be Rs 8,000 crore Presumably, this does not take into account the refund of countervailing duty (CVD) on the imports of machinery, which would also get MODVAT credit Thus, the overall loss of revenue due to MODVAT of UEDs and CVDs would be substantial

Similar haste in reform relates to extension of MODVAT to petroleum products The TRC in this regard opined that "in any case petroleum and tobacco have to be subjected to high rates and their use discouraged Accordingly, it is recommended that these items need not be brought under the proposed system" (TRC, Pt I, p 40) Further, the TRC recommends that "in addition to the VAT at the manufacturing stage, there should be excises on a gross value basis on a few commodities, such as petroleum products, tobacco products and certain luxury goods These excises would serve to achieve the objectives of sumptuary taxation as well as achieving a degree of progression in the taxation of consumption" (TRC, Pt I, p 39). Thus, contrary to the recommendations of the TRC, the budget 1994-95 extends MODVAT to petroleum products at the cost of loss of revenue to the tune of Rs 3,000 crore In addition, it does not attempt any levy of sumptuary excises on these products, which are prevalent all over the world For example, a large number of OECD countries levy additional excise duties to attain progressivity Similarly, in the Asian continent Korea levies special excise tax on luxury items and the rates vary from 5 to 100 per cent [Purohit 1993 43-46]

Revenue Implications

Since the reforms have revenue implications, some of the reforms have to be attempted first to enable the other reforms to follow suit On this count, the budget 1994-95 has faltered Some of the reforms are painfully slow, while others are in undue haste The failure to keep pace with the desired priorities and requisite speed has created serious revenue implications which in turn hamper necessary reforms

One such reform relates to the undue haste in introducing MODVAT for petroleum products and capital goods It has cost the exchequer Rs 1,150 crore, which is one-fifth of the total revenue loss due to the tax proposals, as shown in Table 3 This suggests that the budget could have done extremely well in extending certain other priority reforms by not implementing reforms related to petroleum products and capital goods These were neither recommended by the TRC nor immediately necessary for tax reforms in the country In addition, sumptuary excises could have been levied to yield a substantial revenue under the UEDs

Further, the introduction of VAT to petroleum and capital goods sector has made the government to raise resources from the other sectors (Table 3) Additional resources have been mobilised by increasing tax rate on chemicals (Rs 227 crore), iron and steel (Rs 350 crore), other raw materials (Rs 430 crore), cigarettes (Rs 320 crore) and textiles (Rs 240 crore) These sectors would be adversely affected A lot more rationalisation could have been attempted if the revenue implications of extension of MODVAT to capital goods and petroleum had been avoided

The revenue implications for the textile sector is both from the yarn and the fabrics As regards yarn, the budget has raised the tax rates for most of the counts On estimated turnover of Rs 94,505 crore of dutiable cotton yarn, the net additional yield works out of Rs 136 crore The incidence of duty on polyester/cotton blended yarn has more than doubled Consequently, the additional burden works out to Rs 77 crore Similarly, increase duty on viscose staple fibre spun yarn an estimated production of 75 million for domestic consumption would yield 65 crore The additional yield would Rs 40 crore for acrylic spun yarn, Rs

crore for sewing thread and industrial yarn,' Rs 60 crore for cotton fabrics, Rs 63 crore for blended/man-made fabrics and Rs 10 crore for chindis and samples. Thus, the revenue implications for textile sector would be approximately Rs 500 crore, as against estimates of Rs 240 crore.

Proposed Reforms

The above analysis indicates that there is need for rethinking about reforms under the UEDs. To set the pace of reforms in proper perspective, it is important to accord due priority to reforms urgently needed. Once the MODVAT is withdrawn from petroleum and capital goods sector and sumptuary excises are levied on select items as recommended by the TRC, the budget would have enough resources to attempt priority reforms as follows:

Introducing Three-Rate Schedule: An important reform in restructuring UEDs is to have a rate structure with just two or three rates. This is a pre-requisite for further reforms in the UEDs [Purohit 1993a]. As recommended by the TRC we could have 10,15 or 20 per cent rates. In addition, a higher rate of 20-30 per cent be levied on sumptuary goods bringing the total incidence on such goods to 30, 40 or 50 per cent (TRC, Final Report, Pt II, pp 128-32, Annexure XI.I).

Extending MODVAT to Textile Sector: With a view to rationalising the tax policy for the textile sector it is important that the MODVAT is *not* confined to input stage. It must be moved beyond yarn and up to fabrics. Such an extension would sort out the intra-sectoral problems of competition between the organised and the unorganised sectors. Such an extension would pose no problems for the organised sector where the mills would in any case be paying tax at each stage after getting MODVAT credit for the tax paid at the earlier stages. However, for the unorganised sector, there might be some competitive advantage, although it would be marginal and only at the initial stage. In the overall process covering all activities from yarn to fabrics, the unorganised sector would not have any gains. In fact, this sector would be put to a competitive loss if the yarn is sold once more to the composite mill or the grey fabrics are sold to the mills for further processing. This is because no MODVAT credit would be available to the purchaser due to the break in the chain. With a view to putting the unorganised sector at a reasonable advantage, we propose that a notional credit be given when the unorganised sector sells yarn to mills after dyeing, raising and ball-packing. Since this sector would have paid MODVAT on carding, spinning and doubling activities in any case to a mill, a notional credit could be estimated for the tax so paid. Similarly, when grey fabrics are sold to a mill, a notional credit could be estimated to put these units back to the system of MODVAT. Such Schemes are prevalent in various countries. Adopting the system of notional credit would put both the sectors at par.

Exemption of Chindis and Samples: An important feature of the recent budget is the extension of tax base to chindis and samples. Chindis are normally considered a value loss in production.[8] Similarly, samples have no commercial value in business. Hence it is irrational to tax *chindis* and samples. In fact, chindis are among various aspects of value loss in production. Value loss of chindis could be defined as follows:

$$V(P) = \frac{\sum_{i=1}^{n} P_i V_i}{\sum_{i=1}^{n} P_i}$$

where, n = number of sorts in a mill:
V_i = per cent value loss of i^{th} sort; and
P_i = total production of i^{th} sort

The production loss estimated as per the above method accounts for loss due to chindis, i e, bona fide cut pieces which are (a) 23 cms or less in length; (b) more than 23 cms in length but not more than 7.5 cms in width, and (c) man-made fabrics of all kinds, not more than 30.5 cms in width. According to a survey report of Ahmedabad Textile Industry's Research Association (ATIRA), the value loss on account of chindis is 0.8 per cent of the total cotton cloth production [ATIRA 1985]. In addition, all sorts of samples (i e, samples of woollen, cotton and man-made fabrics) are exempted because these are not used for sale. The samples are made from fresh cloth. Hence these are a part of sales cost. An estimate of sales-value loss is that up to 0.2 per cent of the output is used for samples. Since both these components along with fents, rags, and flag allowance are nothing but value loss in production, it is advisable to revert back to grant of exemption to these items under the UEDs.

Procedural Reforms: Finally, an important reform relates to administrative procedures. The budget has attempted to simplify the procedure of approval of price lists. So far the practice was to have approval of price lists from the excise department prior to clearance of goods from the factory. Elimination of this archaic procedure would greatly help the industry. However, in regard to the procedural reforms the budget has tackled only the tip of the iceberg. In fact, there are various time consuming and involved procedures both in regard to declarative obligations and accounting obligations [Purohit 1993c]. The budget has not looked into the simplification of these aspects. At present there are numerous forms (RG-1, RT-12, Form 4, RT-11) in addition to gate passes (GP-1, GP-2).[9] Also, the accounting requirements include maintaining accounts of forms RG-23 Pt 1 (for inputs received), RG-23 Pt 2 (for duty credit) and a personal ledger account (PLA) for adjustment of tax credit.[10] These archaic systems of tax management need to be simplified along with the rationalisation of the tax.

To conclude, the process of tax reform initiated earlier has been carried forward through the budget 1994-95. However, the pace of reforms is erratic; it is painfully slow in some aspects and unduly fast in others. Also, the approach to reforms is piecemeal. The most important reform relates to bringing down the number of rates to two or three. Without this reform VAT cannot be introduced. The priorities in reform are equally important. As suggested by the TRC, the extension of MODVAT to petroleum and capital goods sector should wait and the textile sector must get highest priority for its coverage under MODVAT. This could be accomplished with a system of notional credit for the unorganised sector.

Notes

1 Rate of Additional Excise Duty in lieu of Sales Tax (AEDILST) have also been made *ad valorem* For example, AEDILST on cotton fabrics ranges between 5 and 10 per cent and other fabrics and man made fabrics between 10 and 20 per cent

2 Here it is important to note that at present MODVAT does not include tobacco, textiles, petroleum products, matches and cinematographic films which yield approximately half the revenue of UEDs as per the revised estimates of 1993-94

3 The tax rate continues to be the same (10 per cent) for all other machines. In addition, the budget provides MODVAT credit for capital goods

4 Most VAT-countries of the world levy rates ranging from one to three only In fact, many of the countries have just one rate [Purohit 1993a and 1993b]

5 It is necessary to attempt such rationalisation in just one go Once we achieve the objective of three-rate schedule, almost all the problems of notifications and variations in rates and relative prices through such rates would be over In fact, the present procedure of issuing notifications for changes in tax rates which serves no useful purpose would automatically be inoperative sector

6 *The Economic Times*, March 30, 1994.

7 The TRC has chosen the cotton sector both because this sector has comparative advantage in this sector and because the rate of duty on cotton yarn is not unreasonably high. However, the TRC feels that "MODVAT principle could be applied to man-made and blended fabrics other than those made from filament

yarn with the help of the same system as for cotton textiles" (TRC, p 42)

8 Value loss is the difference between the sale value which would have been realised if 100 per cent cloth would have been sold as sound and at actual sale value

9 The introduction of invoice system would do away with the procedure of subsidiary gate passes, as notified by the Central Board of Excise and Customs on March 31, 1994 However, gate passes or certificates issued before March 31, 1994 would remain valid for claiming MODVAT till June 30, 1994

Agriculture and Liberalisation

Some Implications for Development Policies

V M Rao

Considering the economy as a whole, including agriculture and its present development status, liberalisation can be a step in the right direction provided it is used as a strategy not to withdraw the government from the economy but to shift the focus of government policies and concerns from helping and subsidising the organised parts of the economy, which are now viable enough to operate on their own, to building up the economy and society in the vast unorganised parts lacking development and remaining backward. Such a strategy can promote broad-based agricultural growth which would not only increase the growth rate of the economy but, more important, enable the backward areas and the poor to participate in growth and share in its benefits. Without such a long-term perspective, liberalisation, instead of promoting growth would only intensify the gathering crisis in the economy.

I
Introduction

A NOTICEABLE feature of the Union Budget for 1994-95 in its dominant theme of achieving growth through liberalisation. The strategy of allowing the fiscal deficit to reach the dizzy height exceeding 7 per cent of GDP in the hope that it would kick-start industrial recovery has been seen by many observers as a rash gamble. The finance minister has referred to the features favourable for a quick spurt in industrial production through infusion of extra demand into the economy—availability on the one hand of idle industrial capacity which could be activated at a short notice if the demand conditions are buoyant and, on the other, accumulation of foreign exchange reserves and large food stocks with the government reducing the risk of overheating the economy through deficit—induced stimulation of demand.

While a finance minister has indeed to take note of such short-term considerations, liberalisation, viewed as a long-term restructuring of the economy for faster growth, needs more substantial foundation than passing circumstances favouring industrial recovery. It is based on an approach to growth and development radically different from the approach adopted so far relying on the government control of the 'commanding heights' of the economy. The former approach leaves economic processes free to operate through market forces and activities of private enterprise. A little reflection would show that a combination of both the approaches is necessary for the sound development of the economy. A measure of liberalisation has become appropriate at the present juncture in the Indian economy precisely because the government and the public sectors and the modern infrastructures and industries developed by them have created conditions where the further growth of the organised parts of the economy could be left to markets. However, a large part of the economy—particularly, rural and agricultural—still remains unorganised and backward. Liberalisation of the economy would have to proceed along with a continuing government role to help these parts to get integrated with the market-led mainstream economy. Unless the government plays this role effectively, the problems arising from the weaknesses of the unorganised parts would further worsen with time. They are at the root of the features like growing rural-urban dualism and policy biases hindering development which are being noted with considerable anxiety by the development economists [Bhalla 1993; Madhur 1994; Rao S L 1994]. The purpose of this note is to describe the priority tasks deserving urgent attention in the agricultural sector.

II
Three Subsectors in Agriculture

The *Economic Survey, 1993-94* mentions that the growth rate of agriculture so far has been 2.2 per cent per annum and that the growth rate needs to be stepped up to 3 per cent per annum in the coming years. Considering the wide diversity of physical and socio-economic conditions in the country, it is clear that any assessment of the prospects for agricultural growth would have to adopt a disaggregated approach, particularly if the focus is not on the arithmetics of growth but on the policies required to help growth in the different environments obtaining in the country. It is useful for this purpose to distinguish between the three subsectors in agriculture which need sharply contrasting policy regimes. The first subsector consists of agricultural/agro-based activities carried out by the business entities belonging to the modern organised industrial sector. Liberalisation is likely to encourage them to take up the production and marketing of speciality items in the field of horticulture, floriculture, fisheries, etc. They may also establish links with farmer groups for supply of farm outputs for processing into branded products for sale in domestic and export markets. This subsector is likely to give rise to enclave-like development though its activities could be of considerable help in increasing exports, creating skill-based opportunities in agriculture and in technological upgradation of farming. As regards policies, the subsector would primarily need a level playing field like other industries and a legal-cum-regulatory regime which is not excessively restrictive. Beyond this, it should not receive any further aid or support as it is expected to be efficient and competent enough to function on its own.

The other two subsectors in agriculture consist of 'green revolution' areas which have made considerable progress towards modernisation and market linkages and the other areas containing some of the most backward parts of agriculture. It would not be easy to mark out these two subsectors clearly in the agricultural map of the country. However, a good idea of some of the characteristic differences between the two subsectors can be obtained from Table 1. It can be seen from the table that while all the major crops and crop-groups bear the evidence of growth in production during the post-independence period, a sharp contrast has emerged among them in relation to the extent of increase in production, improvement in yields and extension of irrigation.

The contrast is attributable to a number of factors including soil-climatic but an important contributor has been the pronounced policy bias towards the 'green revolution' crops as indicated by the dramatic performance of wheat (a nearly nine-fold increase in production and a four-fold increase in yield along with a quantum jump in the extent of irrigation) and of rice. These crops have benefited most from the supportive policies for adoption

of new technologies, intensified use of modern inputs and increased availability of dependable irrigation [Misra 1993; Sinha 1994]. The next two crops in the table—cotton and oilseeds—are illustrative of the policy-maker's attempts in recent years to move beyond the 'green revolution' crops. Their performance is relatively modest as compared to wheat and rice. It also needs to be mentioned that their production and yield continue to remain unstable and, as a result, their markets often go through volatile and speculative price changes. However, the improvement in these crops is of particular significance for the future as it provides ground for hope that, with patience and perseverance, our policies do have the capacity to promote growth in situations which have been considered so far as uncongenial for modernised agriculture. Viewed thus, the last two crops in the table—whose performance in terms of increase achieved in production is poor—can be regarded as crops which have been neglected so far in our development policies for agriculture. The performance of pulses has been poor despite strong demand pressure and high and rising price levels. Prima facie, lack of policy support is the main hurdle faced by this crop group. As regards the coarse cereals, they are neglected by the policy-maker as well as by the market as the demand for them is weak, their short shelf-life comes in the way of providing effective price support and the new technologies developed for them are modest in impact and need local adaptations.

The 'green revolution' subsector has been nursed so far by a policy regime whose main components have been substantive subsidies on modern inputs (including irrigation and credit) to help adoption of new technologies, government procurement at support prices and a wide range of formal and informal restrictions on trade, movement and exports/imports. A beginning has been made to remove restrictions and to progressively reduce subsidies. Freedom from restrictions and exposure of the subsector to market—determined output and input prices would enable it to become capable of operating without any crutches. There would be limits to this process so long as the food security system—highly centralised and depending entirely on rice and wheat—continues in its present form. With the 'revamping' of the food security system, tighter targeting and decentralisation, it would be possible to tap more fully the growth and enterprise potential of the 'green revolution' subsector. The 'other' subsector has received meagre policy support so far excepting relief and assistance programmes. The subsector usually attracts attention only during period of distress. Both the endogenous impulses for growth and the external forces bringing beneficial changes have been weak in these areas. However, their isolation is getting progressively eroded and, along with that, their vulnerability to external events is also increasing. The other side of the coin is that, as compared to the situation some decades back, these areas are now likely to be far more responsive to development interventions. They need a wide-spectrum policy regime comprising anti-poverty programmes, provision of infrastructures, improvements in markets and institutions, schemes for input supply and, above all, supportive macro-economic policies. The task of developing these areas is akin to building up a society and not merely investing in the sector of an economy.

III
Prospects for Agricultural Growth in Poor Areas

Agricultural scientists take the view that the Indian agriculture is still well within the limits imposed by our land and water resources. Unchecked population growth would indeed eventually push the economy closer to these limits and, hence, measures for demographic control would have to be a top priority item in the policy agenda. However, in the field of agriculture over the medium term, the focus would have to be on devising policies for acceleration in agricultural production without impairing the objectives of sustainability of growth and of conservation of resources. Scientists assure us that there are promising opportunities precisely of this kind in large regions across India which are still relatively untouched by policies for agricultural development. We can do no better in this paper than describe a few illustrative cases

Eastern India

M S Swaminathan has described the eastern region of India as a 'non-green-revolution' green area offering scope for substantially higher production within a reasonable time. Social science observers of the region have catalogued a number of institutional barriers inhibiting agricultural growth. Field visits to poor groups like small jute growers in backward pockets would leave an overwhelming impression of unrelievable poverty. Placed in an environment of shrinking export markets, sick manufacturing units, speculative traders and absence of new technologies, the jute growers indeed face a grim future. However, during the latter half of the 1980s substantial increase in agricultural production seems to have taken place in some areas in this region [Rao, C H H 1994]. The performance of West Bengal in recent years in agricultural and rural development has been impressive. Even the jute industry is showing some signs of revival through diversification of products and prospects of increased exports. On the whole, the indications are that the situation in the eastern region might have reached a stage where determined policy efforts to increase production would evoke good response. The region needs major reforms in infrastructure, markets, credit and co-operatives. Once these pre-conditions for steady growth are established, it would be easier to tackle the other problems in the region like those connected with land relations.

Dryland Areas

The dryland areas in the central, western and southern parts of India have a weak and exhausted land base and poor water resources. While the relief needs of these areas during periods of scarcity receive prompt and even generous policy response, little success has been achieved so far in setting up stable arrangements for conservation and optimum use of land and water resources in the region and to insulate the farm economy from the disruption caused by periodic droughts [Rao, V M 1992]. When this is done, the region would find it possible to absorb the new technologies which are being developed to suit the conditions of the region. There are already a number of successful experiments in this region where local leader-

Table 1: Production, Area and Yield of Important Crops/Crop Groups

Crop	Production (million tonnes)		Area (million hect)		Yield (kgs/hect)		Per Cent Irrigated Area	
	I	II	I	II	I	II	I	II
Wheat	6.4	55.1	9.8	23.0	655	2397	31.5	78.4
Rice	23.5	73.7	30.5	42.3	771	1741	32.3	45.2

ship has organised people to improve farming through their own efforts and use of local resources. The main problem is to arrange for replication of such experiments on a sufficiently wide scale and to provide for the components of public sector investments in the region. While the region may not achieve quick and dramatic increases in agricultural production, considerable expansion in employment, sizeable improvement in levels of living and effective coping with weather-related instability would be feasible objectives for the region to achieve given the required policy support. Considering the proneness of this region to chronic poverty, progress in realising these objectives would be a major gain for our development strategy seeking to bring the poor within the mainstream economy.

Fallow and Waste Lands[1]

The land-use statistics show that even as recently as in 1989-90 fallow and waste lands totalled to 56 million hectares. They formed nearly 20 per cent of total reporting area (305 million hectares). The importance of their judicious use can be gauged from the fact that the Indian agriculture has the land base of only 140 million hectares of net area sown. While fallow and waste lands cannot support regular cultivation, putting them under tree cover would serve both the purposes of conservation of land and adding to agricultural production through increased output of tree-based and related products. The land-use statistics show that an active policy regime is yet to emerge for the fallow and waste lands. Land classified as current fallows increased from 11 million hectares in 1950-51 to 16 million hectares in 1989-90 and 'other fallow land' after decreasing from 17 million hectares in 1950-51 to nine million hectares in 1970-71 registered a small increase in later years to reach the level of 11 million hectares in 1989-90. As regards 'culturable waste' land, its extent decreased from 23 million hectares in 1950-51 to 18 million hectares in 1970-71. But the decrease in the next two decades was quite modest and in 1989-90 there were still 15 million hectares of culturable waste lands. On the other hand, the land under tree crops decreased sharply from 20 million hectares in 1950-51 to four million hectares in 1989-90. The grazing lands and permanent pastures also decreased from 14 million hectares in 1960-61 to 12 million hectares in 1989-90. It needs to be mentioned that though fallow and waste lands occur in all regions, they are likely to be concentrated precisely in the regions having weak agriculture. Their development, preferably through grass roots level organisations of rural people, could bring many benefits to the backward areas, particularly to the poor in these areas. Where such organisations are not available, private enterprise might be in a position to develop the fallow and waste lands though care would have to be taken to see that the local people share adequately in the benefits flowing from the development of these lands.

IV
Critical Policies and Priorities

The agricultural growth achieved so far has relied chiefly on the potential of a small part of our resources located in the green revolution area. The new strategy based on promoting broad-based agricultural growth would need to shift towards resources in other regions requiring different technologies but also providing opportunities to spread agricultural growth far more widely and to make the development process genuinely participatory and poor-friendly than has been the case in the past. While this shift in emphasis would mean a growing and eventually large role for local people and voluntary organisations, the transition would need time and strong policy support to activate the development process at the grass roots level. Four policy areas which are likely to be of critical importance are described below.

Support Measures

A major handicap of the third subsector of agriculture is that the dispersed small producers, unless suitably organised for group action, find it extremely difficult to cope with volatile, unpredictable and, often, depressed markets. Consider, for example, the behaviour of wholesale prices in the five markets connected with cotton and its manufactures—raw cotton and handloom cloth where producers are rural, small, dispersed and unorganised and cotton yarn and cotton cloth (mills and powerloom) whose producers are urban-based and much better organised (Table 2).

The period covered by the table–September 1990 to March 1993–witnessed a sharp inflationary rise of nearly 30 per cent in the wholesale price index for 'all commodities' from 181 to 233. There was a matching rise in the index for cotton yarn and cloth. On the other hand, the increase in the index was only 8 per cent in the case of handloom cloth indicating fall in its real price when the price of cotton yarn—its main raw material—was rising sharply. Even more alarming, the index for raw cotton increased by nearly 80 per cent from September 1990 to September 1991 and, thereafter, declined continuously from the peak level of 252 to 202 in March 1993. Table 2 reflects well the hardships suffered by cotton cultivators and handloom weavers in marketing their produce. An implication of Table 2 is that such market-vulnerable producers would have to be given a measure of protection through price support and market intervention policies. Such policies are difficult to devise. By a convenient coincidence, the present state (in February 1994) of the cotton market provides a good example of these difficulties. The high prices of cotton prevailing at the moment despite its comfortable availability in the economy have baffled both the government and the industry and the drastic measures like banning of exports of cotton being taken by the government reflect more a sense of panic than deftness in handling a tricky situation created by shrewd speculators and hoarders

Table 2: Index Number of Wholesale Prices
(Base 1981-82 = 100)

Month	Raw Cotton	Cotton Cloth (HL)	Cotton Yarn	Cotton Cloth (Mills)	Cotton Cloth (PL)	All Commodities
September 1990	141.3	201 6	187.3	157 6	169.6	180.9
December 1990	153.3	201 6	190 6	162.1	174.9	186.6
March 1991	171.9	200.6	195.4	166.6	192.7	191.7
June 1991	219.6	202.7	208.3	177 9	193.1	198.4
September 1991	251.5	202.7	240.6	184.1	200.0	210.4
December 1991	242 1	202 7	241.2	185.6	196.9	213.2
March 1992	231.1	213.1	258.2	196 9	196.9	217.7
June 1992	233.1	216.6	248.1	198.3	209.5	224.1
September 1992	217.7	216 6	254.2	199.7	214.1	230.7
December 1992	204.8	216.6	254.2	201 5	218.9	231.4
March 1993 (P)	202.3	218.5	252.2	205.8	226.8	232.5

Investment[2]

The gross capital formation in agriculture (at 1980-81 prices) which was in excess of Rs 5,000 crore per annum in the late 1970s is estimated to have declined to levels close to Rs 4,000 crore per annum over the 1980s. The major reason for this decline has been the sharp fall in the public sector gross capital formation from nearly Rs 1,700 crore in 1978-79 to less than Rs 1,200 crore in 1989-90. There has been some decline in the private sector gross capital formation also and, considering its complementary relationship with the public sector capital formation, the situation may further worsen unless the latter revives. A plausible explanation for the decline in the public sector capital formation is that while the tempo of investment in the green revolution areas is slowing down, the other areas whose investment needs are large and pressing are yet to receive the attention they deserve. It is obvious that development of watersheds, conservation and productive use of common lands and provision of wide range of infrastructures for backward areas would all need substantial amounts of public investments. A systematic assessment of these needs and arrangements to meet them would have to be given priority to raise the public sector capital formation.

Panchayati Raj Institutions

Reaching investments and development inputs across large and widely spread areas needs active networks of grass roots level organisations. Those like co-operatives and voluntary groups have to emerge through the initiative of local people themselves and the government can only lend a helping hand. On the other hand, the institutions to bring about decentralisation in administration and in development planning and implementation have to be established and nurtured by the government. Without effective local-level integration of schemes, co-ordination in implementation, participatory mechanisms and continuous monitoring, it would hardly be possible to implement the development strategy for agriculture sketched in this paper. In large parts of areas to be reached, the situation is likely to be one of institutional vacuum. However, determined efforts would have to be made to establish the panchayati raj institutions and to put pressure on them to shoulder the tasks of decentralised development as is being done in a few states like Karnataka. The tendency among the policy-maker is still to take it for granted that once priority is given to a sector in terms of larger allocation in the Five-Year Plans, the development of the sector would automatically follow. In the case of agriculture (and rural development in general), ineffectiveness of the grass roots level organisations is likely to be a constraint which is far more difficult to overcome than the problems in enhancing the plan allocations for the sector.

Incentive Framework

There is a misconception that the agricultural sector as a whole is a heavily subsidised and pampered sector. Scholars who have looked at the direct as well as indirect interventions of the government in the agricultural sector find that the net effect of all these interventions is equivalent to imposition of a modest tax on agriculture rather than handing out large subsidies [Gulati and Sharma 1992]. Others have pointed out that subsidies categorised as agricultural often reach manufacturers of inputs or meet the costs of employing expensive government bureaucrats [Tyagi 1991]. Terms of trade for agriculture—which can be taken as a rough indicator of the incentive framework for agriculture and which remained at the level of 100 or above during the period mid-60s and mid-70s—have been below the level of 90 for all the years after 1976-77. Liberalisation implies freeing of domestic input and output markets and permitting exports and imports in response to the changing demand and supply conditions. Agriculture is still subject to numerous restrictions which would have to be progressively relaxed to improve the incentive framework for producers.

V
Conclusions

Liberalisation and deregulation are being viewed by the policy-maker as a strategy for stimulating industrial recovery and for reducing the burden imposed on the economy by the inefficient governmental and public sectors. The purpose of this paper is to argue that, considering the economy as a whole including agriculture and its present development status, liberalisation can be a step in the right direction provided it is used as a strategy not to withdraw the government from the economy but to shift the focus of government policies and concerns from helping and subsidising the organised parts of the economy which are now viable enough to operate on their own to building up the economy and society in the vast unorganised parts lacking development and remaining backward. Such a strategy can promote broad-based agricultural growth which would not only increase the growth rate of the economy but, more important, enable the backward areas and the poor to participate in growth and share in its benefits. Without a long-term perspective and a strong commitment to help the unorganised and poor, liberalisation instead of promoting growth would only intensify the gathering crisis in the Indian economy.

Reforming Agriculture in the New Context

C H Hanumantha Rao

Agriculture can work as the biggest safety net in the process of adjustment by softening the rigours of inflation as well as by raising income and employment for the vulnerable sections of the population. Broadening the domestic agricultural base by stepping up public investment in irrigation, research and extension and in social development such as education and skills formation holds the key to the exploitation of possible gains from trade as well as to ensuring that such gains are widely shared by different regions and classes of farmers.

I
The Institutional Context

THE organisation of Indian agriculture has been based on individual farming under the system of peasant proprietorship, unlike in the former socialist countries. Moreover, no attempts have been made in India to deliberately shift the terms of trade against agriculture. On the other hand, owing to the persistence of imbalances between the supply and demand for agricultural commodities, particularly foodgrains, the terms of trade have continued to be favourable to agriculture throughout the greater part of the plan period including the first decade of green revolution [Thamarajakshi 1977]. Also, because of growing influence of farmers, inevitable in a democratic polity, the farm subsidies—open as well as hidden—have been mounting over a period of time undermining the capacity of the government to make productive investments in agriculture. The rise in subsidies on irrigation and fertilisers has induced the allocation of resources in favour of crops like wheat and rice resulting in the achievement of self-sufficiency in foodgrains and, consequently, some decline in the relative price of these crops during the 80s.

There was considerable underutilisation of capacity in agriculture in the former socialist economies both because of very high rate of capital accumulation for over four decades, achieved in part by using surplus labour for capital construction as in China, and because of the organisation of agriculture under the system of collectives and communes leading to the suppression of markets and gross inefficiencies in the use of resources. In China, for instance, in total disregard for agro-climatic variations across regions, the policy of self-sufficiency in agricultural commodities in each region was strictly enforced. The authorities in communes used to decide what seed to be sown and how much fertilisers to be applied. Therefore, there was a big spurt in agricultural output in China in the 80s when the communes were disbanded, inter-regional trade was opened up and terms of trade were shifted in favour of agriculture.

In India, on the other hand, the rate of capital formation in agriculture has been much lower and utilisation of available capacities relatively more efficient. For example, the proportion of cultivated area irrigated in India is only about one-third, as against over 50 per cent in China. The level of human capital formation in terms of literacy, education and health of rural population was also much higher in China when economic reforms were launched. Moreover, except for occasional restrictions on the inter-regional movement of foodgrains for the purposes of public procurement in India, there has, by and large, been a free flow of commodities and resources between different regions in the country. The success of green revolution would have been unthinkable in the absence of integrated national market in India which has been conducive to regional specialisation in the production of crops. Therefore, unlike in the socialist or command economies, there is little scope for stepping up agricultural output in India merely by improving the efficiency of resource-use at the farm level by restructuring the management of agriculture or by redefining the role of the state in relation to markets

II
Reforms in the Indian Context

The economic reforms for Indian agriculture at present need to be directed basically towards augmenting the productive potential rather than designed merely to improve the utilisation of available resources. The declining trend in investment in agriculture, increasing land degradation, technological stagnation and growing non-viability of credit institutions reinforce the need for such reforms. The reforms for agriculture that need to be undertaken fall broadly under two categories, viz, infrastructural-technological and institutional. The three major areas of concern under the former category are: (i) stepping up public investment in agriculture, among other things, by reducing farm subsidies; (ii) exploring new avenues of technological breakthrough such as the introduction of biotechnologies; and (iii) strengthening of the programmes for soil and moisture conservation in dryland areas by integrating wage-employment programmes with them. The areas of concern on the institutional front are: (i) restoring the health of rural credit institutions; (ii) restructuring institutions for decentralised management of agricultural infrastructure; and (iii) raising incentives for investment and effort by the farmers and improving the efficiency of resource-use by relaxing restrictions on trade in agricultural commodities.

Farm Subsidies versus Investment

It would be instructive to know the increase in the magnitude of subsidies for agriculture incurred by the centre and states together in relation to plan expenditure for the development of this sector. For irrigation we are considering only the subsidy incurred on account of the non-recovery of operation and maintenance charges leaving out the cost of capital deployed. Further, based on the world price of fertilisers, we are assuming that only about half the actual subsidy on fertilisers benefits the farmers and the consumers [Gulati 1990].

The input subsidies, so calculated, on fertilisers, irrigation, electricity and credit combined constituted around one-third of total plan expenditure on agriculture, irrigation (including flood control) and Special Area Programmes incurred by the centre as well as state governments in 1980-81, and rose steeply to as high as 90 per cent of such plan expenditure in 1989-90 [Rao 1994]. If annualised cost of capital invested in irrigation is also accounted for at historical cost, which is quite modest when compared to the replacement cost, the subsidy on surface irrigation during the Seventh Plan period (Rs 11,800 crore) exceeded the Seventh Plan expenditure (Rs 11,000 crore) on major and medium irrigation. The subsidy on rural electricity during Seventh Plan period amounted to Rs 11,700 crore which is about three times the Eighth Plan outlay of Rs 4,000 crore provided in the State Plans for rural electrification in the Power Sector (Eighth Five-Year Plan, p 197). It is clear, therefore, that for every rupee of investment

in agriculture, we are incurring today more than a rupee by way of subsidies on inputs for agriculture.

These subsidies have reached a point where their beneficial effects seem to be outweighed by the adverse effects in terms of macroeconomic imbalances, slowing down of public investment in agriculture, inefficient use of resources at the farm level, degradation of environment, and reduction of employment. Since there is now an overuse of these inputs in limited pockets, efficient pricing of such inputs may lead to greater diversification of their use benefiting a larger number of crops over wider areas. This would result in greater employment and output per unit of capital invested.

The latest data from the CSO up to 1990-91 shows that although gross capital formation in agriculture by the private sector at 1980-81 prices has shown an increase since 1987-88, that by the public sector continued to decline significantly, so that the total real gross capital formation in agriculture in the late 80s is still lower than that achieved in the early 80s. This trend has to be reversed by stepping up public investment in agriculture. For this to happen, it is imperative to reduce subsidies on inputs. However, there is considerable political resistance and, in a democratic polity, the process of change towards rational pricing of inputs is bound to be slow. In these days of globalisation and easy flow of information, it is becoming difficult to convince our farmers about the need to reduce such subsidies when their counterparts in the market economies like the US, Japan and European Community enjoy much higher level of subsidies. Despite some reduction in fertiliser subsidy, the plan investment in agriculture has been declining because of the negligible rise in central assistance to state plans on account of the drive for reducing fiscal deficits. This is being attempted not by reducing revenue deficits but largely by reducing capital expenditures. Also, the states' resources have been eroded by the slow rise in the revenues from the shareable taxes like income tax and union excise duties consequent to the recent reduction in tax rates.

Technological Upgradation

The achievements of the Indian agricultural research system so far in respect of raising yields in the unirrigated and unfavourable agro-climatic regions are not comparable with those realised for the irrigated areas in the early years of green revolution. Even in irrigated areas, the yields under seed-fertiliser technology have been hovering around their peak for some time. The tools of emerging biotechnology like genetic engineering, tissue culture and so on seem to offer significant possibilities for breaking these barriers. The most important feature of biotechnology distinguishing it from the seed-fertiliser technology is the possible saving on chemical inputs like pesticides and fertilisers.

The pro-poor bias of biotechnology arises from this saving on chemical inputs, from its scale-neutrality at the farm level, relative stability in yields and improved prospects for crops grown in agro-climatically unfavourable areas. Biotechnology may also contribute to the protection and regeneration of environment by reducing the dependence on chemical inputs. If farm subsidies are reduced significantly in the developed countries in pursuance of the recently concluded GATT agreement, chemical fertilisers may increasingly be replaced by the renewable sources like biologically fixed nitrogen [Jain 1993]. More significantly, biotechnologies may contribute to eco-protection by raising yields and thus releasing marginal lands from cultivation. They also facilitate large-scale afforestation through tissue culture techniques.

However, being knowledge-intensive and skill-intensive, they necessitate greater investment in research as well as in improving the capabilities of farmers. Although some advanced centres of research in biotechnology have been established in the country, it is not clear how such priorities find their place in the existing agricultural research system in India. It is necessary to have a fresh look at the priorities of the Indian agricultural research system in the light of these emerging prospects and for adequately taking into account the socio-economic factors relevant in the evolution of new technologies.

India is currently investing only about 0.3 per cent of its agricultural domestic gross product in agricultural research, as against 0.7 per cent in the developing countries as a whole and as much as 2-3 per cent in the developed countries [Jain 1993]. Therefore, so far as India is concerned, there is considerable scope for diverting incremental outlays for the priority areas in research. Strengthening indigenous capabilities in biotechnology by involving the private sector in research as well as in the multiplication and distribution of seeds provides an effective safeguard, in the long-run, against the patenting of seeds and other restrictive practices by the multi-national corporations.

Soil and Moisture Conservation

A large part of unirrigated area is characterised by low and uncertain rainfall, low wages and high poverty. Owing to the unregulated exploitation, these fragile areas have been highly degraded. Because of low and defective pricing of electricity, the pumping of ground water has been greater than the recharge resulting in low water table and shortage of drinking water. Nevertheless, there is considerable scope for soil and moisture conservation and for harvesting rain water in such areas by arresting the run-off. The ongoing programmes for this purpose need to be strengthened through better planning and sequencing of works on a watershed basis by involving people and improving co-ordination between various departments. The wage employment programmes, so essential for these areas, can be integrated with the ongoing programmes for soil and moisture conservation, as is being attempted through the Employment Assurance Scheme (EAS) recently launched by the government to guarantee wage employment for 100 days for those in need and seeking employment in drought-prone, desert, tribal and hill areas.

Some of the ardent advocates of economic reform feel that such employment programmes are populist, as they may result in raising the fiscal deficit [Narasimham 1993]. It is important to recognise that such programmes, when properly implemented, will raise agricultural productivity, improve equity and promote sustainability. Indeed, in a democratic polity like ours, reconciling the goals of efficiency with those of social justice is necessary for sustaining the reform process itself.

Credit Reform

According to the Report of the Agricultural Credit Review Committee [RBI 1989], the rural credit system is now threatened by rising overdues and deficiencies in management attributable basically to the policy environment as well as political culture which encourage lending at subsidised rates for activities that are not productive, discourage professional approach and necessary follow-up in lending, and promote wilful default on the part of those who have the capacity to repay. As a consequence, recycling of credit has become a major casualty, the losers being the present as well as the prospective borrowers. Therefore, improving the viability of credit institutions should be foremost on the policy agenda.

Institutional credit for agriculture has to expand at a faster rate than before because of the need to step up agricultural exports and also because the changing product-mix will necessitate larger investments. It would be desirable to phase out the concessional rates of interest as recommended recently by the Committee on the Financial System [GOI 1991], because the normal rates of interest charged by the institutional sources would still be lower than those charged in the informal market. It would, however, be necessary to ensure the timely availability of institutional credit to the weaker sections through appropriate rationing of credit. Otherwise, the well known tendency on the part of the bankers to reduce unit costs by serving a smaller number of big borrowers rather than a large number of small borrowers would result in squeezing credit to the needy sections. Incidentally, the recommendation of the Narasimham Committee that the credit share for the 'redefined priority sector' con-

sisting of weaker sections be pegged at the existing level of 10 per cent does not take into account the need to replace the informal sources on which these sections are heavily dependent at present, let alone meeting the growing demand for credit from them. Subject to such broad guidelines, the managements of credit institutions have to be accorded greater autonomy by doing away with administrative and political interference in their day-to-day functioning.

Decentralisation

The designing and management of infrastructure such as surface irrigation and rural electrification is done by the top-down bureaucratic structures with very little say for the concerns and perceptions of user-farmers. The absence of a link between the payment of service charges and the prospect of improvement in the infrastructural services has provided a fertile ground for the politicisation of cost-recovery processes. Involvement of the user-farmers in the management of agricultural infrastructure through the users' associations and the local level elected institutions represents the closest approximation to privatisation of such activities. Such non-market institutions of representative type at the local level including the voluntary organisations seem to provide the only workable alternative at this stage, whether to bureaucratic management or to full-scale privatisation. The recent agricultural breakthrough achieved in West Bengal points to the efficacy of decentralised management of infrastructure [Sen 1993].

The political and bureaucratic resistance to decentralisation notwithstanding, the need as well as the prospects for decentralisation are much greater now than ever before. The Constitution (Seventy-third) Amendment Act, 1993, has given some impetus to the processes of decentralisation insofar as it mandates periodic elections to the Panchayati Raj Institutions, reservation of seats for scheduled castes and scheduled tribes and for women. However, the states have to muster the necessary political will to delegate to these institutions, the vital subjects bearing on economic development and social justice as listed in the Eleventh Schedule; to devolve adequate resources to them through the mechanism of the state-level Finance Commissions; and to entrust them with necessary power over the administration. The realisation of these goals is bound to be a painstaking and time-consuming process.

The success of decentralisation in achieving its social objectives would very much depend upon the prevailing social structure. It is not accidental that panchayati raj institutions have been functioning well in situations where land reforms have been implemented effectively. Because of low wages and scale-neutrality of bio-chemical technology, there is, as yet, no evidence of increasing returns to scale in Indian agriculture. There is, therefore, no case on efficiency grounds for doing away with the existing ceiling on landholdings and for encouraging large-scale corporate farming at this stage, except in cases where land, hitherto uncultivated, cannot be reclaimed without large-scale investments in heavy machinery and equipment. It would, however, be necessary to remove restrictions on the lease market for agricultural land with a view to ensuring efficient use of resources as well as for augmenting the operational holdings of the small and the marginal farmers.

Trade Liberalisation

There is considerable potential for raising India's share in world exports of agricultural commodities. It is necessary to exploit this potential not only for earning foreign exchange but more importantly to widen the opportunities for raising farm income and employment by diversifying and modernising agriculture. Dryland areas where wages are low and poverty is widespread may benefit significantly from trade, as they have a comparative advantage in horticulture and livestock products, the demand for which is less inelastic than for foodgrains. However, this would require large investments in agro-processing and other infrastructure.

Rice, cotton and wheat seem to have emerged as good exportables up to a point, particularly after the recent adjustments in the exchange rate and convertibility of the rupee on trade account, whereas the imports of edible oils, which have been heavily protected could be increased [Gulati and Sharma 1991]. However, if input subsidies are brought down, there would be some diversion of resources from water-intensive and fertiliser-intensive crops to semi-irrigated crops, thus narrowing down the difference between the international and domestic prices of cereals as well as oilseeds, unless farm subsidies are drastically reduced in the developed countries. Nevertheless, there may still be some gains through trade by specialising in crops like rice and cotton, including particularly in the non-traditional areas like horticulture, and by importing edible oils up to a point.

However, world trade in grains is highly volatile and considering the possible impact of India's decision to export (import) grain on world prices, exports (imports) may cease to be profitable beyond a point. Further, the possibilities of inter-crop substitution with a view to stepping up the output of 'exportables' may not be as bright as may appear at first sight from the highly aggregated data on the relative profitabilities of 'competing' crops. Beyond a point, the rise in the prices of exportables or fall in the prices of importables may affect the incomes of the farmers more than they alter the cropping patterns. Besides, in view of the uncertainties of world supplies, the country cannot run the risk of undermining its food security by running down the domestic stocks below a certain critical minimum, considering the incidence of droughts and the commitments of the public distribution system to meet the requirements of a large population still living below the poverty line. Also, care has to be taken to ensure that the prospects for technological change in respect of oilseeds are not jeopardised because of unremunerative prices resulting from heavy imports. It is important to recognise in this context that technological changes in the case of cereals like wheat and rice after the mid-60s were critical in altering the comparative advantage of different crops.

III
Conclusions

The most important consequence of the reduction in input subsidies for agriculture and the relaxation of restrictions on trade in agricultural commodities would be to raise the investible resources with the government as well as the farmers. This tendency would be reinforced in the long run because agriculture would also benefit significantly from the improvements in the domestic terms of trade, as the industrial inputs for agriculture and consumer goods become competitive and cheaper consequent to deregulation and opening up of the economy. In the short run, however, there is a need to cope with some of the adverse consequences of economic reform such as inflation and slow growth of output and employment. Agriculture can work as the biggest safety net in the process of adjustment by softening the rigours of inflation as well as by raising income and employment for the vulnerable sections of population. Broadening the domestic agricultural base by stepping up public investment in irrigation, research and extension, and in social development such as, education and skills holds the key to the exploitation of possible gains from trade as well as for ensuring that such gains are widely shared by different regions and classes of farmers.

Of the six sets of reforms discussed above, freeing trade for 'setting prices right' is perhaps the easiest to achieve. But ensuring adequate supply response and equitable distribution of gains depends critically on the non-price factors like stepping up investment, technological change, conservation of land and water resources, credit reform and decentralisation of management which are far more difficult to achieve. Therefore, 'freeing' trade without simultaneously undertaking measures for augmenting capacities and building 'safety nets' for the poor may result in slow growth, high prices of foodgrains and the accentuation of regional disparities in development. Excessive pre-

occupation with prices may prove to be harmful by diverting attention from the more important tasks which belong to the non-price world for releasing constraints on production such as investment and technological change [Narain 1976]. The experience with agricultural supply response in several developing countries shows that the elasticity of output with respect to major technological shifters like irrigation is significantly higher than the price elasticity even after the effect of price-induced innovations is accounted for [Krishna 1982]. "National policy-makers and international development bankers will therefore do well to devote at least as much attention and effort to the development of technology, infrastructure, and human capital as to the price environment" [Krishna 1982].

The Budget and 'Structural Adjustment with a Human Face'

K Seeta Prabhu

The structural adjustment programme in the country is being implemented against a background of incomplete structural transformation, low level of human development and distorted patterns of expenditure in education and health. Complicating the issue further is the fact that the bulk of the expenditure on social sectors is incurred by the state governments which have pursued human development strategies with varying degrees of intensity. Given such dismal initial conditions and the low rate of growth of the economy, the pursuit of structural adjustment with a human face depends on the degree of political commitment at both the centre and the state levels.

I

THE current union budget is the fourth in a series of budgets prepared by the union finance minister Manmohan Singh. The budgets presented since 1991-92 have attempted to bring about far-reaching changes in the fiscal structure of the economy in keeping with the philosophy of stabilisation and structural adjustment programmes currently under way in the country with the active support of the international financial institutions. International experience with these programmes suggests that they could often lead to a deterioration in social sector development, particularly in the short run, unless specific measures are taken to avoid such an occurrence. The impact of the budgets presented since 1991-92 in general, and the current budget proposals for 1994-95, need to be examined in the light of such apprehensions. This is particularly important in the case of India, whose low level of human development has been a cause of global concern.

The Human Development of the UNDP Report 1990 had ranked India 123 among 160 countries in the Human Development Index constructed by them.[1] In 1993, India's rank was even lower at 134 among 173 countries. At this level, India's position is lower not only than that of several south-east Asian countries such as Indonesia and Malaysia, but also than that of several south Asian countries [UNDP 1993]. It has also been pointed out that rapid strides in human development have been made at relatively low income levels by China and Sri Lanka, whose efforts at development were initiated at about the same time as that of India [Griffin 1992, Tan and Mingat 1992]. For example, the under-five mortality rate in China and India in 1960 were 203 and 282 respectively. By 1990, China managed to drastically reduce child mortality levels to 42 per 1000 live births whereas in India the rate continued to be more than three times higher at 142. Consequently, while life expectancy in China soared from 47.1 years in 1960 to 70.1 years in 1990, in India the increase was of a smaller magnitude from 44.0 years to 59.1 years, during the same period (UNDP, 1992). In the case of another important human development indicator, literacy, the differences are much more glaring. Several Asian as well as south-east Asian countries achieved high levels of literacy of over 70-80 per cent more than two decades ago while India has yet to reach this goal despite the fact that achieving universal literacy has been an important goal of Indian planning since its inception.

It was necessary to reiterate the above well known facts in order to be aware of the background against which the macro economic adjustment programme has been initiated. The government of India has been repeatedly assuring the nation that adjustment in India would be with a 'human face'. Given this assurance, it only seems logical to examine the impact of the current budget on social sectors against the backdrop of what has been stated above. This paper addresses itself to an analysis of the impact of budgetary measures undertaken thus far on social sectors with particular reference to education and health sectors which account for the bulk of social sector expenditures.

The paper is arranged into seven sections for analytical convenience. The next section briefly reviews country evidence with respect to the impact of adjustment on social sectors with particular reference to south-east Asian countries. Section III outlines the state of human development in India. Section IV explains the concept of 'structural adjustment with a human face' while Section V examines the main proposals of the union budget from this perspective. Since the majority of expenditures on social sectors is incurred by state governments, Section VI examines the trends in their expenditure pattern on social sectors in the light of the financial stringency experienced by them. The last section brings together the main conclusions of the study.

II
Impact of Adjustment on Social Sectors

Measurement of the impact of adjustment on social sectors is problematic for more reasons than one. Firstly, there is generally no definite idea as to what exactly constitutes adjustment and how the identified measures affect social sectors independently of other simultaneous influences [Noss 1991]. Secondly, the impact of measures taken in the education and health spheres is experienced mainly in the long run and evaluations based on a relatively short period of five to 10 years tend to under-estimate the true impact of adjustment. Furthermore, the indicators used to judge education and health development are themselves subject to limitations. For example, the most commonly used indicator in the education sphere is expenditure on education as percentage of GNP. More often than not, it is the pattern of expenditure and the efficiency with which resources are used that influence outcomes to a larger extent than mere quantum or levels of expenditure. In fact, a distinction needs to be maintained between (a) reduction in per capita expenditures, and (b) deterioration in sectoral development. While most 'adjusting' countries have experienced a reduction in per capita expenditures, it is rather simplistic to conclude that, *ipso facto*, there has been a deterioration in social conditions unless corroborative evidence is cited to that effect.

A more fundamental methodological objection to the series of studies conducted in this sphere has been raised by Kakwani et al (1990). They point out that in order to estimate the likely impact of adjustment on social sectors, it would be necessary to arrive at a judgment of sectoral development in the absence of adjustment. While

the importance of counterfactual approach has been stressed, it is not clear what alternative measures would have been adopted in the absence of the IMF-World Bank-sponsored package of measures. Adjustment need not necessarily imply globalisation but could he mainly indigenous in nature Thus while all attempts at comparing the experience of vastly disparate economics is prone to criticism, the comparison of the experience of 'adjusting' countries is even more hazardous.

The above point may hest be illustrated with the help of evidence with respect to the education sector. Sahn (1989) while reviewing the experience of 16 adjusting countries before and after adjustment concluded that adjustment did not reveal any clear impact of the share of education in total budgetary spending of the governments. Kakwani et al (1990) adopt a more sophisticated approach and grouped the countries studied into five categories, depending on the degree of adjustment that a country had experienced. The World Bank (1990) used a three-fold classification, viz, intensely adjusting, others and non-adjusting countries to study the impact of adjustment on various sectors. While Sahn did not find any strong evidence that adjustment affected the education sector, methodologically sophisticated studies of Kakwani et al and World Bank observed that adjustment lending was associated with a declining trend of education financing from public sources. Per capita expenditure as well as gross primary enrollment ratios declined in most of the intensely adjusting countries between 1980 and 1985.

While the evidence on the impact of structural adjustment on social sectors is confusing or even contradictory at times, there are certain conclusions that have emerged unambiguously from the literature which have acquired the status of 'stylised facts' [Prabhu and Kamdar 1993]. We identify some of these below:

(1) The initial conditions, which signify the base from which structural adjustment programmes (SAP) are initiated, and the egalitarian ethos in the concerned countries seem to be crucial in determining the impact of SAP on social sectors. (2) The rate of growth of the economy during 'adjustment' plays a key role in determining the impact of SAP on social sectors. (3) The political commitment to social sector development influences the extent and direction of adjustment to be borne by these sectors.

The evidence from Latin America and sub-Saharan Africa on the one hand and south-east Asia on the other bear ample testimony to the above facts. There is near unanimity in the literature that structural adjustment programmes had adverse effects on the poor in Latin America and sub-Saharan Africa and that low or negative growth rates of the economy resulted in a deterioration in living conditions of the poor in the absence of adequate safeguards to protect the vulnerable sections [Cornia, Jolly and Stewart 1987, Stewart 1992, and Bourguinon and Morrisson 1992]. The south-east Asian experience, on the other hand, has been one where 'adjustment' was accompanied by an improvement in social conditions. An understanding of the factors contributing to such an experience assumes importance for a country seeking to implement structural adjustment with a human face.

There is no denying the fact that favourable initial conditions have eased the path of adjustment in south-east Asian countries. While their success in achieving high rates of growth during a relatively short period of time is highly commended, their pursuit of egalitarian policies and massive and sustained investment in human resource development is often not given due attention. For example, in Korea as well as in Malaysia primary and secondary enrolment rates were over 60 per cent as far back as 1970 [UNDP 1991]. Undernourishment, in terms of shortfall from required caloric intake was marginal In 1965, Korea reported that its population obtained 99 per cent of the required daily caloric supply whereas in Malaysia the percentage was higher at 101 [UNDP 1993]. The Latin American countries, such as Brazil and Mexico, also had high literacy and nutritional levels. However, they lacked the egalitarian policies implemented in Malaysia and Indonesia.

The major distinguishing feature of the two south-east Asian economies has been that they had an ethos of pursuit of egalitarian policies and the adoption of what is now being termed structural adjustment with a human face was a natural extension of this ethos to encompass structural adjustment programmes. This is reflected in the various measures adopted by these two economies much before the need for adjustment arose in early 1980s. The set of measures adopted included higher prices for the principal food crop, rice, empolyment generation programmes and subsidies for agricultural inputs. The combined effect of these measures was an increase in employment, productivity and incomes in rural areas. For the urban poor, the programmes comprised rapid expansion in mining construction, transport and utilities sectors which helped to increase the demand for unskilled labour and considerably raised their income levels. Consequent to the adoption of the above series of well integrated measures, poverty in rural Malaysia declined sharply from over two thirds of rural population in 1970 to a quarter in 1984. In urban areas, the reduction was from 25 per cent in 1970 to 8 per cent in 1980 [Demery and Demery 1991; Bourguinon and Morrisson 1992].

In Indonesia also the emphasis was on raising incomes in the rural sector through structural reforms such as land consolidation, investment in rural infrastructure and subsidies to key agricultural inputs such as fertilisers. The resultant rice boom that ensued helped in reduction of poverty and malnutrition [Thorbecke 1991].

Structural transformation was an important feature of both these economies in the pre-adjustment period. In Indonesia the share of agriculture in GDP (at current prices) declined from 38 per cent in 1973 to 24 per cent in 1980 whereas industry's share increased sharply from 26.5 per cent to 42 per cent. The decline in share of agriculture in national income was accompanied by a similar decline in the proportion of population dependent on this sector from 63.9 per cent to 57 per cent between 1973 and 1980. In Malaysia, between 1973 and 1980, the share of agriculture in GDP declined from 26.4 per cent to 22 per cent while that of industry increased from 27 per cent to 38 per cent, with the share of manufacturing in particular increasing substantially from 15 per cent to 20. 6 per cent between that two time points [World Bank 1991]. A significant feature was the protection of indigenous industry by means of tariffs and quotas which enabled Malaysia to emerge as a leading exporter of labour-intensive manufactured goods subsequently. The creation of more flexible economic structures, expansion of labour-intensive investment programmes and shifting the composition of public expenditure towards sectors that benefit the poor have ensured that vulnerable sections and the quality of human resources embodied therein were protected [Heller et al 1988].

While it has been recognised that high rates of growth of income do not necessarily ensure human development, it has also been realised that the development of social sectors would be a formidable task in the absence of a reasonable rate of growth of the economy [Cornia, Jolly and Stewart 1987]. South-east Asian countries like Indonesia and Malaysia entered the adjustment period with high growth rates of over 7 per cent per annum. While adoption of adjustment policies resulted in the decline of growth rates in both the economics, they remained at over 5 per cent per annum for the period 1980-90, rates which are considered high by international standards for an 'adjusting country' [World Bank 1991]. In sharp contrast to the experience of most south-east Asian countries is the experience of Latin America and sub-Saharan Africa. Most countries have experienced very low (less that 2 per cent) or negative growth rates during adjustment.

Growth rates have significant implications for government expenditures, more particularly for expenditures on social sectors like education and health. Real per capita government expenditure on social services in most of the countries undergoing

adjustment in Latin America and sub-Saharan Africa declined. While social spending as a proportion of non-interest spending remained broadly constant in sub-Saharan Africa during 1980-1987, it fell in Latin America. "The aggregate effect of the fall in total government expenditure per capita in the two adjusting regions, together with the decline in the share of health and education was a decline in social spending per head of 26 per cent in sub-Saharan Africa and 18 per cent in Latin America (1980-5)" [Stewart 1992, p 190].

The impact of political factors on living standards of the poor during adjustment can best be illustrated with the example of Chile. The Chilean case is often highlighted as one in which despite an adverse macro-economic situation and consequent reduction in real per capita social sector expenditure, appropriate targeting ensured protection of the poorest sections of the population [World Bank 1990]. While this is true, it constitutes only part of the story. A peculiarity of the Chilean experience is that government policies benefited the richest and poorest groups simultaneously. Several policies such as preferential rate of exchange to dollar debtors mainly benefited the high income groups even as targeting of subsidies and distribution of food to pregnant women and children under six years of age had a beneficial impact on malnutrition and infant mortality. However, a general impoverishment of families other than those belonging to the poorest sections led to the emergence of sharp class distinctions in the country [Bourguinon and Morrisson 1992]. This shows that while specific targeted programmes are effective, their utility is limited to the short run until more egalitarian policies diffuse the benefits of growth more widely.

The lessons of the brief digression are clear. Human development policies have greater chances of success if implemented as an integral part of development strategy and with full commitment on the part of the government. As the Human Development Report, 1991, observed, "It is too often a lack of political commitment, not of resources, that is the ultimate cause of human neglect" [UNDP, 1991, p 11].

III
Human Development in India

In contrast to the conditions prevailing in Indonesia and Malaysia, the conditions with respect to human resource development in India are appalling. In 1991, the literacy rate in the country was only 52.1 per cent with 324 million in the age group of seven years and above being classified as illiterates. India has the largest pool of children in the world who do not attend school. In 1991 out of 100 million children in least developed countries who were not in school, the bulk, i e, 72.9 million were in India [UNDP 1993]. The drop-out rates at the primary level in 1989-90 at 46 per cent for boys and 50 per cent for girls [IAMR 1993] make a mockery of the 'high' gross enrolment ratios reported. The average number of years of schooling in 1990 was only 2.4 years in India as compared to 8.8 years in Korea and 5.3 years in Malaysia [UNDP 1993]. In terms of health, infant mortality continues to be high at 79 at the all-India level [Government of India 1994] even as under-nutrition is rampant.

The general economic conditions have also not been favourable to the poor. Structural transformation of the economy has remained incomplete with the share of agriculture in Gross Domestic Product having declined drastically from 42.36 per cent in 1970 to 31.8 per cent (at current prices) in 1992-93 [CSO 1994], whereas the population dependent on agriculture has declined only from over 70.7 per cent to 63.9 per cent during 1977-78 to 1987-88.

The share of agriculture and allied activities, irrigation and rural development declined steadily from 24.9 per cent in the First Plan to 20.6 per cent in the Eighth Plan. The reduced emphasis given to the agricultural sector, which is the main source of livelihood of the bulk of the rural population, is also reflected in the deceleration in public investment in agriculture [Rath 1989, Shetty 1990]. Private investment in agriculture is complementary to public investment. There has therefore been a deceleration in agricultural gross fixed capital formation in agriculture in the 80s. The annual compound rate of growth of asset formation in agriculture was 2.57 per cent in the 50s, 4.68 per cent in the 60s and -0.56 per cent in the 80s. The share of gross capital formation in agriculture to gross fixed capital formation declined from 18 per cent in 1980-81 to 9.2 per cent in 1990-91 [Mallick 1993]. The economic reform period has also witnessed a decline in gross capital formation in agriculture, which declined at 1980-81 prices from Rs 4,642 crore in 1990-91 to Rs 4,581 crore in 1991-92 and further to Rs 4,567 crore in 1992-93 [CSO 1994]. The rate of growth in agricultural output has been moderate at the trend rate of 2.6 per cent over the period 1967-68 to 1988-89 despite the 'green revolution' whose impact remained confined to select crops and regions. The agrarian structure has been marked by increasing marginalisation of holdings their share increasing from 56.4 per cent in 1980-81 to 57.8 per cent in 1985-86. Casualisation of labour is also evident with the share of such employment increasing from 31 per cent of rural workers in 1977-78 to 34.7 per cent in 1987-88. While land redistribution is not even considered as a goal any longer, politically less intractable issues such as land consolidation have also not been pursued.

The pattern of growth has not led to increase in employment. In fact, there has been a deceleration in employment growth

TABLE 1: PUBLIC SECTOR OUTLAYS ON HEADS OF DEVELOPMENT

(Rs crore)

rates from 2.10 per cent in 1977-78 to 1983 to 1.77 per cent between 1983 and 1987-88 even after making allowance for the fact that both the years were agriculturally 'bad' years. Despite the implementation of special targeted asset distribution programmes such as IRDP and employment generation programmes such as NREP and several rojgar yojanas in recent times, the proportion of population below the poverty line continues to be high at 38 per cent in 1987-88 [Expert Group of Planning Commission 1993]. The above programmes are, by their very nature, short-term measures and do not constitute a substitute for more broad-based and employment-oriented development strategy. This needs to be stressed as the present emphasis is on initiation of specific targeted programmes for the poor even as the process of liberalisation is pushed ahead relentlessly. The fact is that the poor have neither the skills nor the assets to respond to market signals [Vyas 1993] and hence the developments in the market economy are of little relevance to them. It is in this context that human resource development acquires an overwhelming significance. Having failed to ensure a more egalitarian distribution of productive assets, an improvement in education and skill levels is the only means left to the poor sections to ensure reasonable upward mobility. Human development strategies are important not only for enhancing the quality of human resources but also as a means towards a more egalitarian distribution of income.

Given the importance of human development in the Indian context, it is a matter of regret that the political commitment at the central and state levels has been inadequate. While ritual obeisance has been paid to goals of human development in successive Five-Year Plans, social sectors have been considered as a peripheral welfare activity rather than as the central pivot on which success of all planning rests. The allocations to social sectors have been low[2] and even these have been declining. Table 1 reflects this situation. Ironically, even as the emphasis on human resources development in the plan documents has been increasing, the proportionate allocations made to these sectors has been declining. Despite such proclamations there has been no substantial step-up in allocations for social sectors. As will be observed later, even the plan allocation targets have not been met in actual practice.

Low outlays *per se* need not be a constraint to the achievement of human development goals. As Dreze and Sen (1991) pertinently note, it is the manner in which these outlays are spent and the social, political and economic conditions created that enable the benefits of the programmes to be oriented towards the deprived sections of the population. The examples of Kerala, Sri Lanka and China bear eloquent testimony to the fact that judicious use of limited funds can bring about substantial improvement in human capital.

In the case of India, not only were the public funds available for human development low, they were also allocated in distorted manner. In the case of education this is exemplified by subsidised higher education claiming a larger share of government finances than primary education. The share of primary education in total educational outlay was as high as 58 per cent in the First Plan. This share steadily declined and in the Seventh Plan, the share of primary education was only 29 per cent of the total outlay for this sector. In health, the distorted priorities are reflected in the emphasis given to the creation of expensive curative facilities rather than simple preventive measures. It has been observed that over the plan periods more that 50 per cent of the public expenditure on health services has been allocated to curative health care whereas public health services, which are more relevant to the prevention of diseases, afflicting the poor, received only around one-third of the total expenditure.[3]

This unsatisfactory state of affairs is further complicated by the varying intensity with which human development strategies have been pursued by the state governments. On the one hand, we have the example of Kerala, which has achieved high levels of adult literacy (91 per cent in 1991) and the lowest infant mortality rates (28 per thousand) in the country even with modest increase in per capita income. The long and sustained effort that has enabled Kerala to achieve high levels of literacy, particularly female literacy, is highlighted by Dreze and Sen (1989). The native states of Travancor and Cochin, which together form the preser state of Kerala, had the privilege of havin enlightened rulers who paid a great deal c attention to education. As early as 1817, th ruler of Travancore, Rani Gouri Parvath issued a command that the state should bea the entire cost of education of its people s that there might be no backwardness in th spread of enlightenment among them. Thi was a step in the right direction as "the wid educational base in Kerala seems to hav had a major impact on other public policie in the state, including medical care and foo policy, in addition to encouraging intelli gent health practice at the family level [Dreze and Sen 1989, p 223]. In shar contrast is the case of Punjab where despit a high rate of growth of income, the adul literacy level remains relatively low at 5 per cent in 1991 and the infant mortality rat high at 64 per thousand. The third categor is that of states with a poor record of growt as well as human development. Typica examples are UP, Bihar and Orissa. A pe rusal of Table 2 which presents data on ke social indicators on education and health i the year 1990-91 clearly reveals the differences across states in human development Even more worrisome is the fact that there are very sharp disparities in levels of humar development within states. The distinctly different patterns of development of region within a state are best illustrated by the situation in Maharashtra [Prabhu and Sarke 1992]. A district level Human Development Index constructed for 312 districts of the country for 1981 showed the existence of low human development districts even in better developed states [Prabhu 1992].

TABLE 2 SOCIAL INDICATORS AT STATE LEVEL

State	IMR (1990)	Life Expectancy Combined (1981-86)	Adult Literacy (Per Cent) 1991	Female Literacy (Per Cent) 1991

It is in this context that the development strategy articulated in the Eighth Plan which will be in operation over the 1992-97 period assumes importance. The Eighth Plan marks a noticeable shift in the approach of Indian planning towards human development. In sharp contrast to its earlier approach of treating provision of basic needs as a welfare activity, the plan document recognises that they contribute positively to development of human capital. The importance given to human development in the plan may be gauged from the following statement. "Human development will be the ultimate goal of the Eighth Plan. It is towards this that employment generation, population control, literacy, education, health, drinking water and provision of adequate food and basic infrastructure are listed as the priorities. The provision of the basic elements, which help development of human capital remain the primary responsibility of the Government of India" [Planning Commission 1992, p 16]. However, the macro-economic adjustment programme initiated in mid-1991 and the consequent financial stringency threatens to thwart the initiatives undertaken in the plan as is evident from the fact that allocations to education and health in 1992-93 and 1993-94 have been lower than the plan target (Table 1).

The relatively low level of human development, the wide disparities across states, the declining share of plan outlays devoted to human development and the distorted pattern of allocation of scarce resources form the backdrop against which the government of India is attempting to achieve structural adjustment with a human face. While this term has been bandied about a great deal, its exact elements are not widely known. The next section is devoted to an understanding of the concept.

IV
Elements of New Concept

The decade of the 1980s witnessed the phenomenon of a record number of countries in Latin America and sub-Saharan Africa undertaking stabilisation and structural adjustment measures with the active support of the IMF and World Bank. The worsening of the condition of the poor during adjustment in several countries drew the attention of policy-makers to the need for incorporating redistributive measures in the adjustment policy. Observers such as Cornia, Jolly and Stewart (1987) began to pressurise the international financial institutions to evolve structural adjustment with a human face, a concept which emerged in 1985-86 and gained acceptance in 1986-87. These economists argued that adjustment is a long-term process, the benefits reach the poor only after a long time and hence social or redistributive policies must be adopted to reduce the interim social costs. 'Adjustment with a human face' calls for required adjustment to be implemented with the minimum harm to the most vulnerable groups such as children and women [Streeten 1987]. Arguing for 'adjustment with a human face' UNICEF (1987, p 2) pointed out that "policies which undermine a nation's most valuable services—its human resources—weaken its future economic capacity".

Cornia, Jolly and Stewart (1987, pp 134-35) list out the main elements of such a strategy that must be undertaken by the governments once there is an explicit acceptance of the objective of structural adjustment with a human face. These are reproduced below.

(1) Adoption of macro policies which are more expansionary with a view to sustaining levels of output, investment and satisfaction of human needs over the adjustment period and gradually moving to acceleration of development.

(2) Meso policies[4] which are designed in such a way as to fulfil priorities in meeting the needs of vulnerable groups and producing economic growth in the context of limited resources must be adopted. In view of the resource constraint it is necessary to improve the allocation resources. Therefore, prioritising, selectivity, redistribution and restructuring are essential aspects of achieving adjustment with a human face.

(3) Implementing sectoral policies which achieve restructuring in the productive sector within any aggregate level of resource availability. This involves promoting opportunities, resources and productivity in the small-scale sector both in agriculture and in industry and services.

(4) Designing and implementing policies that increase the equity and efficiency of the social sector by redirecting effort and resources from high cost areas which do not contribute to basic needs towards low-cost basic services and by improving targeting of interventions. This implies active support for a new range of initiatives which mobilise people for health and education, and for greater community action in such areas as housing, water and sanitation will often need to be part of this.

(5) Devising compensatory programmes to protect the basic living standards, health and nutrition of the low-income during adjustment, before restructuring of production and economic growth have raised output and incomes sufficiently to enable the most vulnerable to meet minimum acceptable standards. While appropriate design for compensatory programmes depends on country circumstances, the two major elements in all such programmes are emergency public works employment schemes to sustain incomes through employment, and nutrition interventions, encompassing targeted food subsidies and direct feeding for the most vulnerable.

(6) An important element is monitoring of the living standards, health and nutrition of the vulnerable during adjustment. Such monitoring needs to be on a regular basis (quarterly for some items as with much economic data), and processed speedily so that progress can be assessed and design of programmes modified accordingly. Monitoring of the human dimension should be given at least as much weight as monitoring monetary variables has in the usual approaches to adjustment.

The actual package comprising the main elements of adjustment with a human face would vary from country to country depending on the structure of the economy, characteristics of the vulnerable sectors and so on. Cornia et al point out that whereas the IMF approach to adjustment concentrated on re-

storing balance at the aggregate level leaving meso implications to fall out from the existing system, the alternative approach in sharp contrast includes meso policies as an integral part of adjustment policies even as the importance of restoring macro balances is not undermined. The adoption of this alternative strategy therefore implies that appropriate measures need to be devised and implemented as an integral part of the reform process rather than as 'add on' component subsequently when the adverse impact of the reforms have already caused considerable damage.

V
Union Budget 1994-95

The main feature of the budget proposals for 1994-95 is the adoption of a more expansionary policy by the government. The revised estimates for 1993-94 deviate substantially from the budget estimates presented. There has been a shortfall in total revenues to the extent of Rs 7,803 crore even as expenditure exceeded budget estimates by a whopping Rs 12,549 crore. Consequently the gross fiscal deficit has exceeded the budget estimate by Rs 21,952 crore to touch Rs 58,551 crore, 7.4 per cent of GDP. This is much higher than the 4.6 per cent deficit that was visualised in the budget estimate. More pertinent is the fact that the revenue deficit which was expected to be pegged at Rs 17,630 crore (2.2 per cent of GDP) almost doubled to Rs 34,058 crore (4.3 per cent of GDP).

The 1994-95 budget proposals do not attempt any substantial reduction in the deficit as the targeted figure of Rs 54,915 crore constitutes 6.1 per cent of GDP. Given last year's experience of considerable laxity in fiscal discipline, a repeat performance in the coming year should not come as a surprise.

The relatively expansionary policy, it is claimed, is a deliberate move to stimulate growth in the economy. This measure apparently also is in keeping with the requirements of adjustment with a human face. However, the similarity is only at the superficial level. The expansionary policy advocated by Cornia et al is one that leads to sustaining of investment and output levels and enhancing the productive capacity of the economy. The current fiscal gap in India is more on account of the burgeoning revenue deficit due to uncontrolled increase in expenditure. The strategy of the government has been to use the surplus on government's capital account to finance its revenue deficit.

The compression in expenditure at the central level has affected capital expenditure which has declined even in nominal terms in most years since 1990-91 (Table 3). In 1991-92, aggregate capital expenditure in nominal terms declined from Rs 31,782 crore to Rs 29,121 crore, i e, a decline of 8.4 per cent. While the expenditure recovered marginally to Rs 29,916 crore in 1992-93 (increase of 2.7 per cent), the budget estimates for 1993-94 indicated a marginal decline of 1.4 per cent. The revised estimates of 1993-94 however show an increase of 12.5 per cent over the budget estimates. The 1994-95 budget estimates once again indicate a decline of 2.3 per cent in the aggregate capital expenditure of the central government. The overall trend has been one of axing capital expenditure which does not augur well for maintaining, let alone enhancing, the productive capacity of the economy.

One welcome feature of the current budget is the fact that there is a substantial increase in allocations proposed for social sectors in nominal terms (Table 4). This is perhaps in response to the concern expressed in various quarters regarding the budgets since 1991-92 that the allocations to social sectors in real terms may have declined. The allocation for education (including art and culture) has been budgeted at Rs 1,749 crore which constitutes an increase of 15.67 per cent over that of the previous year. Moreover, the emphasis within the education sector is to be on elementary education and increased central support to library facilities. The health and family welfare outlay has increased from Rs 1,780 crore to Rs 2,008 crore. The health outlay has been raised from Rs 506 crore to Rs 578 crore (14.23 per cent increase). Within the health sector, blindness eradication, leprosy and AIDS prevention are to be emphasised. Family welfare would receive increased allocation from Rs 1,274 crore to Rs 1,430 crore, an increase of 12.24 per cent over the previous year. Several employment programmes have also received enhanced allocations, e g, the employment assurance scheme announced by the prime minister on August 15, 1993, which is being implemented in 1,752 identified blocks of the country would receive an allocation of Rs 1,200 crore; National Renewal Fund's allocation increased by Rs 320 crore taking the total to Rs 1,020 crore. The latter scheme benefits mainly organised sector employees as it is meant for funding of voluntary retirement schemes in public sector undertakings and financing of training and counselling.

While not discounting the above positive features of the proposed central government expenditures, the following facts need to be borne in mind in order to arrive at a realistic assessment of their impact on human development.

(1) The central plan outlays on major social services has increased slightly from 3.4 per cent of GDP in 1990-91 to 4.4 per cent of GDP in 1993-94 (BE). However, revised estimates for 1993-94 show that the share was only 4 per cent of GDP. In 1994-95 (BE) though there was an increase in share to 4.3 per cent this is lower than the budget estimates of 1993-94.

(2) More importantly, the bulk of expenditure (80 to 90 per cent) on education and health is incurred by the state governments. Ironically, in the case of education, which is on the concurrent list, the central government's participation is much more limited than in the case of health which is a state subject. In the case of education, in 1990-91 (Accounts), the revenue expenditure of the central government was Rs 1,274.54 crore which constituted only 8 per cent of the total revenue expenditure incurred by the central and state governments on this sector. It is estimated that in

the health sector, the central government financed around 11 per cent of the total expenditure on medical and public health in the country in 1992-93 while the share of the states was as high as 89 per cent [Tulasidhar 1993]. World Bank estimates place the share of the central government higher at 27.4 per cent in 1991-92 [World Bank, 1993]. The central support to the health sector is mainly in terms of financial support to medical education and research, centrally sponsored programmes, central government health scheme and the family welfare programme. Under the circumstances, the role of the central government may be seen more as one of indicating priorities and providing leadership in the field rather than one of deciding upon allocations and actually incurring the said expenditures.

The thrust of the above arguments is that while changes in the centre's financing of the social sectors as observed in the current budget proposals are welcome their impact is at best symbolic as it is the states which incur a major proportion of the expenditure on these sectors. Hence the financial position at the level of the states' and their commitment to social sector development are crucial determinants in achieving 'Structural Adjustment with a Human Face'. The next section is therefore devoted to an examination of these issues.

VI
State Level Expenditures

The impact of the resource crunch at the central level has resulted in a decline in the share of developmental expenditure in the total expenditure. The share of developmental expenditure declined from 54.3 per cent of total outlay in 1990-91 to 48 per cent in 1993-94 (BE) (Table 5). At the states' level the decline has been from 68.8 per cent to 64 per cent during the same period. When the developmental expenditure by the centre, states and union territories is considered, the decline continues to be quite sharp from 58.8 per cent to 52.9 per cent between 1990-91 and 1993-94.

The financial stringency at the central level has also had its repercussions on state finances which were already under considerable pressure since the mid 1980s. As the *RBI Bulletin* of October 1993 remarks, "The consolidated position of the finances of state governments during 1993-94 indicates an accentuation of the imbalances in their budgetary operations as revealed by the major deficit indicators" [RBI 1993, p 1285].

The gross fiscal deficit of states which rose by 5.8 per cent in 1992-93 increased further by 18.6 per cent in 1993-94 leading to an increase in the ratio of gross fiscal deficit to GDP from 2.8 per cent to 3 per cent. While the gross fiscal deficit of the states is lower than that of the central government, the worrying aspect is that for the seventh year in succession the consolidated financial position of the states shows a deficit on the revenue account [RBI 1993].

As mentioned earlier, the resource crunch has affected the developmental expenditure of the states. Along with the above trend is also observed a consistent pattern of shortfall in actual plan expenditures from approved outlays (Table 6). In real terms plan expenditure has been declining at least since 1990-91. Along with the decline in plan expenditures, there has also been a reduction in the share of expenditure on social services. The share on social services in total plan outlay of centre, states and union territories has declined from 16.5 per cent in 1990-91 to 15.4 per cent in 1993-94. These shares are also lower than the Eighth Plan target of 18.2 per cent in total plan outlay. Given the fact that for the first time in the history of planning in India human development has been made 'the ultimate goal', it is ironical that the share of these very sectors in the total plan outlay has suffered a decline. Thus the allocations to the social sectors are doubly disadvantaged. Not only is there a shortfall in actual total plan expenditures at the state level from those approved, there is also a reduction in the lower outlays for the social sectors. The financial position of the states has much to do with this phenomenon as the bulk of expenditures on social sectors is incurred by the state governments. The situation for 1994-95 is not clear as the budget documents of all the state governments are yet to be analysed. However the situation is not likely to be different from the earlier years in view of the financial stringency that continues to affect the states and the proposed reduction of Rs 1,341 crore in net resources transferred to states in 1994-95 (Table 7).

A combination of circumstances have contributed to the acute financial crisis of the state governments. In the recent past the states have had to suffer a decline in their share in central taxes as well as non-plan grants from the centre. The gross devolution of resources from the centre have decelerated significantly since 1991-92. The growth rate in tax revenue decelerated from 21.5 per cent in 1992-93 to 7.1 per cent in 1993-94 whereas the growth rate for grants declined from 20.6 per cent to 2.9 per cent during the same period [RBI 1993]. The centre has embarked on a course of reducing/surrendering revenues in which states have a share. The centre's policy has also made small savings, which were a major source of borrowings at the states' level, less attractive.

While the centre has tried to compensate for the decline in tax and non-plan grants by substantially increasing the loan component, its impact is reduced by simultaneously increasing the rate of interest on such loans. The rate of interest on central loans has been continuously revised upwards and at present carry an interest rate of 12 per cent. There has also been a step-up in the market rate of interest on borrowing of the states to 13.5 per cent.[5] The sharp increase in interest burden of the states is evident from the fact that it is estimated to rise from Rs 9,694.81 crore in 1993-94 (RE) to Rs 11,126.50 crore in 1994-95. Furthermore, the continuous upward revisions in dearness allowance and other benefits to central government employees have forced the state governments to follow suit thereby contributing substantially to a rise in their administrative expenses.

The devaluation of the rupee in mid-1991 has also contributed to a sharp increase in the rupee costs of state level projects. In fact the centre has had to enhance the budgetary support to plan expenditure to states on the current year from Rs 41,251 crore provided for in the budget estimate to Rs 46,026 crore, i e, an increase of Rs 4,775 crore. Of this as much as Rs 3,493 crore was intended as assistance to the states for financing their plans. The finance minister in his budget speech has explicitly stated that a large part of this amount relates to externally-aided projects (p 11, Part A of Budget Speech).

Analysis conducted earlier indicates that financial stringency severely affects the states' expenditures on social sectors [Prabhu and Chatterjee 1993]. It was observed that between 1974-75 and 1991-92 there was an increase in the real per capita total expenditure (RTE), real per capita social sector expenditure (RSE), real per capita education expenditure (REDN) as well as real per capita medical and public health expenditure (RMPH). However, an analysis of the growth rate of these four categories of expenditures between two sub-periods, viz, 1974-75 to 1984-85 and 1985-86 to 1991-92 revealed a sharp deceleration in all categories of expenditure in the second sub-period except for REDN in some states. The impact of the deceleration was on RSE, whose rate of growth declined sharply during the second period in all states. Within the social sectors the decline in the growth rate was experienced to a greater extent by MPH where all the 15 states experienced sharp deceleration in growth rates with as many as six states recording negative growth rates. In the case of REDN, the growth rate declined in as many as nine states. There was a step up in growth rates in REDN in Madhya Pradesh, Orissa, Punjab, Rajasthan, Tamil Nadu and Uttar Pradesh [Prabhu and Chatterjee 1993]. Considering the general deceleration in RSE and a very sharp deceleration in RMPH in the above states, it seems probable that the expenditures on education have been enhanced at the expense of the expenditures on health. Given the synergistic relationship between education, health and nutrition, the above short-sighted policy, to say the least is, self-defeating in nature.

The above situation, it must be recalled, was in the context of financial stringency at the level of the states and not at the centre. The sectors that where the centre's contribution was significant therefore escaped a cut. In fact, preliminary analysis of the trends in revenue and capital expenditures in the health sector in Maharashtra indicates that capital expenditure was relatively protected as compared to revenue expenditure [Prabhu 1994]. The current scene is however one of fiscal stringency at both the central as well as the state levels and its repercussions could be more damaging than in the earlier period. Additionally, the centre is keen on relegating the responsibility in the education and medical spheres to the private sector, including voluntary agencies, in the belief that this will improve the efficiency with which services are provided.

Some preliminary exploratory analysis conducted for the years 1991-92-1993-94 with respect to education, health and social services for four states provides interesting insights in this regard. Pending the publication of the Reserve Bank of India's data on state finances for the years 1992-93 (revised estimates) and 1993-94 (both budget and revised estimates), an attempt has been made to compile the data from individual state

TABLE 8: PER CAPITA SOCIAL SECTOR EXPENDITURES AT STATE LEVEL: SELECT STATES

States	Education		Medical and Public Health		Family Welfare		Water Supply and Sanitation		Total Social Services

Notes: (1) Ac = Actuals; BE = Budget Estimates; RE = Revised Estimates; (2) Per capita total expenditures include Revenue and Capital Expenditures in case of Education, Medical and Public Health and Family Welfare; (3) Per capita total expenditures include Revenue, Capital Expenditures and Loans and Advances in case of Water Supply and Sanitation and Total Social Services (Cols 9 and 11); (4) Total social services include Housing and Urban Development, Information and Publicity, Welfare of SC, ST and OBC, Labour and Labour Welfare, Social Security and Welfare, Nutrition, Expenditure on National Calamities, other Social Services and Secretariat Social Services in addition to the categories mentioned above; (5) Figures in parentheses indicate growth rate (percentage) over the previous year; (6) Deflated Using Consumer Price Index for Industrial Workers (1982=100).

Source: Annual Financial Statements of Respective State Governments, 1993-94 as laid before the parliament.

budget documents for the respective years. While all possible care has been taken to confirm to the RBI classification of expenditures, it is likely that the figures compiled by us may not exactly tally with those of RBI due to inclusions/exclusions of some minor items of expenditure. Hence, our data must be viewed as approximations of the trends and are strictly provisional in nature. The emphasis therefore is more on the direction and extent of change rather than on absolute numbers.

The data pertain to four states, viz, Punjab, Maharashtra, Tamil Nadu and Uttar Pradesh. The four states represent four typologies of social sector development. Punjab, despite being the state with highest per capita income has lagged behind Kerala in crucial human development indicators though in recent years it has stepped up efforts in this regard. Maharashtra is a state with identical ranking in per capita SDP and human development, ranking third among 15 states in both respects [Prabhu and Chatterjee 1993]. The intra-sectoral allocations in both the education and health sectors however reveal a clear bias towards higher level facilities. The state is also characterised by sharp regional disparities in its development [Prabhu and Sarker 1992]. The state of Tamil Nadu, despite its ranking seventh among 15 states in terms of per capita SDP in 1990-91, recorded per capita expenditures on par with that of Maharashtra and even Punjab in some aspects. Moreover, a larger proportion of these expenditures is directed towards items of social priority such as elementary education, preventive health care, nutrition and water supply and sanitation. In recent years, the state has been in the forefront of implementing innovative social welfare schemes which reflects a strong political commitment to the cause of the poor [Guhan 1992]. Finally, Uttar Pradesh represents a state with low level of per capita income as well as low level of human development. The state ranked 12 in terms of per capita SDP and 13 in terms of human development.

The per capita state government expenditures on education and health for the years 1991-92 to 1993-94 are presented in Table 8. As may be observed almost the entire expenditure incurred is on revenue account with capital expenditure being negligible in all states. The annual growth rates in social services expenditure were higher between 1991-92 and 1992-93 than for the later year, i e, 1992-93 to 1993-94 in all states except in Punjab where there was a marginal step-up from 11.99 per cent in 1991-92-1992-93 to 12.16 per cent in 1992-93-1993-94. The state of Tamil Nadu has been able to maintain an annual growth rate of over 4 per cent in real per capita expenditures on social services despite a severe resource crunch. In Uttar Pradesh, a state where the per capita social sector expenditure is half or even less than half of the expenditure incurred in Punjab and Tamil Nadu, the rate of growth fluctuated sharply between the two years. The allocations to family welfare and water supply and sanitation seemed to have suffered an absolute decline in real terms in 1993-94 as compared to the previous year. In Maharashtra also per capita revenue expenditure on social services in general, and education and water supply and sanitation in particular, declined in 1993-94 as compared to 1992-93. The per capita expenditure on medical and public health also was marginally lower in 1993-94.

The above brief analysis of the trends in social sector expenditures reveal the complex nature of responses to the structural adjustment programme among Indian states. The expenditure pattern in Tamil Nadu seems to contradict Ravallion and Subba Rao's (1992) observation that social sector allocations improved in states where internal financial discipline was maintained. In the past, it was observed that in states with the lowest debt service ratio, there has been a steady increase in government spending on social sectors. This was particularly true in case of states ruled by opposition parties. Tamil Nadu seems to be able to maintain its social sector commitments despite acute resource crunch. The question that inevitably crops up in this context is whether such spending can be sustained in the long run in the absence of either a high rate of growth of the state's economy or a substantial step-up in additional resource mobilisation efforts.

We had argued earlier that low per capita expenditure *per se* do not lead to poor outcomes. It is the pattern of expenditure and the efficiency with which these expenditures are incurred that is crucial in determining the level of human development. Some evidence of the distorted pattern of expenditure was presented in Section III. The intra-sectoral allocations in education and health in the years 1985-86 and 1991-92 for 15 major Indian states confirm the observations made at the aggregate level and provide adequate evidence that there has been no change in the pattern of expenditure on these sectors.

The share of expenditures incurred on elementary education, on an average, was around 50 per cent in 1985-86 and 1990-91 though in some states there was an increase in share for this sector across the two time points. In the case of health, public health expenditures accounted for, on an average, only 12.6 per cent of total expenditure on the sector in 1985-86. However, by 1990-91, even this meagre share declined to 10.6 per cent. As many as 13 states reported an increase in the share of medical expenditures between 1985-86 and 1990-91 [Prabhu and Chatterjee 1993].

The current fiscal crisis offers an excellent opportunity to restructure the entire education and health systems. The response of the government at the centre as well as the states thus far has been to resort to *ad hoc* measures with allocations fluctuating from year to year. The evidence from the health sector financing at the central level indicates that the expenditures on disease control programmes, which are essentially in the nature of preventive health spending, have been cut even as medical expenditure on facility-based disease control programmes suffered minimal cuts [Tulasidhar 1993].

There is no evidence either of increase in efficiency of spending. The expenditures in these sectors have been predominantly revenue expenditure, the bulk of which is preempted by the salary component leaving very little for commodity purchases. The impact of such distorted priorities on the quality of services provided at public institutions is too well known to need repetition. The curious phenomenon of unutilised health and education services at the village level bear testimony to the lack of faith of the people in the very institutions created to serve them. In the case of the health sector only 8.2 and 5.8 per cent of all illness episodes in rural and urban areas respectively were referred to the primary health centres [NCAER 1992]. In education, it was reported in the 42nd Round of the NSS that in 1986-87, 30 per cent of children never enrolled in schools had cited 'not interested' as the cause for non-enrolment (NSS). Commenting on this, Minhas (1991, p 5) states, "Although the non-interest in enrolment might be considered a demand side constraint on access to education by many, I am of the view that the main cause for being 'not interested' in enrolment may reside in the lack of facilities... In other words, it is not only the physical non-availability of schools as such but also the poor quality of what is available".

It has been observed that when faced with expenditure compression on the one hand and increasing socio-political pressure for educational expansion on the other the governments tend to trade off quality for quantity [Tilak 1993]. Commenting on the impact of the structural adjustment programme on the educational sector Tilak states, "First, quality of education gets traded off for quantitative expansion. The policy-makers find a compromise solution of apparent maintenance of the *status quo* by meeting the quantitative demand fairly satisfactorily but by diluting the quality of education, with inadequate allocation of physical and monetary resources for programmes and objects relating to improvement in quality..." (p 136). Special efforts need to be taken to ensure that the low quality of services provided do not deteriorate further.

Conclusions

The structural adjustment programme in the country is being implemented against a background of incomplete structural transformation, high-level of poverty, low level of human development and distorted patterns of expenditure in education and health which are attuned more towards higher level facilities as compared to primary level institutions. Complicating the issue further is the fact that the bulk of expenditures on social sectors is incurred by the state governments which have pursued human development strategies with varying degrees of intensity. Given such dismal initial conditions and a low rate of growth of the economy in the past three years, the pursuit of 'structural adjustment with a human face' depends to a very large extent on the prioritisation of goals and the degree of political commitment at both the centre and the states' level. Such a strategy requires the adoption of a series of measures of which financial allocations form only one of several equally important elements. The crux of the matter is that the approach requires human development goals to be an integral part of the strategy of structural adjustment as well as development.

While not undermining the new initiatives taken so far at the central level, it needs to be pointed out that development of these sectors is a long and arduous task and sustained effort in this direction over a long period of time is essential. Given the responsibility of the states in this regard, the present situation wherein the financial allocations keep fluctuating in view of the fiscal exigencies do give an impression of the lack of a long-term perspective in this regard. The present tendency is to initiate several rather conspicuous social welfare programmes without adequate planning or preparation at the ground level. Further the implementation of individual social welfare schemes is being interpreted as adhering to the concept of adjustment with a human face. As it was repeatedly stressed earlier, the concept implies that the bias towards the poor is to be built in to all measures taken by the government and its responsibility does not end with the initiation of specific schemes. What is necessary is the identification of various components of an integrated human development strategy and implementation of projects with appropriate sequencing so as to yield maximum social returns. Furthermore, given the synergistic relationship between education, health and nutrition, the measures adopted in the past in some states of accelerating expenditures on education even as the health sector's allocations suffer needs to be curbed.

In a country of India's size and diversity there are limitations to what the governments even with the best of programmes can achieve. The participation of the people, particularly women and the adoption of community approach are imperative if the success of social sector programmes is to be ensured. Recent examples from Tamil Nadu in the field of social welfare programmes bear ample testimony to this. The adoption of the structural adjustment programme, to use a cliche, offers both a challenge and an opportunity to overhaul the system that organises and delivers social services. The enhancing of allocations at the central level could, at best, serve as a signal to the states to follow similar policies. However, the other elements of the strategy of structural adjustment with a human face which involve, *inter alia*, prioritising, reorganisation and targeting, ensuring equity and monitoring (possibility every quarter) of human development outcomes during structural adjustment programme needs to be given top priority at the highest level. The sheer magnitude of the problem involving over 300 million people below the poverty line and 324 million illiterates demands an immediate and sustained response from the government. The stakes are too high and the magnitude of the problem too large to be swept under the carpet. The repercussions of failing India's vulnerable sections could trigger off responses which may seriously undermine the very sustainability of reforms. It is in the enlightened self-interest of all concerned to adopt structural ajustment with a human face whole-heartedly and with all its implications.

Notes

[Extensive discussions with S L Shetty and Romar Correa helped me a great deal in the preparation of this paper. Sangita Kamdar and A Radha compiled data from state budget documents and provided valuable research assistance. N V Ramaswamy, in his usual efficient manner, transformed an untidy manuscript to a neat final copy in record time. My gratitude to each one of them. The usual caveat applies.]

1 There have been several criticisms of the methodology adopted by the UNDP for constructing the Human Development Index. Criticism has been on choice of indicators, weights given to the indicators as well as on the utility of such an index [Bhanoji Rao 1991, McGillivray 1991, Prabhu and Sarker 1994]. For the present purpose, it will suffice to recognise its utility as a crude indicator of human development across countries.

2 The allocations to education and health are at par with the average levels in other Asian countries and hence considered adequate by studies conducted at the World Bank [Griffin 1992, Tan and Mingat 1992]. However, in view of the low level of human development and the large magnitude of the task, a higher allocation of at least 6 per cent of GNP is recommended by experts [Bhanoji Rao 1992] as well as official bodies [ICSSR-ICMR Joint Panel 1981, Government of India 1986, Planning Commission 1992).

3 Private expenditures on health are high and are estimated to account for as much as 75 per cent of total expenditure on health in the country (World Bank 1993). The high level of private expenditure in the context of low incomes and widespread poverty indicates that expenditures are diverted from essential consumption to unavoidable curative medical care [Griffin 1992]

4 Van Der Hoeven (1991) defines meso policies as those that "deal with the consequences of macropolicies on special groups, the poor in particular. They encompass, the way taxes are collected, government expenditure is distributed, and how credit and interest rate policies, etc, are carried out in practice" Meso policies rely more on direct government intervention rather than on market forces.

5 The rate of interest on small savings loans was 13.5 per cent from June 1, 1991, was raised to 14.5 per cent from June 1, 1992, 15 per cent from June 1, 1993. The rate of interest on other plan and non-plan loans was raised to 10.75 per cent from June 1, 1991 to 11.75 per cent from June 1, 1992 and from June 1, 1993, these loans carry an interest rate of 12 per cent [Receipts Budget 1994-95].

Gender and Structural Adjustment

LETTERS TO EDITOR

Rajya Sabha

WHILE wading through the back numbers of *EPW*, my eyes got stuck at the note in the issue of January 22 last by a correspondent on the country's electoral law, 'Straining Credulity', and which you have accorded the prerogative of carrying on the editorial pages (pp 144-45). The writer of the note is obviously either unaware or contemptuous of the original purpose underlying the establishment of the Rajya Sabha. While the Lok Sabha (the House of the People) was supposed to concern itself with national issues, the Rajya Sabha (the Council of States) was intended to concentrate on specific issues pertaining to the constituent States of the Union of India. Those hating the very concept of a federal structure for the country, and whose objective is to render the polity into an increasingly centralised, increasingly authoritarian entity, have tried to subvert with great diligence the legal provision that members representing a particular State in the Rajya Sabha should be ordinarily resident in that State. I am sorry that the *EPW* has seemingly decided to join this crowd.

Calcutta

Ills of University Education

AMRIK SINGH (March 19) while outlining the ills afflicting today's Delhi university education, has taken up only such issues as colleges not being granted autonomous status, underutilisation of existing infrastructure facilities like building and laboratories, the obsolescence of undergraduate course curriculum, the implementation of the 10+2+3 system. And it escapes all logic why he conveniently puts the blame on the Delhi university teachers for all these problems. For Amrik Singh, no other problems and issues need attention

It is too simplistic to say that "universities exist for the students and everyone else is there because the students are there". The nature of education imparted is determined by the goals with which the universities are established. The universities exist to serve the economic goals of the nation state. In the Indian context university education has outlived its post-independence objective of a liberal basic education in science and social science for the masses when the existing economic structure cannot even give a minimum social security. The crisis in university education reflects the crisis in society—the crisis of bourgeoisie democracy crying for a change. At this juncture to live with this crisis, the Indian university education can only dismantle the existing nature of education it imparts and this is what Amrik Singh is proposing in the guise of his 'concerned' opinion. And in doing this, the strongest opposition surely will come from the organised teaching community despite its current BJP affiliations! However, people like Amrik Singh exist in all spheres of our society, they are the entrepreneur managers, who come forward with a detailed blueprint and justification sensing the changing wind and thereby keeping themselves eternally available for 'his/her majesty's service'. The concern shown by Amrik Singh at the state of university education in Delhi is made at a time and in circumstances when it is considered radical to be a conservative and prescribe solutions in the language of the concerned liberal that are already being put into action under the current liberalisation regime.

In Khalsa College, of which Amrik Singh was till recently chairman, teachers have a court case against the minority status of the college. Amrik Singh is not a stranger to the harassment and politics of interference from the Gurdwara governing body members (all of them being 'jathedars' and semi-literate at best) in many day-to-day affairs over the years, that this minority/autonomous status afforded them. Yet for him the autonomy of the institution is a sacred objective against which the teachers surely are creating hurdles. Similarly, other Delhi university colleges are run by partisan governing bodies and any discussion on autonomous status should in all sincerity focus on the nature of autonomy sought rather than on whipping the teachers.

This is not to say that the Delhi university teachers have conducted themselves in the most exemplary manner and that merit not be a criteria for academic evaluation. Indiscipline, misbehaviour and dereliction of duty cannot be overlooked. Yet merely harping on this will not do and before solutions are sought, the reality needs to be understood. University teachers, like the public sector workers, are working in the overall cultural and social environment where working for individual interests is considered to be the best for the competitive capitalist environment. In the absence of an alternative ideology and culture, work in the public utility services including teaching in public institutions assumes an odour of charity. In the absence of a strong working class movement and a social philosophy, corruption thrives even amongst the working class. This is a reflection of the overall degenerating capitalist environment. It is contingent upon the teaching community to understand that their future lies with the working class struggle seeking through a revolutionary change in the existing social structure and not in begging for more. Being teachers, they are responsible for keeping the intellectual climate free from reactionary and idle phrasemongering—if they fail it is not only their misfortune but of the nation too.

ECONOMIC AND POLITICAL WEEKLY

Whistling in the Dark

IT would not be wide of the mark to say that the authorities are sitting on a volcano of macro-economic instability and possible hyperinflation. But judging by their actions, they do not seem to be aware of this. Worse, the framework of their economic policies leaves them with very limited options in dealing with the situation.

The macro-economic situation, both current and prospective, is fraught with imbalances and uncertainties: low real income growth, fiscal instability, rapidly expanding monetary liquidity, reduced domestic saving and investment, poor addition to employment and a combination of supply shortages, manipulative supply management, rampant speculation and upward revision of administered prices which is stoking inflation. On the surface there are no doubt positive elements like the large reserves of foreign exchange and foodgrains which should help augment commodity supplies; but in the first place, they themselves have been acquired with policy instruments that have strong inflationary bias and, secondly, their effectiveness in restoring macro-economic balance will depend upon the short- and medium-term strategies for deploying these assets effectively to break the back of speculation in commodities and to expand the economy's production base. On both counts the government's actions do not inspire much confidence.

It is significant that both the large foreign exchange accruals and the build-up of foodstocks with the public procurement agencies took place in the second half of 1993-94 and were accompanied by a triggering of inflationary expectations. In the first quarter of 1993-94 the annual inflation rate had hovered around 7 per cent and there had been a seasonal spurt to above 9 per cent in the second quarter and a slight seasonal decline to approximately 8 per cent in the third quarter. In the last quarter, however, reports of bulging of foreign exchange reserves and of food stocks with public agencies coincided with the revival of inflation. As a result the fiscal year 1993-94 ended with a rise of 10.2 per cent in the wholesale price index (base: 1981-82=100) against 7 per cent in the previous year and the government's original target of 6 per cent. In fact, when the final figures of the WPI become available, the year will be seen to have experienced an inflation rate of over 11 per cent. Further, even this measure of inflation should be considered an underestimate as the general index of wholesale prices does not fully capture either the galloping rise in prices of commodities of common consumption or the rising cost of investment, both of which have significant macro-economic implications.

Prices of a large number of commodities of common consumption have risen sky-high. In 1993-94, the WPI for foodgrains shot up by 16.1 per cent with cereals rising by 13.7 per cent and pulses by 30 per cent. Sugar, khandsari and gur prices rose by 20.9 per cent, cotton textiles by 17.5 per cent, drugs and medicines by 10.8 per cent and electricity by 30.7 per cent. The price increases for specific commodities available for the period February 1993 to February 1994 are mindboggling: rice 12.1 per cent, wheat 22.3 per cent, bajra 37.7 per cent, maize 28.9 per cent, barley 41.9 per cent, gram 63.1 per cent, arhar 11.6 per cent, moong 25.4 per cent, urad 21.8 per cent, potatoes 11.9 per cent, onions 20.7 per cent, green peas 17 per cent, eggs 16 per cent, non-levy sugar 34 7 per cent, khandsari 26.2 per cent and gur 30.4 per cent. The underestimation of the price increases occurs because at the level of the individual items, unweighted averages of price quotations are taken into account. The understating of the inflation in cost of investment arises similarly because the WPI does not reflect the increase in the cost of land and of raising capital from the market. As is well known, land values have risen tremendously in the past two years or so after non-resident Indians (NRIs) and even foreign nationals were permitted to buy real estate in India, though on a non-repatriable basis.

Besides, it must not be lost sight of that the inflation of 7 to 10 per cent last year coincided with low growth of the economy brought on essentially by fiscal compression. While the fiscal contraction could not contain the pressures on commodities of common consumption because of the unrestrained current consumption expenditures of the central and state governments and also because of the speculative manoeuvres of the trade and rich farmers, prices of capital goods have been held down due to the industrial recession attributable to the sharp cut-back in the government's capital expenditures. Studies have suggested the strong possibility of a trade-off between inflation and growth. In any case, the link between the government's capital expenditures, production and investment by the private sector and industrial growth in general is strong and well established. Therefore, if the wholesale price index for the 'machinery and machine tools' group rose by only 3.2 per cent in 1993-94 the reason was the slump in investment and growth. The reductions in customs and excise duties could only have been of marginal significance; in a number of other intermediate and final manufactured products where similar reduction in indirect taxes has occurred, there has been little impact on final prices The price index for manufactured products as a group registered a rise of 8 8 per cent in 1993-94 compared to 7.9 per cent in 1992-93

Inflationary pressures have raised their head since the second half of 1993-94 because, on the one hand, government policies on both demand and supply management have been inflation-inducing and, on the other, there has occurred a relative shortage of agricultural supplies. There were sizeable increases in administered prices: procurement prices of rice and wheat, issue prices of wheat, rice, levy sugar and liquefied petroleum gas (LPG), controlled prices of petrol, high speed diesel and light diesel, electricity tariffs and railway freights On the demand side, the

government's revenue expenditure continued to rise even as revenue collections fell short of targets, resulting in, particularly during the second half of the year, mounting fiscal imbalances Further, the rapid foreign exchange accruals, the equivalent of nearly Rs 24,000 crore in the second half of 1993-94, injected massive amounts of liquidity into the system. Finally, there has emerged a situation of relative shortage of foodgrains and other agricultural commodities. Though the country has experienced six continuous years of good rainfall, the actual year-to-year increases in foodgrains production after the initial jump has been meagre, just about 6 per cent over six years from 169.9 million tonnes in 1988-89 to 180.5 million tonnes in 1993-94.

Even more worrying are the severe limits on the government's ability to contain inflation in the short run. On the supply side, besides the sluggishness in output growth, there have been serious imbalances in the production pattern with the output of coarse grains and pulses fluctuating sharply but remaining stagnant over the period as a whole. Also, regional imbalances have been accentuated with some of the populous states such as Uttar Pradesh and Bihar experiencing little growth or even decline in output. Besides, as a result of the persistent erosion of real investment in agriculture by public and private sectors alike, there has been little addition to the production potential. The government's supply management has also left much to be desired. While current foodgrain production is enough to meet the prescribed nutritional norm of 500 grams per capita per day, the gross inequalities in consumption between groups and regions makes it imperative for public distribution to play an effective role. But the government has been procuring grain, essentially wheat and rice, at prices far above those recommended by the Commission on Agricultural Costs and Prices (CACP) and making open market sales at a loss. The committee of officials appointed in late January to monitor the availability and prices of essential commodities came to the conclusion that the sudden spurt in their prices had been caused mainly by large-scale hoarding by traders. The indulgent view taken by state governments, particularly those of UP, MP and Delhi, of the violations of the Essential Commodities Act led to a worsening of the situation on the supply front. The announcements of imports under open general licence (OGL) of raw cotton, oilseeds, sugar and pulses has curiously led to intensification of hoarding, speculation and market manipulation by traders

On the demand side, apart from the massive increases in the government's consumption expenditure and little hope of mobilising larger resources due to the lowering of taxes, the liquidity growth is continuing unabated due to the inflows of foreign exchange from three sources: stock market investments by foreign institutional investors (FIIs), global depository receipts and other foreign borrowings by companies and India funds floated abroad. The inflationary implications of these funds are all the greater because they are hardly used for productive purposes. We now have it on the authority of a Planning Commission official that of the funds raised by companies abroad, only 15 per cent is being spent on investment projects and the balance has gone to finance non-productive treasury management and acquisition of financial assets as well as land, besides retiring old debts.

The acute dilemmas that the government's policies have created are evident enough. First, because of the persistent recession, interest rates cannot be raised and there is limited manoeuvrability in monetary policy. Second, despite the growing foreign exchange reserves, the exchange rate cannot be allowed to rise because export profitability will suffer. However, due to a higher rate of inflation than in India's trade-partner countries, the rupee has already appreciated by about 10 per cent in real and trade-weighted terms. Finally, as inflation gets worse the government will be forced to take further measures of the structural adjustment variety to keep the FIIs and other foreign investors in good humour, but which will contribute to a deepening of the economy's structural crisis.

LEGISLATIVE PRIVILEGES

Over-Protected

THE arrest and subsequent incarceration of Nikhil Wagle, editor of the Bombay eveninger, *Mahanagar*, reopens the contentious and complex issue of legislative privileges and press freedom.

Wagle, who has been a doughty crusader against communalist journalism, was arrested for writing what has been termed a scurrilous piece casting aspersions on the character of legislators in the Maharashtra assembly and for having commented injudiciously on a condolence motion tabled in the house on the violent death of a member. Further, he refused to appear before a privileges committee constituted of legislators to decide whether his actions were in keeping with the norms laid down for reporting on the proceedings of the legislature. Late last week the Maharashtra chief minister moved the motion recommending Wagle's arrest and imprisonment for four days.

The breach of privilege motion had been moved by a Janata Dal MLA objecting to Wagle's article entitled 'Dhongebaji Kashasathi?' ('why the hypocrisy?') commenting on a condolence motion on the death of a Shiv Sena MLA who was killed in a shoot out as he was returning from a friend's funeral in 1992 and pointing to the extent of criminalisation in politics. The article had stated that several legislators had in fact taken help from criminal elements during elections and had drawn attention to the growing links between the underworld and elected representatives. Interestingly, none of the members whose names had been mentioned have taken Wagle to court on defamation charges.

Wagle's contention has been that since these links are known to exist any journalist has a right to write about them. He refused to appear before the privileges committee on the ground that it would be ridiculous to be tried by the very elements whose credentials to be people's representatives he had questioned.

The major issue however is that the concept of privilege has remained ill-defined and uncodified. The concept originally meant to ensure the British parliament freedom from interference by the Crown and blindly adopted in India has come in for critical comment from various authorities. The first and the second Press Commission as well as the Press Council of India have held that the concept of uncodified privilege is undemocratic. If rights and privileges of elected representatives are to be protected, they must first be defined. Currently, it is left to those who enjoy these rights, the legislators, to define them depending on the circumstances. Wagle's refusal to appear before the privileges committee rests on a rejection of this state of affairs.

While Wagle's writing may at the most be faulted for having been strongly worded, and his refusal to appear in person before the privileges committee (he had sent his responses in writing) an act of defiance, for the chief minister to have recommended his arrest can hardly be justified. The chief minister, or for that matter any of the legislators, could have used the occasion to further institutionalise democratic practice by seeking to define the privileges which Wagle is accused of having infringed.

The fact that none of the political parties in the assembly here or elsewhere has taken up the cause of codification of legislators' privileges indicates the enormous advantages elected representatives gain from flexible interpretation of their rights and privileges. This loosely defined concept of privilege has been repeatedly used to curb criticism or to punish those who have been critical. In other words, affording protection for the undefined rights of some encourages curtailment of the rights of the majority.

BANKS

Structural Decline

SIGNIFICANT structural changes are taking place in the banking industry, but one is not sure if these are getting reflected in policy formulation by the authorities. Broadly, the concentration of banking business in a few centres persists; the rural branch network, while it is sizeable, has mobilised

very limited rural saving and has not extended rural credit on any impressive scale. Inter-state disparities in banking development also continue; this is particularly true of the share of deposits deployed as bank credit within the respective states—the so-called credit-deposit ratios. The proportion of priority sector advances in total advances has been declining. For the various structural maladies faced by the banking industry, which has reason to be proud of its past achievements, the government and the Reserve Bank are bereft of solutions; they seem to have few ideas on how best to build on the foundation laid over a quarter of a century. The only ideas they project are those of exposing public sector banks to unbridled competition from new private banks and rolling out the red carpet for foreign banks. These can offer competition to public sector banks only in the so-called sophisticated, urban and largely wholesale market thus cornering the bulk of 'high street' banking business, leaving the more arduous tasks of retail and mass banking to the latter. The whole strategy portends yet another major upheaval in the Indian financial system with the shake-up centring on the public sector banks.

As per the RBI's *Quarterly Handout on Banking Statistics* for December 1993, rural branches of commercial banks constituted 57.3 per cent of a total of 61,740 bank branches but they mobilised only 15.1 per cent (or Rs 45,622 crore) of the aggregate deposits of Rs 3,03,087 crore; in total bank credit their proportion was 13.8 per cent. As far back as December 1985, the shares of rural branches in aggregate deposits and bank credit had already reached 13.7 per cent and 13.8 per cent, respectively, suggesting that (a) there has been hardly any increase in their share now for almost a decade, and (b) there has arisen a disparity between their share in bank deposits and that in bank credit, leading to a sharp reduction in the credit-deposit ratio of rural branches from 63.9 per cent in December 1985 to 53.3 per cent in December 1993. It is true that bank branches situated in semi-urban and urban areas lend in rural areas—a phenomenon which is captured in the concept of credit migration from the place of sanction to the place of utilisation, on which data are gathered in RBI's comprehensive *Basic Statistical Returns* (BSR). As per the BSR for March 1992, the latest available in the annual series, the credit-deposit ratio for rural areas was 77 per cent according to utilisation of credit as against 57.9 per cent as per sanction. Even in this respect, the rural areas have experienced a noticeable reduction in the credit-deposit ratio. The ratio was as high as 97.1 per cent in March 1990 as per utilisation, which is as it should be implying that rural deposits were by and large utilised in rural areas. But by March 1992 the ratio had declined to 77 per cent, which was only partly explainable by the loan waiver scheme.

A more glaring failure in banking development, particularly during the past five years, is the persistence and even deterioration of inter-state disparities. The regions which have suffered the most are the needy ones—the north-eastern, eastern and central regions. Going by the latest data for March 1992, while the southern region has enjoyed a credit-deposit ratio as per sanction of 76.5 per cent and the western and northern regions of 58.2 and 51.1 per cent, respectively, the central region had 47.6 per cent, eastern region 49.5 per cent and north-eastern region the lowest ratio of 46.7 per cent. Admittedly, the credit-deposit ratio is not a foolproof indicator of banking development. The decline in credit-deposit ratio in the recent past has been mainly attributable to the steady upward revisions in the cash reserve ratio (CRR) and the statutory liquidity ratio (SLR). Besides, as mentioned earlier, migration of bank credit tends to improve the credit-deposit ratio of some regions. Bankers also claim that absence of infrastructural development in the underdeveloped states and regions has been preventing them from expanding their credit base there.

Even so, all things considered, there is little justification for the banking industry to persistently lend less than the amount of deposits mobilised in a state or region. This is particularly so with regard to the poorer states and regions. Even after taking into account migration of credit, the credit-deposit ratio for the central region as per utilisation was just 50.2 per cent (as against 47.6 per cent as per sanction) at the end of March 1992. Within the region, Uttar Pradesh had a credit (utilisation) to deposit ratio of 45.3 per cent and Madhya Pradesh 63.2 per cent. For the eastern region as a whole, the corresponding ratio was 49.1 per cent and within the region Bihar had only 38.5 per cent and West Bengal 51 per cent. These compare with the southern region's credit to deposit ratio (utilisation) of 77.7 per cent or those of 81.1 per cent for Andhra Pradesh, 80.5 per cent for Karnataka and 89.1 per cent for Tamil Nadu. It is significant that for Kerala the ratio is as low as 52.2 per cent (51.7 per cent as per sanctions).

It is not only that these ratios are low but what is disquieting is that some of them have declined over the recent years. In the case of the north-eastern region, the credit (utilisation) to deposit ratio was 70 per cent in March 1990 which came down to 66.3 per cent in March 1992. The corresponding ratios for the eastern regions were 52.6 per cent and 49.1 per cent. For every major state in the eastern region, namely, Bihar (39 per cent to 38.5 per cent), Orissa (92.5 per cent to 71.1 per cent) and West Bengal (53.9 per cent to 51 per cent) the ratio has registered a fall. In the central region, while MP has shown a decline in the ratio from 68.1 per cent to 63.2 per cent, UP has experienced an increase from 32.8 per cent to 45.3 per cent, though the latter ratio is still low. In the case of Kerala again there is a sharp decline in the credit-deposit ratio from 95.4 per cent in March 1990 to 52.2 per cent in March 1992.

A similar structural deterioration is occurring in regard to the share of priority sector advances in total bank credit. There was a steady decline in this ratio from 43.8 per cent in June 1988 to 37.1 per cent in March 1992. In fact the ratio dipped below the norm of 40 per cent after the structural adjustment programme and the acceptance by the government of the Narasimham Committee recommendations. The banks' consolidated balance sheets for 1992-93 show an even sharper decline in this respect. In respect of the public sector banks, the priority sector ratio has fallen from 37.6 per cent in March 1992 to 34.1 per cent in March 1993. In respect of private sector banks the ratio has remained low at about 29-30 per cent and foreign banks around 9 per cent (against the target of 15 per cent for the latter). What is disquieting is that even some of the well known southern banks, which have enjoyed a tradition of relatively large, even above 50 per cent, priority sector advances, have begun to move away from such lending. Syndicate Bank, which had once nearly 55 per cent priority sector advances, had brought down the ratio to 36.3 per cent in March 1992 and to as low as 30.3 per cent in March 1993. The same is true of Canara Bank, Karnataka Bank, Vijaya Bank, Indian Bank and Indian Overseas Bank. Significantly, this has been occurring at a time when the unorganised sectors of the economy have been showing signs of dynamism and expanding their shares in output, exports and employment.

MEDICAL EDUCATION

Vice of Tradition

THE arrest of a professor of surgery in state government-run GT Hospital in Bombay on charges of corruption in the course of evaluating students in the graduate and post-graduate examinations is a shocking revelation not only of 'moral turpitude' in the corridors of education, but a reminder of the prevalence of an outmoded, archaic and stultifying system which ensures the silence of juniors and students. In no other course of professional training perhaps have the hierarchies been so rigidly enforced and so strictly adhered to as in medicine.

The GT Hospital professor B M Sabnis was examiner for the Bombay University and an internal examiner for the hospital. In what appears to have been an efficiently-run racket, Sabnis not only ensured required grades to those who would not otherwise have made the grade, but also collected from competent students, and punished those who did not pay by ensuring that they failed the examination. In the one-and-a-half years

that he has been examiner for the MBBS and MS examinations, Sabnis is alleged to have collected these 'fees' from at least 50 students and to have failed at least an equal number. His rates were: Rs 20,000 for theory examinations and Rs 40,000 or thereabouts for practical and theory combined at the undergraduate level. If the student wished to secure a first class, he charged Rs 10,000 extra. For the postgraduate exam he charged around Rs 1 lakh. The professor also charged undertrials for delivering 'special treatment' and for prolonging their stay in hospital. It is hardly surprising that students in the government medical college hostels distributed sweets when he was arrested.

The more important issue here is not the money Sabnis was charging but the fact that the extortion, for that was what it was, went on for so long. Students in Bombay's medical colleges are, it may be pointed out, in a sense the *creme de la creme* of the vast numbers who struggle through the plus-two, given that the cut off point for entry into medical colleges stops at some unbelievably high percentages of marks—clearly a group which is highly motivated to strive for success at any cost. Confronted with a Sabnis (who is alleged to have collected money from good students, too) one would ordinarily have expected this lot to protest. The fact however is that located as they are at the bottom rung of the rigidly hierarchical system which incorporates the worst aspects of the teacher-student relationship, they are rendered too vulnerable.

A system of education in which precept and practice are equally important is necessary for the imparting of medical education because the practice of medicine is more than the application of science and scientific methods. Over the years, it has incorporated and codified a set of rules of interpersonal behaviour, the most important of which is between patient and doctor which is an essential aspect of the practice of medicine. But inevitably, it also codifies behaviour between teachers and students, seniors and juniors, nurses and doctors, and so on, which especially in third world countries, has remained unchanged for generations. While this may make for a smooth transfer of good practice, it also ensures that bad practice is not questioned and is even condoned and continued. These are the factors which perhaps have kept the medical community, especially those in public hospitals, from vocally and collectively condemning corrupt practices.

The fact that there have not been more Sabnises is in this sense a great cause for celebration. But given the increasing commercialisation of medicine and commodification of medicare, there is a serious need to put into place review and monitoring systems which do not depend on the whims and fancies of a single individual. It also means that bodies which have to do with medical practice and education, especially the Indian Medical Council, need to give serious thought to reviewing not just the standards of practice but the culture, the tradition and the socio-economic milieu in which these operate. More immediately, one must ask why the Maharashtra Medical Council has made no statement about the issue, even though the investigating authority has said that it would recommend the professor's dismissal as well as his name being struck off the medical register.

BOSNIA

Prolonging the Conflict

AFTER Gorazde, Bosnia is no nearer to a solution. The reason is the US, NATO, UN and Russia, the parties that can enforce a decision in Bosnia, have not yet agreed upon a solution. In fact, they do not even seem to be fully convinced whether a short-term solution is imperative. Meanwhile, Bosnian Serbs, the aggressor party in the conflict, continue to take full advantage of the situation.

The raid on Gorazde was, in a way, a direct outcome of this situation. It is obvious now that after having ensured a vacation of Bosnian Serb forces from Sarajevo through a threat of punitive air strikes in February, the US, NATO and the UN, particularly the former two, had lapsed into a false sense of security. Though it was clear even then that the Bosnian Serbs were using the negotiations to prolong the war in order to register territorial gains, the US, NATO and the UN made no special effort subsequently to cut short the process and enforce a decision on the warring parties. Admittedly, such an enforcement had become difficult after the Russian government, under pressure from Zhirinovsky and certain sections of the Russian population sympathetic to the Serb cause, started taking interest in the conflict in a manner that discouraged joint military action against the Bosnian Serbs—a factor that continues to be operative even now. However, the Russian pressure is not the only reason why decisive UN-NATO action has not been taken so far in Bosnia.

Apart from the fact that the US is no longer strategically as interested in the European sector as it used to be in the cold war days (a situation that may now change after Russia has strategically bestirred itself once again), NATO itself has been, and remains to this day, deeply divided over the question of military solution in Bosnia. As of now, only the US seems to be fully convinced of the necessity and wisdom of such a solution, although even the US has only lately come round to this position after the Clinton administration found itself losing popularity over its policy in Bosnia. The other NATO members, mainly England, Germany, Canada and Greece, seem unwilling to commit their forces to an action that promises no visible economic, political or even strategic dividends and in which they may become party to a conflict that has roots going back into history. This unwillingness stems from another, more immediate factor, too. Despite its current eagerness to take action in Bosnia, the US is refusing to use its ground forces; it wants to leave that part of the commitment to its European partners, who see this as leading to an eventuality in which they would be left with the main responsibility of enforcing a solution through military means. Hence their insistence on still trying to find a negotiated settlement to the problem.

In this connection, even the UN cannot totally escape criticism. While in the case of Sarajevo the UN showed greater eagerness for NATO to take military action, in the Gorazde incident it dragged its feet. At a time when the NATO troops were waiting for clearance from the UN to put punitive air strikes into effect, the UN special representative for former Yugoslavia, Yasushi Akashi, refused to grant permission. Part of the reason for this procrastination must be the differences between the top UN officials. True to his activist image, the general-secretary Boutros Ghali has always shown willingness to adopt a tougher approach to finding a solution to the Bosnian imbroglio. In the case of Gorazde, however, the immediate decision was taken by his representative who forbade the NATO troops to make air strikes as the Bosnian Serbs, he said, had already started withdrawing from the area. Since the withdrawal had actually begun, the decision appears to be partly justified. It is not certain, nevertheless, whether Ghali was at all consulted.

Not that Russia has demonstrated a more cohesive policy on the matter. Indeed, the Russian government is as riven by differences as the UN or the governments of the NATO countries. While Yeltsin and the foreign ministry are in favour of a softer approach, the defence ministry and the generals want to use the conflict as a cover to assert traditional Russian claims in the region. The Bosnian Serbs are aware of this ambivalence, pulling Russian policy in contrary directions. This division within the Russian government has certainly reduced the credibility of Russia as a military power on the European terrain in the eyes of NATO. No wonder, the latter has of late been showing a tendency to ignore Russian opinion in Bosnia. Nevertheless, the very presence of Russia in the diplomatic discourse around Bosnia—a presence that Russia has made felt in no uncertain terms—is sufficient to deter NATO from taking any 'rash' action. Since given the current balance of power within the Russian government, this presence tends to favour the Bosnian Serbs, it is likely to have the effect of prolonging the Bosnian conflict.

Tri-Star Soya

TRI-STAR SOYA PRODUCTS, one of the largest soyabean processors in the country and a recognised export house, is implementing a forward integration programme as also an expansion-cum-modernisation scheme for its existing facilities at an estimated cost of Rs 12.8 crore. The company will be manufacturing 5,760 tpa of texturised vegetable protein and 7,500 tpa of vanaspati. These are being part-financed by a rights issue of 13,87,400 equity shares of Rs 10 each at a premium of Rs 40 per share to its shareholders in the ratio of one equity share for every three shares held. The issue opened on April 18 and is lead managed by 20th Century Finance Corporation. While the expansion of the soyabean processing capacity from 1,50,000 tpa to 2,25,000 tpa was completed in November 1993, trial runs of the texturised vegetable protein plant and vanaspati plant are expected to be completed by the end of April and September this year, respectively. The company is now expanding the soyabean processing capacity to 3,00,000 tpa which is expected to be commissioned by this November. With the completion of these projects, it is expected that the company will post a turnover of Rs 150.5 crore in 1994-95. Profit after tax has been estimated at Rs 5.8 crore and EPS at Rs 11.2.

Arora Fibres

Arora Fibres is setting up a project to manufacture polyester staple fibre (PSF), polyester and nylon chips through recycling/regeneration of polyester and nylon waste at an estimated cost of Rs 22 crore. The plant will be situated at Silvassa in the Union Territory of Dadra and Nagar Haveli and the company has entered into a tie-up with Mijung Ind Company of Korea for the manufacturing process, supply of machinery for PSF making line and 50 per cent buy-back of the products. The polyester/nylon chips reclaiming line is being supplied by Sikoplast Mashinenbau Koch GmbH of Germany. Commercial production is expected to commence in October this year. To partly meet the cost of the project, the company will be entering the capital market shortly with a public issue of 96,00,000 equity shares of Rs 10 each at par aggregating Rs 9.6 crore. Apart from the public issue, the project will be financed by rupee term loans from IDBI, suppliers' credit and unsecured loan from promoters. The shares of the company are proposed to be listed on the Bombay, New Delhi, Ahmedabad, Calcutta and Madras stock exchanges.

L S Synthetics

L S Synthetics, a manufacturer of polyester blended shirting and suiting under the established brand name 'Oxford' and belonging to the Kachins group, will be shortly entering the capital market with a public issue of 13,00,000 equity shares of Rs 10 each at a premium of Rs 25 per share aggregating Rs 4,55,00,000. The issue is being made to part finance the cost of expansion of its existing shirting/suiting, weaving unit and forward integration plan of establishing a process house. The company is a supplier of fabrics to leading fashion houses manufacturing brands like Louis Philippe, Van Heusen, Park Avenue, Charagh Din, Double Bull, Cliff and Zodiac. The company's weaving unit is situated at Ankleshwar and the process house would be situated close to the existing unit. The promoters will have a stake of 72 per cent in the post-issue equity capital of the company. The projected EPS, after implementation of the project, is Rs 8.4, Rs 9.20 and Rs 9.2 for 1995-96, 1996-97 and 1997-98, respectively. The shares are proposed to be listed on the Bombay, Ahmedabad and Madras stock exchanges.

Stone India

Stone India (SIL), jointly promoted by G P Goenka and Stone Overseas Holdings of the UK in 1991, is engaged in the manufacture of electrical and mechanical engineering equipment for the railways and defence sectors. The company has now drawn up an expansion cum diversification programme involving an investment of Rs 30 crore. Firstly, the company is setting up an export-oriented venture for 14" VGA computer colour monitors with an installed capacity of 1.20 lakh monitors per annum at an estimated cost of Rs 6.4 crore in collaboration with Winny Electron Enterprises of Taiwan. Expected to go on stream by this July, the latter has agreed to buy-back 75 per cent of the company's production. Secondly, Stone India is setting up a brake block unit with a capacity of 2.5 lakh units per annum in technical collaboration with Futuris Industrial Products of Australia. The project cost has been estimated at Rs 15 crore and is expected to commence production from June 1995. Thirdly, the company has embarked on a rubber project at an estimated cost of Rs 1 crore to manufacture moulded rubber components. This unit will commence production by May this year. Last but not the least, the company is modernising its existing factory situated at Taratalla in Calcutta in phases and is expected to go on stream by early 1995-96. To part finance these projects, Stone India is offering a rights issue of 4.34 lakh 16 per cent FCDs of Rs 140 each at par with detachable and separately tradable warrants in the ratio of 1:8 and 24.4 lakh 16 per cent secured redeemable PCDs of Rs 50 each with separate tradable warrants. Part A of Rs 35 each will be converted into one equity share of Rs 10 each at a premium of Rs 25 per share and the non-convertible Part B of Rs 15 will be redeemed at the end of the sixth, seventh and eighth years. The rest of the amount will be raised through rupee term loans of Rs 4.1 crore, lease finance of Rs 2 crore and internal accruals of Rs 1.9 crore. The issue is opening on May 3 and is lead managed by SBI Caps and ANZ Grindlays.

TCI

Transport Corporation of India (TCI), which has an extensive transport network throughout the country, is expanding its activities. The company, whose activities are divided into five divisions—transport, TCI-shipping, Wheels rent-a-car division, Gati desk-to-desk cargo division and Transport International Bureau exchange division—is adding 100 trucks, 221 cars, 50 LCVs and one ship to its existing fleet. It is also computerising its entire operations. The expansion programme is being part-financed by a rights issue of PCDs and FCDs. TCI is offering 6.35 lakh 15 per cent FCDs of Rs 120 each in the ratio of 4:50 and 10.60 lakh 15 per cent redeemable PCDs of Rs 120 each out of which 7.95 lakh PCDs are being offered to the investing public, 1 lakh 15 per cent PCDs to UTI and 53,000 15 per cent PCDs to SCICI. While part A of Rs 40 will be converted into one equity share of Rs 10 at a premium of Rs 30 each on allotment, part B of Rs 80 will remain as the non convertible portion and will be redeemed in the sixth, seventh, eighth and ninth years in four equal instalments of Rs 20 each. The issue opens on May 2, 1994 and is being lead managed by SCICI and SBI Caps. The company's equity, which stands at Rs 7.63 crore at present, will go up to Rs 10.6 crore after the conversion of debentures. TCI has been promoted by S N Agarwala and family which have interests in 16 other companies. The company has also taken on lease the operations of Bhoruka Aluminium, a sick unit, for a period of three years. SBI has projected net profit of Rs 6 crore on sales of Rs 267.5 crore for 1994-95. EPS has been projected at Rs 7.9.

CURRENT STATISTICS

***EPW* Research Foundation**

The seasonal trends in money and banking suggest that the entire part of the increase in non food credit of scheduled commercial banks during 1993 94 took place during the second half of the year Even so the incremental credit deposit ratio during the half year period was only 42 1 pe cent that is one half of that in the corresponding period of 1992 93 despite substantial release of funds due to reductions in CRR and SLR On the other hand commercial banks investment portfolio was on the rise with the incremental investment deposit ratio soaring to 51 4 per cent as against 37 6 per cent in the previous year Fiscal year 1994 95 has also begun with a further liquidity build up Despite encouraging corporate results and excise duty reliefs the share prices are sliding as the FIIs are withholding their commitments

CESC

Record Power Generation

AN R P Goenka group company, Calcutta Electric Supply Corporation (CESC) has been growing from strength to strength With the company's old as well as new generating stations operating efficiently and achieving peak generations, the company could provide Calcutta a load-shedding free summer in 1992-93. The company achieved a 10.8 per cent increase in power generation during the year from 3,104 mu to 3,437 mu without any addition to plant capacity. While the Titagarh generating station generated 1,585 mu of power, the highest in a year so far with a plant load factor of 75 per cent and an average peak generation of 92 per cent, the southern generating station produced 833 mu of energy and achieved a plant load factor of 70 per cent. The company sold 4,035 mu of energy as against 3,902 mu in 1991-92.

Thus, the company reported higher sales and a much improved profitability during the year. Net sales went up by 14 per cent and profit after tax by a whopping 65.5 per cent. Operating profit went up by 36.3 per cent.

To further enhance its power generating capacity, CESC is setting up two power generating stations. One at Budge Budge, South Parganas district in south Bengal, and the other at Balagarh, 60 km north of Calcutta. The 500 MW thermal power generating station at Budge Budge is expected to cost Rs 2,000 crore and will be the first ever private sector investment in West Bengal, for which the company has tapped various sources of finance. Apart from the Rs 21 crore non-convertible issue that it came out with in November 1993 and loans from Indian financial institutions, the company has arranged for $ 32 million loan from the Asian Development Bank, Manila; export credit loan of pound sterling 64.5 million from Kleinwort Benson backed by the Export Credit Guarantee Department of the British government for importing two 250 MW turbine generator sets from Parsons Turbine Generators of the British Rolls Royce group; and finally, $ 60 million loan from International Finance Corporation, Washington. The first phase of the project, involving installation of one unit of 250 MW, would be completed by March 1996 and the second by March 1997. The 1,500 MW coal fired thermal power station at Balagarh will be completed in three phases, each being of 500 MW.

CESC has also diversified into the manufacture of cotton yarn through its wholly-owned subsidiary, CESCON. The company is making an equity investment of Rs 9 crore in the new venture named Spentex Industries. Entailing an expenditure of Rs 54.8 crore, the project is a 100 per cent export-oriented unit at Baramati near Pune in Maharashtra.

During the first half of 1993-94, CESC's performance was particularly noteworthy with the company reporting sales of Rs 416.6 crore and a net profit of Rs 12.5 crore.

HERO HONDA MOTORS

Higher Market Share

Established in 1984 as a joint venture between Honda Motor Company of Japan and India's Hero group with each having a 26 per cent share, Hero Honda Motors (HMML) has made a remarkable turnaround from a sick company that was referred to the BIFR a couple of years ago. So much so that despite a 12 per cent fall in the overall motorcycle market, the company increased its market share from 48 per cent in 1991-92 to 54 per cent in 1992-93 among the 100 cc motorcycles. As such, net sales increased by 11 per cent but the 92 per cent rise in other income failed to prop up its total income which rose by only 12.7 per cent. While operating profit increased by 10 per cent, net profit failed to increase proportionately. Exports, however, jumped from 555 motorcycles valued at Rs 1.2 crore to 4,512 motorcycles worth Rs 11.2 crore during the year. The company proposes to explore new markets like Latin America, China and Iran and has targeted export of 8,000 motorcycles in 1993-94.

With the 1993-94 sales target pegged at 1,50,000 motorcycles, the company has initiated several measures which, besides the introduction of new models, include the expansion of activities of Hero Honda Finlease, to provide easy and cheaper consumer finance. The company recently launched its new 100 cc bike with a fuel economy of 85 km per litre.

With a view to achieving a production capacity of 3,00,000 motorcycles in the next five years, the company has taken the first step of setting up a new motorcycle manufacturing unit at Gurgaon at a cost of Rs 160 crore. The plant will have the capacity to produce 1,50,000 motorcycles per annum and commercial production is expected to start by end-1995. While 50 per cent of the project cost will be financed through internal accruals, the remaining will be raised through a public issue towards the end of 1994. Even the capacity of its existing plant at Bhiwadi in Rajasthan is to be increased to 1,80,000 from 1,50,000 by the end of the current calendar year.

Further, the company is setting up a joint venture in China for 65 cc step-through motorcycles. Reportedly, a memorandum of understanding has already been signed with the Chinese state enterprise to produce 1,00,000 motorcycles a year at Chengdu. Three more assembly operations in Vietnam, Colombia and East Africa are being planned. The existing ones are in Iran, Egypt, Brazil, Bangladesh and Mauritius which are fed with completely knocked down (CKD) kits from India and have a capacity of assembling 1,000 motorcycles monthly.

During the first six months of 1993-94, Hero Honda has reported a substantially higher turnover of Rs 161.7 crore and net profit of Rs 6.5 crore.

TAMIL NADU PETRO

Diversification Project

A joint sector company of Southern Petrochemical Industries Corporation (SPIC) of the Muthiah group and Tamil Nadu Industries Development Corporation, Tamil Nadu Petro has been doing well ever since its inception in 1988. The company is a leading manufacturer of linear alkyl benzene (LAB). And, in spite of a glut in the domestic market, communal disturbances and increase in cost of inputs like kerosene and benzene, sales increased by 21.7 per cent with production going up from 69,321 MT to 83,640 MT at a capacity utilisation of 110 per cent. Profits after tax also went up, though by just 5 per cent even as operating and gross profit went up by 16 per cent and 17 per cent, respectively. The company also made a one-time gain of Rs 10.1 crore on cancellation of forward cover contracts with banks in respect of foreign currency loans availed for the LAB project. Exports were good with the company exporting 17,462 MT of LAB as against 4,990 MT in 1991-92. Valued at Rs 33.1 crore, the company exported its products to Unilever, Henkel, Procter and Gamble, Helm, Mitsui, Petropharma and Petresa and 1,115 tonnes were supplied on deemed export basis. It is also taking steps towards achieving the ISO 9002 accreditation.

Tamil Nadu Petro is now diversifying into epichlorohydrin (ECH), an organic compound, in collaboration with Consur of Italy, a world-renowned process engineering company. Estimated to cost Rs 103.5 crore, the 10,000 tpa ECH plant is being set up at Manali, opposite the existing plant and is expected to go on stream by April 1995. ECH, which will be manufactured for the first time in India, is mainly used in the manufacture of epoxy resins and plant pesticides (endosulphan and quinalphos) besides being used in tooling and moulding products, adhesives, flooring and paving, construction and civil engineering applications. The company plans to sell 50 per cent of its production to Europe.

The company is also making rapid strides in research and development activities. While new analytical methods to find out the minor elements in LAB have been identified, the company has developed a textile wetting agent and transformer oil. A memorandum of understanding has been signed with Total Lubricants International, France, in October 1992 to explore the possibility of establishing a joint venture for the manufacture of lubricants used in the automotive industry.

Meanwhile, for the first six months of 1993-94, TN Petro has posted a net profit of Rs 7 crore on sales of Rs 122.6 crore.

STRAW PRODUCTS

Capacity Expansion

Belonging to the JK group with Hari Shankar Singhania at the helm, Straw Products has interests primarily in paper and cement. The company was recently in the news when it took over Udaipur Cement Works from R K Bajaj-controlled Bajaj Hindustan. Udaipur Cement has since been named J K Udaipur.

With both the paper and cement industries slumping under the recessionary onslaught in 1992-93, Straw Products' performance suffered a setback with both turnover and profitability declining. Production of both paper and cement declined by 1.4 per cent and 9 per cent, respectively and poor offtake from the government sector as also tight liquidity conditions affected margins. Exports of paper, however, increased with the products finding acceptance in the Malaysian, Sri Lankan, Singapore and west Asian markets. To offset the recessionary pressures and meet changing customer preferences, J K Paper Mills is realigning its entire production range The company is expanding the capacity of its paper mill from 60,000 tpa to 80,000 tpa. A new paper machine is being introduced for the purpose along with other balancing and modernisation items that will result in cost reduction, energy saving and quality upgradation. This is expected to entail an investment of Rs 160 crore. The company has also taken up conversion of existing coal-fired boilers into fluidised bed conversion (FBC) system which will improve steam generation despite the poor quality of coal now available.

Cement production during the year suffered from paucity of clinker due to erratic production from the kiln. It is with a view to consolidating its presence in the cement market that the company has taken over Udaipur Cement Works. With this, the total cement production of the J K group will go up from the existing 5.8 lakh tonnes per annum to about 24 lakh tonnes per annum by the latter half of this year, assuming that the new one million tonne per annum plant of the company also goes on stream by then. Besides, the company is expanding the installed capacity of its Lakshmi Cement plant from 5.8 lakh tonnes to 14.6 lakh tonnes per annum. The project is expected to go on stream by the last quarter of this year. A lignite feeding system has also been provided to achieve increased usage of lignite in place of coal for substantial cost advantage.

J K Magnetics, another division of Straw Products, achieved a record production of 1998 MRM during the year, achieving a capacity utilisation of 106 per cent against only 50 per cent in 1991-92.

Research and development efforts have enabled the company to introduce different varieties of paper like bond, copier, maplitho and coated papers which enjoy market leadership. R and D activities at J K Magnetics have resulted in 100 per cent indigenisation of major raw materials and increase in the speed of various machines. New formulations have also been developed which have resulted in improvement of quality.

The half-yearly results for 1993-94 reveal that the company has posted a net profit of Rs 5.3 crore on a turnover of Rs 126.7 crore.

PARASRAMPURIA SYNTHETICS

Rise in Sales

Parasrampuria Synthetics, the flagship company of the Parasrampuria group, is a leading manufacturer of polyester filament yarn and polyester grade chips. During 1992-93, while production of polyester yarn increased from 922 million tonnes to 2,164 million tonnes, that of polyester chips went up to 422 million tonnes from 24 million tonnes. As a result, despite recession in the PFY industry, net sales went up by 20 per cent. Operating profit too increased by 34 per cent and a considerable hike in the interest burden notwithstanding, gross profit showed a rise of 10 per cent. However, profit after tax declined by 25.4 per cent which the company has attributed to the high depreciation cost on account of its expansion programme as also the transporters' strike and civil disturbances. The company exported over Rs 6 crore worth of synthetic yarn. Interestingly, while total remuneration to employees increased by 37 per cent, as a percentage of gross value added and value of production, it has more or less remained the same as in the previous year.

Following the commissioning of the first line of its 7,500 tpa polycondensation plant in March 1992, the company commissioned the second line with a capacity of 7,500 tpa in January 1993. It has also installed one more spinning unit with a capacity of 1,300 tpa which went on stream in September 1992. Meanwhile, the location for the company's proposed terry towel project has been changed from Pithampur near Indore to Delhi. This project is expected to commence commercial production by the middle of this year along with the export-oriented synthetic blended yarn project coming up at Pithampur. To partly meet the cost of these projects, Parasrampuria had come out with a rights issue of fully convertible debentures in January 1993. Now the company is planning to expand its POY capacity at Bhiwadi from 16,000 to 20,000 tpa and that of polyester chips from 15,000 to 18,000 tpa.

Research and development efforts have enabled the company to develop new varieties of yarns to substitute yarn imported by textile producers such as non-sized, roto and bright yarn; development of new varieties of yarn for export of high count yarn, dope-dyed black yarn, optically bright polyester yarn, development of import substitutes of various master batches used in the manufacture of polyester and polypropylene, development of an import substitute for continuous polymer filter, development of spin finish for POY up to 1,000 mt/min.

With the polyester filament yarn (PFY) industry having been accorded sops in the budget for 1994-95, the industry is expected to perform much better in the forthcoming years. Also, with polyester yarn becoming cheaper than cotton yarn, there is expected to be a marked shift in consumer preferences.

The company has reported improved sales of Rs 119 crore for the first half of 1993-94 as against Rs 103.6 crore in the corresponding period of the previous year. Cash and net profits have also shot up from Rs 6.1 crore to Rs 14.4 crore and to Rs 11.4 crore from Rs 4.8 crore, respectively.

What Has Gone Wrong with the Economic Reforms?

***EPW* Research Foundation**

The manifest failure of the economic reforms is not surprising at all considering the serious flaws in their conception, strategy and implementation

THERE is now enough evidence to the effect that the avowed objectives of the stabilisation and structural adjustment programmes under implementation in India since July 1991 have not been achieved nor is there hope of their being achieved in the medium term In the first place, the failure to attain the most immediate stabilisation goals—goals of monetary and price stability as also those of correcting the central government's fiscal imbalances—stares one in the face The relative stagnation in industrial output for the third year in succession, the structural deterioration in the composition of output and also that of exports, the general absence of growth momentum including declines in the domestic saving and investment rates, distinct signs of deterioration in the already serious unemployment and under-employment situation in the country, the erosion of real incomes, the reduced governmental support for the already fragile health and educational standards of the vast vulnerable sections of society, are all by now known to be a direct outcome of the new economic policy The only apparent sign of success is to be seen in the external sector where the stock of foreign exchange reserves (other than gold) had touched $ 15 3 billion by the first week of April, but the increase to a sizeable extent is based on the further accumulation of external liabilities (other than foreign direct investment) that are more expensive than commercial borrowings and also based on underlying external-sector-driven growth with policy prescriptions of aggressive import liberalisation, export orientation and globalisation, which are unlikely to contribute to a strengthening of the country's domestic economic structure [1]

Background of 1980s

It cannot be denied that the Indian economy had plunged into a serious economic crisis towards the end of the 1980s due to what may be termed as 'borrowed growth' and that it required drastic measures to correct the series of structural imbalances accumulated over that decade However, the new economic policy has been based in the first place, on an incorrect assessment of the maladies afflicting the Indian economy during that period The macro-economic imbalances in the form of large fiscal deficits and growing public debt, sizeable current account deficits and unsustainable levels of external debt and their expansionary influences on money supply and high rates of inflation, which the present government has identified as the root causes of the economic crises, were really symptoms of a deeper structural crisis faced by the domestic economy [Planning Commission 1990(a) Vaidyanathan 1988]

It was not essentially the size of borrowing but the purpose for which the resources were spent that mattered There was a sharp growth of non development expenditure in the total expenditures of both the central and state governments The public sector funds earmarked for rural sector in general and agriculture in particular had dwindled in real terms thus diluting the impetus for private investment in these sectors The domestic savings and investment rates had virtually stagnated for over a decade Despite a noticeable improvement in the economy's overall growth rate and that in industrial production specifically the rate of increase in employment had decelerated significantly in almost every sector of the economy [Planning Commission 1990(b)] The only segment that had shown some dynamism in employment absorption during the 1980s was rural manufacturing in non-household, non-factory establishments [Vaidyanathan 1990 Visaria and Minhas 1991 and Papola 1991] Associated with the trickle-down theory the new economic policy has sought to correct the symptoms leaving these basic and fundamental issues to be resolved as a by product

Major Flaws

Thus, the new economic policy is seriously flawed in conception, and it is also flawed in our view in its contents strategy and approach and in many other respects We could broadly classify these shortcomings under five major categories

(i) the new economic policy lacks a broader vision and development strategy
(ii) the sequencing of reforms has been seriously flawed
(iii) the pace of reforms has been rather too rash and cavalier in character,
(iv) the reforms have been initiated without taking cognisance of the absence of the required pre conditions in the Indian society and
(v) appropriate and broad based safety nets have not been put in place

By their very nature some of these factors are interrelated such as the sequencing of reforms and pace of reforms or the presence of pre conditions and provision for safety nets But all of these factors put together add up to a powerful commentary on the inappropriateness of the reform measures undertaken so far

(i) *Absence of a Broader Developmental Vision*

The focus of practically every aspect of the new economic policy is to create a competitive environment in industry and service sectors in which entrepreneurial decision making would be conditioned only by the market forces With the abolition of industrial licensing and with the free access to foreign technology entrepreneurs are said to be free to invest, expand and modernise in response to market conditions But the industrialisation experience of many countries in south east Asia suggests that individual decisions of entrepreneurs based on market considerations generally do not add up to a strategy of industrial development and industrial restructuring unless governments intervene actively to direct markets to achieve a transformation of their comparative advantages into a dynamic form, that is by refusing to accept the static models which suggest that LDCs should respond to world prices and produce and sell those commodities which generate immediate incomes Viewed in this light the government s new industrial policy lacks a well-articulated strategy

In contrast the south east Asian countries which embarked on the process of industrialisation during the 1960s 1970s and 1980s did so on the basis of some structured blue prints and by a process of significant market intervention directly or through systems of incentives and disincentives Secondly and more importantly, all of them resorted to domestic liberalisation far ahead of external liberalisation A dynamic role for the state supported by a system of dynamic import substitution was an integral part of that strategy For exam-

ple, South Korea's industrial development strategy was by no means a socialist strategy guided as it was by a totalitarian regime. A report on 'Korea's Transition to Maturity' argues that the quality of economic management had been one of Korea's major achievements and that in this respect the co-ordination of economic policies through the instrumentality of the Economic Planning Board headed by "successively effective deputy prime ministers" should be largely credited [Leipziger 1988(a)]. The report further argues that even when South Korea embarked on a liberalisation programme in 1979-80, after passing through two phases of industrialisation—first, between 1961 and 1973 when there was a modest pro-export bias accompanied by a high degree of protection to domestic industries and second, during 1973-79 which saw an intensified heavy and chemical industry drive (including ship-building) again based on heightened and broadened protection for domestic industries and which brought government directly into industrial decision-making—the reforms included "a basic shift towards industrial intervention policies predicated on the presence of market distortions or market failure" [Leipziger 1988(b); see also Esho 1992]. Incidentally, it was revealing how the South Korean government steadfastly pursued the strategy of 'heavy and chemical' industrialisation targeting six industries (steel, metal, machine-building, ship-building and electronics and chemicals) for intense government support and development, despite the stiff opposition from the IMF and the World Bank. Apparently, the IBRD country report on South Korea expressed, in early 1974, grave reservations on the development strategy and exports set for heavy industries [Woo 1991; Kawakami 1992]; instead the World Bank had urged the Koreans to focus on light manufacturing industries and textiles on the ground of comparative advantage. That the World Bank was proved wrong in South Korea in this respect should be an interesting lesson for India. Judged against this and the experiences of the east Asian countries, it was not the interventionist strategy that was at fault in India; it was rather the absence of flexibility with the bureaucracy in administering the system that ruined the growth process. Comparing the Indian experience with that of Korea, a Japanese scholar makes a perceptive observation thus: "So came into full bloom in the 1970s the Korean type of development planning and economic management with its heavy state intervention. It might be recognised that its tendency towards heavy government control matched if not exceeded that of Indian 'socialist' economy which is ideologically influenced by the Soviet Union. However, it is worth to note also that economic management by the Korean government maintained a remarkable flexibility in comparison with the situation in India, and displayed quick and entrepreneurial responses to the constant changes of an increasingly uncertain world market" [Kawakami 1992].

A more telling example is that of Japan in respect of the strategy of industrialisation. Consistently since the early 1950s the Japanese economic development has been guided by what has come to be known as a 'long-range economic plan' which serves as "guideposts for economic operation within the basic institutional framework of free enterprise and a free market" [Tsuru 1993:95]. As has been sufficiently documented in literature, particularly in the context of the direct administrative guidance by the ministry of international trade (MITI), the most important of the areas in which administrative guidance has been effective in post-war Japan is its co-ordinating role in investment programmes of major industries. Again, as Tsuru has argued, these paternalistic arrangements helped to encourage a high rate of investment across the board in the manufacturing sector as a whole. Apart from a comprehensive blueprint on the strategy of industrial development, this policy of intervention involved many forms of incentives and disincentives. Above all, it involved an extremely careful approach to transfer of technology from advanced countries through direct imports of equipment, their unbundling and a process of assimilation and diffusion [Yanagihara 1994].[2]

The above and many other experiences suggest that market forces do tend to reinforce only short-term gains and hence they cannot produce a long-term strategy. Also, the national economy's long-term interest is better served if local entrepreneurship is given greater impetus and preferential treatment as against the multinational companies. The evolution of commercial policies requires a significant promotional input with a commercial vision. The present situation calls for, if one may put it that way, the services of a T T Krishnamachari! Among other things, it was he who conceived of a strong promotional policy for industrialisation through the setting up of a series of development finance institutions to supply long-term loan capital for industry.

The Indian experience during the past three-and-a-half years suggests that economic reforms have essentially been bureaucracy-led and essentially inspired by a narrow perspective of the IMF/World Bank stabilisation and structural adjustment programmes, with market-orientation and globalisation as the be-all and end-all goals. There is no other blueprint for any long-term industrialisation strategy or strategy of economic and social development. A clear evidence of this is to be seen in the absence of any role for India's Planning Commission in the metamorphic changes that are being inflicted on the economic system through the new economic policy. Though the current Eighth Five-Year Plan (1992-93 to 1996-97) under implementation has been prepared much after the current reform measures began in July 1991, almost not a single aspect of the goals set out in the Plan document is sought to be implemented through the new economic programmes. Apart from the total neglect of the macro-economic goals, the programmes under the new economic policies go to contradict the Plan goals set, say, for resource mobilisation through direct and indirect taxes or those set for employment generation as the Eighth Plan had begun with a situation of considerably reduced rate of employment growth and large backlog of unemployment. Significantly, even the pattern of Plan outlays proposed in the Plan document are not being implemented. The lapse in implementation is particularly true of the shortfall in Plan outlays for agriculture and rural sectors as well as those for the social sectors. In the central government's Plan outlay for the five-year period of the Eighth Plan, the Planning Commission had visualised 5.1 per cent of the total central outlay for agriculture, 11 per cent for rural development and 13.9 per cent for social sectors, whereas during the first three years of the Plan, the union finance ministry has allocated corresponding proportions of only 3.9 per cent, 7.7 per cent and 10.5 per cent for the respective sectors. These reduced proportions are themselves out of the reduced aggregate outlays in real terms. On the whole, the final outcome of economic and social development during the Eighth Plan period will have no resemblance to what has been projected in the Plan blueprint. In any case, the current developments are not based on any well-articulated strategy of industrialisation.

The absence of a broader developmental vision appears to be more acutely felt in regard to technology policy in the milieu of liberalisation. A survey of the relevant literature would suggest that India's technology policy has always lacked dynamism, that repetitive importation of technology has been a feature of the country's technological development. This was the position during the 1960s and 1970s when importation of technology was somewhat restrictive. This was also the position during the 1980s when there was a significant liberalisation in regard to foreign collaboration approvals. A detailed study of R and D activities to expand technological base of industries during the latter part of the 1980s argues that liberalisation took place on the premise that three elements, namely, firm size, degree of competition and presence of foreign capital, would have a positive impact on such activities but the authors found that (a) foreign

equity was negatively associated with R and D activities, (b) the influence of a firm's size on R and D was also found to be negative, and (c) the degree of competition and propensity to export were found to have no relationship to R and D intensity [Alam et al 1993] Against this background, another study by Narasimhan (1994) based on the experiences of the so-called east Asian miracle and also the recent misgivings expressed in the US regarding the role of multinational corporations in advancing America's own national goals (after the European and Japanese MNCs have acquired a commanding position in the American market[7]) argues that "market forces left to themselves will not help a country to acquire technological competence and strength to meet its strategic needs Nor can a country hope to achieve this by opening its doors to multinational enterprises (MNEs) without any constraints" What is desired is a multifaceted technology policy with a careful blending of promoting indigenous technology and transfer of advanced foreign technologies the latter essentially constituting a means of achieving the former For this a well thought out institutional structure within the government domain is necessary to acquire what Narasimhan (1994) calls technology literacy that is a thorough understanding of the potentials and implications of existing and emerging technologies and dissemination of that knowledge amongst the entrepreneurs in the country In this context the abolition of the Directorate General of Technical Development (DGTD) within the ministry of industrial development effective from April 1 does not speak well of the government's attitude towards technology development in the country In addition as Narasimhan has lamented the public sector which has shown an improvement in the average propensity to adapt with better research consciousness and R and D activities and which has emerged as a major supplier of technologies to other firms in India [Mani 1993]' has not only fallen from the grace, but is being positively discriminated against whatever national technological capabilities had been built over the years—especially in design consultancy and management—are now being allowed to wither away due to neglect and absence of support

(ii) *Wrong Sequencing of Reforms*

As a result of the mismatch between the macro-economic goals and the sequencing of reforms, serious distortions, contradictions and inconsistencies have surfaced in economic management For instance one of the most crucial objectives of stabilisation policies has been to achieve drastic reductions in gross fiscal deficit, revenue deficit and even budget deficit Important prerequisites for achieving this recognisedly are (a) a decisive curbing of non-development expenditures, and (b) widening of the tax base While efforts made in both of these directions have been niggardly, surrendering of revenues through all round reductions in tax rates has made the task of achieving fiscal correction almost impossible in the near future In expenditure compression, whatever has been achieved so far relates to the contraction of Plan or capital expenditures which has hurt the current and prospective growth potential of the Indian economy

Drastic tax reductions have been effected with the pious hope that lower tax rates would lead to better tax compliance and higher resources but such hope has no basis in the Indian or any other country experience As a result the expectations are that the gross fiscal deficit which was originally at 8 4 per cent of GDP on the eve of the reform programme in 1990 91 and which was targeted to be brought down to 4 per cent of GDP by now has come back close to 7 per cent in 1994 95 if we take account of the loss in revenues and increases in non development expenditures not provided for in the central budget It may be recalled that the Eighth Plan had visualised an increase in the ratio of direct and indirect taxes to GDP from 17 13 per cent in 1991 92 to 19 83 per cent in 1996 97 (the latter at 1991-92 prices) But the central government has set the trend of reducing tax to GDP ratios and hence despite some efforts on the part of state governments the overall tax to GDP ratios will not rise as conceived in the Eighth Plan document The central government's gross tax revenue as percentage of GDP has steadily declined from 10 9 per cent in 1990 91/1991 92 to 9 6 per cent in 1994-95 (the latter is likely to be still lower in reality in its final outcome)

The surrendering of large revenues before setting out the prerequisites for it has prevented the government from achieving more overriding fiscal reforms like the elimination of revenue deficits and containment of conventional budget deficits Against this background, even the proceeds from the sale of equities of public sector undertakings (PSUs) by the government are being used to finance consumption or revenue expenditures whereas it should not have been undertaken until there was an assurance that they would be used to build further capital assets

Secondly a more damaging aspect of the improper sequencing relates to compression of the government's capital expenditure and contraction of public investment activities generally before preparing the ground for the private and foreign sectors to fill the gap at the margin The gap is not only in the form of the size of investment but more significantly it is in the nature of investment The public sector investment has essentially been in basic and capital goods sectors which had provided a significant impetus to the growth of electrical and non-electrical machinery and other metal-based industries The blind pursuit of fiscal compression and retrenchment of public sector investment, without a well articulated strategy for industrialisation, has already begun to hurt the foundation already laid in this respect, apart from an industrial recession of an unprecedented magnitude It will take quite a few years before private and foreign sector investments begin to fill the gap What is more even the gap so filled is unlikely to be in areas of heavy industries with advanced technologies on a significant scale, thus corroding the base of India's industrial advancement assiduously built during the first 40 years of planning India may for instance, see substantial investment in power projects in the future but much the larger part of the power machinery may have to be imported This is true of almost all infrastructural areas such as petroleum refinery telecommunications and port development

This brings us to the third question of flawed sequencing namely, liberal imports of capital goods before adopting a strategy for technological advancement of the domestic capital goods sector The latter was necessary even for adopting an export-oriented strategy of development While fuller details regarding the investment strategy of the private sector are not available stray details do suggest that a preponderant part of the sector's investment will be in consumer goods and office equipment oriented industries (of course other than petrochemicals and telecommunications) As for the foreign direct investment, the details put out by the government present an unduly discouraging scenario in this respect In the first place, total foreign investment approvals accorded up to the end of December 1993 aggregated an amount of Rs 13,161 crore (about US $ 4 2 billion) but almost all of them are of small sizes[4] In the electrical equipment area, for instance as many as 651 financial and technical foreign collaboration agreements have been approved but the foreign direct investment (FDI) involved in them would be of the order of Rs 1,103 7 crore ($ 356 million) giving an average FDI of less than Rs 2 crore each In fact, under the food processing industries both the average and total investment proposals are higher in size a total FDI of Rs 1 347 9 crore for 196 proposals and an average of Rs 6 88 crore each The substance of this evidence points to the fact that public investment in heavy and higher technology based industries is being curtailed without the assurance of commensurate investment from private and foreign sectors Suggesting that the country has a comparative advantage in

engineering industry products and emphasising the need for technological upgradation, the Eighth Plan had proposed that "greater stress would need to be laid on import of drawings and designs than on import of equipment But the government policy on imports of capital goods including second hand ones has completely negated this Eighth Plan perspective

Fourthly a substantial part of the growing revenue deficit of the central budget is attributable to additional interest burden borne by it, which is in turn linked to the drastic increases effected in the yield rates on treasury bills and government securities as part of the financial sector reforms Simultaneously, the scheduled commercial banks have been subjected to enhanced capital adequacy norms as per the standards set by the Bank for International Settlements (BIS), more rigorous income recognition norms, assets classification provisioning of bad debts on a prudential basis and to accounting standards for investments All of these have imposed an onerous burden on the banking industry with almost near disastrous consequences on the banks operations The banks' lending rates have remained high and the commercial banks have been extremely reluctant to expand bank credit which has further gone to reinforce the recessionary conditions in Indian industry For the fear of violating capital adequacy norms and for generally protecting their bottomline the banks are all the more reluctant to lend to agriculture and rural industries, thus jeopardising the entire credit delivery system in rural areas These elements of financial sector reforms prematurely undertaken despite experiences of the south-east Asian countries to the contrary have undoubtedly produced the most deleterious effects on industrial and agricultural investment and production activities in the country

Fifthly one of the most harmful measures undertaken has been the permission granted to foreign institutional investors (FIIs) to undertake portfolio investment up to as much as 24 per cent of a company's equity base Apart from the fears it has generated in the minds of the Indian industrialists regarding possible takeover bids the measure combined with the companies borrowing from abroad has created serious macro-economic imbalances in the economic system The overall servicing burden for these kinds of foreign liabilities is also much higher than that on normal debt obligations

(iii) *Pace of Reforms Too Hasty*

Considering the fact that the public sector had been the prime mover in industrial investment any attempt to replace such investment by private and foreign sectors required thoughtful pacing so that appropriate institutional changes could be introduced to absorb the shocks Some of the glaring examples are in the field of government revenues surrendered through customs and excise duty reductions As a result of the sharp reductions in customs duties on capital goods within a period of three years to 25 per cent generally and even lower at nil rates for fertiliser projects and 20 per cent for power projects, the investment and production plans of domestic capital goods industries have been placed in jeopardy Redesigning of such plans requires a few years of concerted efforts The drastic changes effected have produced serious consequences for the health of these industries as capacity utilisation in many of them would suffer, their production cost would go up and it would make them further non-competitive, as major units in fertiliser, power and textile machineries have begun to feel the pinch

The pace of reforms has been inspired by what may be termed as an invidious goal which is to globalise the Indian economy rather quickly Every aspect of the new economic reforms has been conditioned by this rather premature and dangerous objective The effective rate of protection has been brought down rather drastically with rapid reductions in customs duties and removal of quantitative restrictions on almost all imports which in turn has compelled the government to radically bring down the excise duty rates on domestic industries, thus making the government surrender huge revenues A technologically sophisticated manufacturing activity for domestic production and exports requires not unrestrained imports of all and sundry products but a carefully designed import substitution policy so that indigenous technology grows in strength and provides the base for it

The pace of reforms has been similarly drastic in the financial sector area which has contributed to reducing the financial system to a moribund state insofar as the system's primary responsibility of providing productive credit is concerned An acute reluctance on the part of the scheduled commercial banks to lend generally and to lend rural credit in particular is sure to have drastic consequences for production and investment activities in agriculture and rural industries, as also industries in general in the near future At the same time, the premature grant of permission to FIIs to invest in the Indian capital market has created many adverse consequences unduly high price-earning ratios for the major scrips in the stock markets, expensive acquisition of unpro

ductive foreign assets, and generation of excess liquidity that threatens further the goal of price stability in the domestic economy

The serious consequences of the goal of globalisation has been the rapid deterioration in the quality of industrial structure—a phenomenon which may be described as deindustrialisation A sharp reduction in industrial growth, reduction in the growth of capital goods industries, a relative shift of exports away from manufactures, and arresting of the growth of industrial employment, have been some of the glaring effects of rapid reforms without providing for some breathing time and appropriate checks and balances for the Indian industry

(iv) *Prerequisites of Reforms Ignored*

The entire east Asian experience of stabilisation and structural adjustment policies has one unique lesson which is that the shocks of new policies are better absorbed and that their consequences for the levels of living for the masses can be minimised if the society enjoys certain minimal social standards of health and educational attainments In this respect the literature is full of evidences as to how countries like South Korea, Malaysia, Indonesia and Thailand had possessed higher levels of human development indices—literacy rates and women literacy in particular and infant mortality and maternal mortality rates—as also more egalitarian socio economic structures due to land reforms and such other measures before they embarked on significant adjustment programmes On the other hand the Indian situation is quite the contrary as brought out by the UNDP's latest *Human Development Report 1993* [see also *EPW* Research Foundation 1994]

(v) *Absence of Safety Nets*

The fact that Indian society, particularly its poorer segments, was ill-equipped to face and absorb the shocks of new policies required the institution of a fairly comprehensive structure of safety nets In this respect, it indeed appears a tragedy that the government of India should bring to bear such a narrow perspective on the broader theme of 'adjustment with human face' Their conception of this useful strategy has not gone beyond the provision of some extra financial resources through what has come to be known as the National Renewal Fund (NRF) which has been designed essentially as a resource to implement the voluntary retirement schemes for employees of public sector undertakings (PSUs) and also for financing training and counselling Though there were promises of commitment to minimise the burden of adjustment on the poor and of providing credible programmes of direct government intervention with quality social services such as education, health, safe drinking water and roads, as also of larger resources for agricultural and rural sectors, the initial rhetoric has not been matched by allocation of sufficient resources and programmes in these sectors

By its very nature, the adjustment with human face requires concerted efforts to protect the vulnerable segments, sectors and sections of society This is all the more necessary because the additional employment opportunities which are the only source of succour for the poor are found in the period of adjustment, only in agriculture village and rural industries and other unorganised segments which require special attention through various public programmes and promotion of growth opportunities in them As a UNICEF report has clearly brought out there are six distinct elements in the broad theme of adjustment with a human face [Cornia, Jolly and Stewart 1987] [5] The report emphasises the requirement of expansionary macro policies to sustain the levels of output, investment and satisfaction of human needs, meso policies designed to maintain the basic standards of the poor by improving distribution of incomes and resources promoting opportunities, resources and productivity in the small-scale segments of agriculture, industry and services, and compensatory programmes to protect the basic living standards, health and nutrition of the vulnerable groups These broader issues have remained neglected in India's current phase of adjustment with serious consequences for both the size and quality of growth in the medium term

Notes

1 The basic data buttressing these arguments as also substantive analytical issues involved in them have been presented (a) in a set of Special Statistics on the finances of the government of India in the issue of April 16 23 1994 and (b) in *EPW* Research Foundation (1994)

2 This note does not purport to deal with the Korean and Japanese experiences in their totality As is widely known there are a number of institutional cultural and other factors germane to the study of these experiences including the role of powerful industrial conglomerates in Korea (Chaebol) and Japan (Zaibatsu) Interestingly Korea did not have any exit policy as the government did not allow bankruptcies [Leipziger 1988(b)]

3 Mani s results are not quoted in Narasimhan (1994) Though there are conflicting results in literature on government s technology policy (see Gumaste (1993) and Suvrathan (1993)) the need for an interventionist strategy on technology import assimilation imitation and diffusion is not disputed

4 Though details regarding total project costs are not available small size nature of individual FDIs is self-evident from the description of the foreign collaboration proposals put out by the government through the *SIA News Letter* (various issues Government of India Secretariat for Industrial Approvals Department of Industrial Development)

5 The six elements have been reproduced in Seetha Prabhu (1994)

Meerut Firing: A Turning Point?

Amaresh Misra

The response of the dalits to the recent police firing on them in Meerut, which seems to be acquiring a mass dimension, may have heralded a turning point for the political situation in UP

IN UP, a new spectre is suddenly haunting the already turbulent political situation of the state. In the closing days of March, national and state newspapers were full of the incident of police firing on protesting dalits in the western UP city of Meerut which left two dead and scores injured. The dalits were protesting against the attempts of the city administration to remove the statue of Ambedkar which they had installed in a suburban area.

But what followed was truly unprecedented. For successive days curfew had to be imposed in the district as clashes continued with the police. The latter resorted to firing again on a number of occasions, yet the situation could not be controlled fully. Reports emanating from Meerut speak of the incident acquiring a mass dimension with dalit militancy directly confronting and ready to take on the state power. This clearly marks a break from the hitherto familiar version of dalit atrocities and resistance in the state. Up till now these were limited to rural clashes between the landed gentry and the dalits mainly on the issue of land and social respectability. Here the state was either a neutral entity or in the present case (a friendly SP BSP government) was seen as favourable to the dalits. Indeed, the response of the Mulayam government on many occasions was to transfer or suspend the erring officials and issue stern warnings against any failure to protect the weaker sections. The BSP also was very vocal on this question and even at times went to the extent of threatening the UP government if it failed to protect the dalit interests.

But in Meerut the issue of urban land claimed presumably by powerful interests brought the dalits face to face with the organised elements of the state power. And the same chief minister who had condemned previous atrocities against the dalits went as far as to defend the acts of the administration. He refused all demands for a judicial enquiry into the matter and turned down the proposal for a Meerut visit of an all-party delegation of legislatures. Even when the demand for a judicial enquiry has been belatedly acceded the punishment of officials is being deferred on the plea that it would offend the election commission as there is a by election due in the state. On the other hand the BSP is strangely quiet—it has yet to issue a strong condemnation of the incident and it seems that the SP BSP government, for all its rhetoric, has finally given in to the demands of the existing state machinery. The state leadership of the BSP has expressed apprehension that dalit militancy is exceeding the bounds set by it and it may not be possible to continue to back it while remaining in power. At another level, it is becoming more and more apparent that Mulayam Singh is now projecting himself as the best protector of the status quo. The Meerut incident in this context may prove to a turning point both with regard to the ongoing process of dalit assertion and its relation with the present government.

The police firing on dalits has occurred at a time when things seemed to be going perfectly well for Mulayam Singh. Months ago, when UP gave a resounding rebuff to the BJP, it was Kanshi Ram's BSP that received the maximum mileage from the event. Despite assuming the chair of the chief minister, Mulayam Singh Yadav had to remain content with a background role while the centre stage was occupied by a party whose organised dalit assertion was being widely regarded as a part of the larger backward-dalit-Muslim equation that worsted the BJP. But with the Janata Dal's splitting (about one-third of its legislators broke away with the intention of joining Mulayam while its state chief resigned), the situation was practically reversed. While Mulayam Singh's party got the maximum benefit, the BSP was left with a lot of problems. Its reputation was already suffering due to the continued attacks on dalits in the rural areas—in fact, many of its comments, like the one attacking Gandhi for labelling the dalit masses as harijans (made by the BSP leader, Mayavati), can be seen as guided by the purpose of deflecting attention from a failure on this front. This is also the context of Kanshi Ram's recent statements about starting a 'bahujan religion' to heal the wounds of the dalits and to prevent them from 'joining Buddhism'.

But such measures did not bring any substantial gains for the BSP. On the contrary it was caught in a bind where a loss of grass roots appeal did not get compensated at the top-level politicking. Here it was pushed into a corner by Mulayam after the splits and mergers in the state. The situation changed so dramatically that recently a BSP minister in his speech in the assembly, began with a reference to Gandhi as the father of the nation. This was in apparent response to the heat and dust raised by Mayavati's statement the defence of which had earlier become a prestige issue with the BSP. In all this there was an obvious pressure from Mulayam's side for restraint and scaling down of belligerence *vis-a vis* the upper castes and their sentiments which the BSP can ignore only at its peril. At present, even if the BSP decides to withdraw support to the Mulayam government, there is no guarantee that all its MLAs will stand by it. Amongst the social forces, the backwards and Muslims are already exhibiting a tilt towards Mulayam Singh, and at best the party may be able to retain its dalit base.

But Mulayam Singh has also benefited greatly from the drift and disarray in other parties including the BJP. The split in the CPI has already been given a formal, irreversible shape—in an interview published after the incident, Mitrasen Yadav, the erstwhile CPI state secretary and the breakaway leader, explained the redundancy of the CPI in the present context when a force like Samajwadi Party is already 'fulfilling' tasks like combating communalism, etc, which form the main agenda of the CPI. Here Yadav stuck a note which is fast becoming a common realisation, namely, the impossibility of two or more parties existing simultaneously with more or less the same programme and policies. There is a lesson here for parties like the CPM who too have few features left to distinguish them from centrist parties. However, the question as to which force will represent the social forces that captured power in UP in national politics is still unresolved and here the possibility of Kanshi Ram combining with V P Singh cannot be ruled out.

No less interesting has been the gradual transformation of the BJP—from a belligerent outfit unwilling to concede defeat in December and January to a party forced to take stands contrary to its own pronouncements. In the controversy over Mayavati's comments, the BJP leader Kalyan Singh was often reduced to a ridiculous position in the state assembly when he stood up to address Gandhi as the father of the nation. During the heydays of the mandir euphoria, the BJP had belittled Gandhi's status by categorically refusing to regard him as 'rashtrapita'. And now the expedient reversal in semantics naturally evoked more amusement than a serious note. Otherwise also the BJP is finding itself hard pressed to remain in the limelight and even the renewed rhetoric about the mandir issue lacks concrete proposals for the date of temple construction, etc. Yet for the BJP a new possibility has arisen with prospects of an alliance with Chandrashekhar who has

given several calls to include the BJP in the wider opposition struggle against the Dunkel Draft In this it seems that Dunkel is probably an excuse for something else—the BJP in any case is supportive of the new economic policy, hence its anti-Dunkelism can hardly be taken seriously What it does need at present is a further consolidation of upper caste and particularly 'thakur' power groups Even if nothing much can be read in the installation of a Hindi-belt personality like Rajendra Singh as the RSS chief, a position that was hitherto known as the exclusive preserve of the Maharashtrian brahmins, it is certain that the political calculations in north India must have played an important part in the decision After all Chandrashekhar too is fast losing relevance in the polarised situation of the state, and an alliance may come in handy for both

The chief minister's position is also being buttressed by the covert support of the Congress, for which a figure with few ambitions at the national level and a political plank not very remote from that of the party is perhaps best suited to hold the reins in UP for the time being Indeed, despite all initial appeals for backward caste-dalit solidarity, Mulayam Singh's pronouncements, as witnessed in the stand over the Mayavati episode, are veering more and more towards placating the upper castes In his speeches the chief minister is making it a point to term himself as a true 'sanatani' Hindu who has taken up the role of protecting the Muslims At another level, the chief minister has scaled down his attacks against the Dunkel Draft and is reiterating the position of the Congress on many questions

These twin processes, the consolidation of Mulayam Singh on the one hand and his 'status quoisation' of sorts on the other, are going hand in hand and it is quite early to predict what effect all this will have on his mass and political appeal Yet, episodes like the Meerut firing have opened the space for an oppositional slot Seizing this opportunity, the IPF-CPI(ML) has announced, for the first time since the assembly elections, a programme of mass protests and has declared its all-out opposition as different from an earlier position of conditional opposition It has also sent a team of the IPF affiliated Dalit Mahasabha to Meerut to conduct a full scale investigation in the matter

Netarhat Project

Biggest Ever Tribal Displacement

The year 1993, declared by the UN as the International Year of Indigenous People, turned out to be a year of fear and despair for the tribals of Gumla and Palamau districts of Bihar Towards the second half of the year they came to know of a government project that would make hundreds of thousands of them homeless and landless

THE declaration of 1993 as the International Year of the Indigenous People by the UN was meant to draw the world's attention to the problems of indigenous people and strengthen international co-operation for solution of their problems especially in such areas as human rights, environment, development, education, health and so on For the tribals of Gumla and Palamau districts of Bihar, however, the year 1993 turned out to be not one of hope but of despair, fear and nightmare as towards the second half of the year they came to know of a project that would make hundreds of thousands of their tribesmen homeless and landless

The project is aimed at acquiring tribal land for field firing and artillery practices for the 23rd Artillery Brigade The army had been practising field firing in the Netarhat plateau since 1956 In 1981-82 a move was made by the army to acquire the area under reference but due to strong opposition from the people and the local politicians, acquisition was kept at abeyance Having failed in the objective, the army and the government, both central and state, took recourse to the Manoeuvres Field Firing and Artillery Practices Act, 1938 (Act V of 1938) and under section 9(1) of the said Act issued a notification (SO 84 dated March 28, 1992) which reads as follows

> In exercise of the powers conferred by Sub Section(1) of Section 1 of the Manoeuvres Field Firing and Artillery Practices Act 1938 (Act V of 1938) the governor of Bihar is pleased to define the entire area specified in Schedule I and II below as the areas within which for a period of ten years commencing from 12th May 1992 and ending with May 2002, the carrying out periodically of field firing and artillery practice may be authorised
>
> The land plan may be inspected in the office of the Deputy Commissioner, Gumla/Palamau

The two schedules referred to above include 156 villages (127 villages in Gumla district and 19 in Palamau Similar notification was also issued earlier in November 1991 (Nos SO 761 and 762, dated 25 11 91) which included 89 villages of which 66 villages were in Gumla and 23 in Palamau districts In all then 245 villages are affected by the project as per the above two notifications

These are the only notifications of which tribals have been so far aware of but it is feared that some more notifications are either in the offing or have already been issued earlier but they have not been able to get hold of those notifications The fear is based on the fact that the army sources are giving conflicting figures regarding the area going to be affected by the said project Whereas one source puts the figure at 188 sq km, the other estimates it at 1 471 sq km And since the latter comes from the PRO (army), ministry of defence it is believed to be more reliable Even if no additional villages are going to be brought under the project the number of villages population and the area going to be affected are likely to be the largest in the history of Chotanagpur in independent India According to army sources the project will displace only about 27 853 people but the Chawni Visthapan Sangharsh Samiti Palamau estimates people to be affected at 2 24 940 of which 1 75,952 (nearly 78 per cent) are tribals belonging to such communities as the Oraon, Munda, Birjia Kisan Kherwar Asur Korwa, Birhor, etc In view of another figure which estimates the people to be affected from 156 villages (under the second notification) at 1,73 000, the claims made by Chawni Visthapan Sangharsh Samiti seem fairly reliable

There are no other communities in India that have been as adversely affected by governmental and non governmental projects as the tribal communities and even among the tribal communities there are no other communities that have been as adversely hit by such projects as the tribals of Jharkhand region in general and Chotanagpur in particular For the tribals of Chotanagpur, problems such as these began with colonial rule and administration However it is during the post independent period of national construction that the problem assumed a serious proportion During the period Chotanagpur and its adjoining areas saw rapid expansion of mining industrial hydel and other projects and whereas these symbolised national pride and progress for the rest of the country's population, for the tribals of the region these symbolised nothing but degradation destitution and death as benefits arising from these projects hardly touched them It is estimated that of the 185 lakh people displaced by various projects between 1951 and 1990 only 52 5 lakh have been resettled For the remaining 132 5 lakh resettlement still remains a distant dream Interestingly of the 185 lakh displaced as large as 75 per cent are stated to be the tribals

Of the hundreds of projects that have been initiated in the region none can match Netarhat Field and Firing Project with re

spect to the range of displacement. That is, the number of villages, families and people affected by each of the major projects in the past stood nowhere in comparison to that going to be affected by the Netarhat project. To illustrate, Tata Iron and Steel had displaced only four villages when it was started in 1907. As against this, the Rourkela steel plant started in 1956 displaced 2,465 families from 32 villages; the Heavy Engineering Corporation, Hatia, displaced 12,990 families from 25 villages; and the Bokaro Steel Plant displaced 12,487 families from 46 villages. In comparison, Netarhat Field and Firing Project is expected to displace 245 villages with a population of over 2 lakh people.

Notwithstanding the constitutional provision for preserving and protecting the tribal interest and lofty claims made by successive governments to this effect, the overriding and persistent feature of government policy and programmes with regard to tribals in general and the Jharkhand region in particular has been one of oppression and destabilisation. The Netarhat project is one more addition to this long chain of destabilising projects. All the same it throws open many disquieting questions.

In view of the scale of displacement and the dismal record of rehabilitation, the tribals of Chotanagpur have every reason to be angry and agitated over the Netarhat project. Indeed, it has sent a wave of resentment all through the Chotanagpur region. The indignation and resentment this time is much more intense than in the past as the government has given enough signal to convey that it values non-tribals' interest more dearly than those of the tribals; otherwise there was no reason as to why the proposed site of the project should have been shifted from Gaya in central Bihar to Palamau and Gumla districts in Chotanagpur. It is the ground on which the shift has been made that the tribals find the most disturbing. Of the two reasons mentioned one pertains to the scale of displacement. It is feared that the scale of displacement will be large if the project is continued at Gaya. Thus, whereas the national leaders and policy-makers have sympathy for the people of Gaya because of the scale of displacement, they hold no such sympathy for the tribals of Chotanagpur who have been subject to enormous displacement ever since the planned development began in 1950s. The other ground (destruction of historical monument) on which shift has been made smacks of ethnocentrism. It assumes that tribals have no history, no culture and therefore no cultural heritage. The fact that tribals have been living there for centuries with history, culture and heritage of their own seems to find no place in their scheme of history. What they show is an utter disregard for the sacred groves, place of worship, cemeteries, burial grounds where the tribals' ancestors have been buried and with which tribals have deep religious and cultural affinity. It is a paradox that history and monuments of one set of people are being destroyed with a view to preserve and protect the history and monuments of another set of people.

One of the most serious problems that tribals in India suffer from is the alienation of land from tribals to non-tribals and ways and means through which such transfer has taken place in the past have been well documented in the studies on tribes. Legislative and administrative measures drawn by the respective state governments for protection of tribal land is to be understood within this background. The protection of tribal land has also been reiterated from time to time in the chief ministers' conferences. Whereas these legislative and administrative measures have restrained alienation of land from tribals to non-tribals to some extent, the alienation of tribal land through state-sponsored projects has increased manifold. But what is even more disturbing is that government itself has often resorted to coercive and even secretive means. The Netarhat project is a pointer in this direction. In view of the fact that tribals are largely illiterate and suffer from ignorance of law and administrative procedures, measures adopted by the government in case of Netarhat project becomes not only objectionable but also a matter of great concern.

Notwithstanding constitutional, legal and administrative safeguards, why is it that tribal land has been made target for the purpose of the above project? Why is it that the normal course and procedures for land acquisition were flouted in the case of the project under reference? Why is it that notification of such importance as the one referred to above was kept secret? Tribals came to know of the project by mere coincidence. Why is it that the district and block officials maintain ignorance of such a notification even today? All these speak volumes for the clandestine way in which government has been trying to acquire the tribal land.

In fact, the silence being maintained by the government regarding the project has led to utter confusion among the tribals of Palamau and Gumla. Villagers have so far received no official communication. They have no idea as to when they are likely to be served notice of eviction and when and where they are going to be rehabilitated. It has been time and again emphasised by the government that tribals must be given land and adequately rehabilitated before they are evicted from the land. The question is whether there is land available to rehabilitate lakhs of people to be affected by the project. As it is, there already lakhs of displaced persons who are still awaiting rehabilitation in Jharkhand region.

Meeting Challenge of Economic 'Reforms'

Signals from Two Trade Union Conferences

Tilak D Gupta

Although both CITU and AITUC seem intent on finding new forms of struggle to channelise the growing discontent and anger of the working class, no new models appear to have evolved from the movements waged by these central trade unions

PATNA, Bihar's state capital, was the venue of two all-India conferences of major left trade union centres The Centre for Indian Trade Unions (CITU), controlled by the CPI(M), held its eighth national conference at Patna from March 3 The 35th session of the All-India Trade Union Congress (AITUC) attached to the CPI closely followed, beginning from March 11

That the country's labour movement is passing through difficult times hardly needs elaboration The movements of the working class and the working people, mostly under left leadership, has so far been clearly unable to reverse the economic policies of the Narasimha Rao regime No wonder the finance minister, Manmohan Singh, boasts that India has been exceptionally successful in implementing its agenda of economic reform without generating much social tension

Many eyes were therefore focused on the proceedings of the two major left trade union conferences to note the latest responses of an important section of the Indian working class movement to the ongoing economic policies A substantial chunk of workers looked forward to a new lead to be given by the CITU and AITUC leaderships in their arduous battles ahead The investors, foreign and native, were also keeping a close watch on the deliberations of the trade union meets to gauge the current mood of the Indian working class

Theoretically speaking, the perceptions of the CITU and AITUC, emerging from their respective conferences about the tasks in hand appear more or less similar There was increasing stress on developing a broader trade union unity to meet the challenges thrown up by the IMF-World Bank dictated economic reforms In the same vein, both the conferences felt that the working class alone, on its own, is not in a position to beat back the government's economic policies that affect the toiling people of the country as a whole Consequently, the CITU as well as the AITUC urged further efforts to build the broadest possible unity of the working people on an all-India scale, in the course of waging joint struggles

That the conventional forms of labour movement were proving inadequate in the face of the sustained onslaught of the Indian state and ruling classes was also seemingly recognised by both these central trade unions As a report on the CITU conference published in the March 20 issue of *People's Democracy*, the CPI(M) central organ, puts it, "the whole discussions during the conference centred on the search for new forms of struggle" In the AITUC rally at Patna, Indrajit Gupta and A B Bardhan, the two top CPI leaders, dwelt at length on the issue of giving a militant turn to the working class movement in order to resist the anti-people policies of the government The AITUC conference, according to Bardhan, felt that it is "necessary to develop new forms of struggle which give expression to the worker's militancy and their potential for action" (*New Age*, March 27)

But on the question of giving concrete shape to these ideas it appeared that there are certain differences between the approach of CITU and AITUC To take the vexed issue of trade union unity, for example, the CITU envisages the building of a confederation of all central trade unions as the task of the time Answering pointed questions from the press, top CITU leaders like E Balanandan and M K Pandhe affirmed that the BJP and Congress controlled trade union centres are also expected to be a part of such a body According to the CITU leadership, the proposed confederation should function on the basis of consensus and each constituent shall retain its separate existence

The AITUC, on the other hand, has come out strongly in favour of complete merger of central trade unions into a single centre The AITUC conference felt that CITU's suggestion for forming a confederation "falls short of the demands of the present situation" (*N w Age*) But CITU leaders rule out the proposal for merger of central trade unions as an impracticable step at this juncture

As a matter of fact, a sober appraisal of the country's trade union movement indicates that neither a loose confederation nor merger among trade union centres is really on the cards The CITU sources acknowledge that no other central trade union has agreed to its confederation proposal Moreover, a loose confederation of trade unions having divergent ideological political allegiances and functioning on the basis of consensus may if at all formed, turn out to be a rather unwieldy instrument for mobilising the Indian working class

The more ambitious project of a single trade union centre cutting across ideological barriers as visualised by the AITUC seems even more improbable given the political plurality of Indian society Though the AITUC and the Hind Majdoor Sabha (HMS) have agreed in principle to merge into a single entity the actual merger may turn out to be a tough proposition in practice Political differences apart the vested interests of the corrupt trade union bureaucracy in the labour movement also pose a serious obstacle to any genuine unity effort

This is not to argue that the question of broad trade union unity has been prematurely brought on the agenda On the contrary, the need for such unity has been felt for long by perceptive observers of the Indian labour movement And the issue today assumes all the greater importance as the fragmented Indian working class finds itself unequal to the task of rolling back the renewed offensive of capital But the whole point is about taking a realistic approach to the question of trade union unity by summing up the past experiences

As it is the extent of unity even among the left trade unions has not exceeded the formation of a loose sponsoring committee of trade unions Moreover all shades of left unions do not have representation on this platform Beyond that the unity of the Indian trade union movement has been expressed only through occasional joint movements on few specific issues Plainly a lot of home work is called for to facilitate the growth of the broadest possible unity of the working class movement For one the attempts at unity from the top have to be matched by a corresponding painstaking effort to forge unity at the shop floor level in course of joint struggles

Secondly unity will not come the easy way without a determined fight against the collaborationist and corrupt trade union bureaucracy long entrenched in the Indian labour movement At this point, one deliberately avoids mentioning the need to fight economism and legalism as it demands a more fundamental political remoulding of the trade union movement itself The fact that the all India coal strike of January 31 originally planned as a joint venture eventually became only a CITU call only underscores the importance of sustained struggle against the collaborationist section of the Indian trade union leadership

As for building the broadest possible unity of the various sections of the people against the current economic policies, the task again is to evolve concrete slogans and develop models at local levels that may be emulated by the trade union movement. Going by the proceedings of the CITU and AITUC conferences it becomes apparent that this aspect scarcely received any attention. It is one thing to mobilise the various sections of the people under left influence for a day's demonstration at the state or national capital but quite another to forge a worker peasant youth alliance on a stable basis.

Further it calls for a deeper self introspection on the part of the trade union movement to understand why the struggles of the organised sector of the workers and employees evoke so little sympathy among the other sections of the people. That such lack of sympathy is partly due to the motivated propaganda of the ruling classes to isolate the organised sector of workers and employees is, of course, common knowledge. But it has to be acknowledged that the orientation of the trade union movement strongly biased towards the relatively privileged sections of the workforce has to an extent helped the government in its divisive game of pitting one section of the working people against another.

For instance, in many industries, even the left trade unions have stood in favour of recruiting the dependents of the existing labour force as opposed to the demands of contractual labourers or local people. In agro based industries, the usual custom has been to merely pass a formal resolution in support of jute or cane growers and go no further. As for the service sectors, precious little has been done to pay heed to the people's grievances regarding the poor quality of service for which the employees are also responsible. One can go on citing examples, but suffice it to say that without attending to such diverse problems unity of the working people will continue to be restricted to the occasional mobilisation of the party faithfuls for symbolic types of protest movements.

Although both CITU and AITUC seem intent on finding new forms of struggle to channelise the growing discontent and anger of the working class, no new models appear to have evolved from the movements waged by these central trade unions. It goes without saying that the trade union leaderships cannot, by themselves, discover new forms of struggle. What they can really do is to sum up the past movements to highlight and popularise the positive emerging models. The 'gherao' as a militant form of struggle, one may remember, emerged not out of trade union conferences but through the actual practice of left leaning workers engaged in fierce struggle. That no new models are any more arising out of the mainstream trade union movement despite the acute crisis faced by the Indian working class may be considered as a sure sign of the poor health of the existing central trade unions.

As for the new experiences emerging elsewhere the AITUC, rather than CITU, appears to be willing to learn from them. The AITUC leadership at least made positive references to the Kanodia Jute Mill phenomenon in West Bengal where the rank and file workers rebelling against the established trade unions have formed their own organisation and occupied the factory in an effort to continue production on their own.

Though the Kanodia struggle has drawn the attention of many for its success in evolving new forms of struggle and enlisting the support of broad sections of local people, the CITU leadership appeared extremely allergic to any reference to it. One can concede that AITUC, given its recent record, was perhaps paying only lip service to the Kanodia struggle, partly for embarrassing the CITU. It is also true that some circles, traditionally hostile to the workers interests, have used the Kanodia episode as a handle to put the CITU as well as the left front government, headed by the CPI(M), in a tight corner. But all these cannot justify the lack of a self-critical attitude on the part of a trade union centre that claims to represent the most militant sections of the Indian workers.

As it is, one therefore finds the left trade union centres only expressing their resolve to change the priorities in the battle plans in their just-concluded conferences. But given that such resolution adopted earlier continue to remain by and large unimplemented, serious doubts persist about their efficacy. Moreover, as the left trade unions propose to concentrate the struggle against the ongoing economic policies rather than their effects, it may discover that it calls for more fundamental reorientation of left politics, going beyond the confines of the trade union sphere.

Dissent and Democratic Practice

Attack on NBA Office

Bina Srinivasan

The unprovoked ransacking of the Baroda offices of the Narmada Bachao Andolan by the pro-dam lobby comprising both BJP and Congress(I) leaders is yet another shocking sign of the intolerance of dissent among the political leadership.

MARCH 21 1994 will go down in history as a black day for democratic traditions in Gujarat. It was on this day that the Baroda office of the Narmada Bachao Andolan was ransacked and its properties set on fire. A group of 15 men, accompanied by police and press photographers descended on the NBA office at around 1 a m and indulged in an act of vandalism. Among this group of people were ex-mayor Rajendra Rathod, BJP MLA Nalin Bhatt and Congress(I) member Yogesh Akolkar.

The immediate provocation for this action it was claimed, was the review team that had been announced by the environment minister Kamalnath on March 15. This was in response to the gherao by NBA activists of the minister in Delhi on the same day. The team was to look into the effects of the closure of sluice gates upon the submergence villages. Claiming to brook no interference in matters of SSP and the interests of Gujarat, workers of the BJP and Congress(I) had since then been camping at the Baroda airport hoping to give the review team a reception that would convey adequately to them that they were not welcome in Gujarat. In their enthusiasm the crowd at the airport had not bothered to identify the team members they were going to send packing. As a result they picked on persons who had absolutely nothing to do with either SSP or the NBA. The local press reported that "a friend of Medha Patkar had been sighted at the airport" who was then gheraoed and shouted at. This person "definitely was Medha Patkar's friend as she was dressed in a cotton sari and had hair clips and other ornaments much like the kind adivasi women wear". The local press played it up without mentioning the discomfort that this may have caused the woman, who could only leave with police escort. Rini Dhumal, a well known woman artist had not bargained

for this, when she went to the Harni airport to pick up another artist who was expected to arrive that day for a workshop organised in the Fine Arts Faculty. The mob that surrounded her had identified her as "one of those who usually accompanies Medha Patkar in Baroda" and refused to pay any heed to her pleas that she was only an artist. So much for determination to ensure that no review team member would set foot on Gujarat soil.

Frustrated in their attempts to thwart the review team—for nobody turned up—the BJP-Congress workers seized upon the information that two persons had arrived by the Sayaji Express and had proceeded to the NBA office from the railway station. At 1 a m, 15 people left the airport and went to the NBA office, accompanied by a police jeep. They demanded to see the 'review team members' who in this instance were Bagaram Tulpule, a long-standing trade unionist from Maharashtra and Shama from Pune. NBA activists, taken by surprise, denied that any such members were in the office and also said that they had no information about them. Their explanations fell on deaf ears. Yogesh Akolkar and the others surrounded Medha Patkar who happened to be in the office that day and shouted at her to leave Gujarat. She was an outsider, they said, having no right to create hurdles in the construction of SSP. They told her that they were being magnanimous in not causing her bodily harm since she was a woman. (The next day, local newspapers reported this as being indicative of the culture of Gujarat which accords respect to women!) Soon afterwards, they began pulling out files from the racks in the office and threw them on the road, a fan was lifted and flung down from the second floor, video cassettes, a slide projector and pamphlets followed. A group of people waiting on the road sprinkled kerosene on the jumbled heap and set fire to it. Hundreds of people lined up on balconies as they, along with the police, became mute spectators to the unnatural light cast by the bonfire on the main road in Dandia Bazar. The mob left with threats of more to come.

At 9.30 a m later that morning, a crowd of 50 persons gathered on the road again. Four to five persons climbed up the steep, rickety stairs leading to the NBA office and demanded that Medha Patkar and other activists leave the premises, or, they threatened, the crowd down below would get out of hand. They accused the NBA of taking foreign funds, of being outsiders and traitors to the cause of Gujarat. A heavy police contingent had arrived by then. The police joined in the persuasions. Leave for a short while and come back later they said. The police also pleaded helplessness in dealing with the meagre crowd below and said that they were apprehensive that a law and order situation would be created if the activists insisted on remaining in the office. The NBA activists had to therefore leave under heavy police bandobast.

The police had been joined by a contingent of the BSF. Indeed, it is difficult to believe that this large police force was not in a position to control the crowd. Since then, the NBA office has a virtual police chowky at its doorsteps. Access to the office was denied to the activists who have had to take police permission to get in.

The entire incident has left an ugly mark on politics in Gujarat. The skirmish for leadership that has ensued after the death of Chimanbhai Patel, former C M, has led to a situation where every political party is out to prove its credentials through the SSP issue. But the use of force and goondaism becomes inevitable when rational negotiations and discussions evoke a sense of fear, a sense of inadequacy. After all, those who favour the SSP have equal access to democratic expression, quite apart from having the backing of state itself. Instead of taking recourse to negotiations through informative exchanges, sections of the pro-dam lobby seems to be bent on treating it as an 'emotional' issue, which then can ignore, or distort democratic processes. Another plank of the pro-dam argument also disregards completely the basics of a democratic ethos. It is indicative of a rightward swing which chooses to exhibit an extreme intolerance when it comes to dissenting views.

Take for instance, their accusation that Medha Patkar is an outsider and has no business interfering in matters that concern Gujarat. Invoking the spirit of territorialism is an old ploy and has been used time and again to justify the domination of the haves over the have-nots. Yet, when the dispossessed raise the issue of territorial rights, domination is sought to be justified in the name of national interests. Besides, what are the parameters that determine who has the rights to represent people? If the people themselves have the right to choose their leaders and fora, then the adivasis it would seem are less equal than the industrialists and rich farmers of Gujarat. Much is being justified in the name of the people, what then of the well known fact that for years the people of Saurashtra have considered themselves distinct from the people of Gujarat? The merits and demerits of separatism is a different issue, but there certainly has to be some social and political accounting for the grievances of the people who have been historically oppressed and marginalised. The notion that there exists an overarching Gujarati identity which exerts a homogenising influence misses out on the complexities of a caste-ridden, class-based society. Besides, to argue that all non-Gujaratis are outsiders comes dangerously close to the contention that all minorities are 'foreigners'. What then of all the Gujaratis who have chosen to live outside the boundaries of the state? Or of those Gujaratis who have settled abroad and are even at this point victims of racial prejudice?

NBA activists are being called traitors to the cause of Gujarat, being so defined because of their opposition to the SSP. Here, it is being assumed that SSP represents that interest of the entire state But this glosses over the fact that there are as many truly Gujarati men and women who hold the opinion that SSP is not the solution to the water problems of Gujarat In addition, there are scores of people who oppose the SSP because, in their opinion, they stand to lose. What scope does the political process in Gujarat give to the aspirations of these people, who are as Gujarati as anyone else? A democratic set-up has to accommodate varying shades of political currents without destroying any one section To embark upon a path of physical intimidation simply because there is disagreement is to initiate a dangerous process, for which each and every person will have to pay a heavy price, no matter what their political inclinations

A brief note must be made here of the role played by the Gujarati press in this incident While there can be no doubt about its sectarian viewpoint, even granting that the press has a right to hold an opinion, it is difficult to condone the valorisation of an act of vandalism The sanctity of reportage lies in the fact that it at least records events as they occur and not present distorted, incomplete versions Newspapers can and have drawn their own conclusions on events, but it is incumbent upon the fourth estate to uphold democratic processes rather than applaud its destruction. That apart, the Gujarati press also seems to congratulate the persons involved on the machismo they have displayed by their action. Indeed, the entire incident is being portrayed as a indication of the 'mardangi' of Gujarati ethos Dissent has been crushed, dissenters warned, masculinity has triumphed The connections between this perceived triumph of masculinity and reportage of atrocities/crimes against women by these newspapers would, one is sure, reveal the workings of the very same political inclinations

Ammonia Storage Tank to be Decommissioned

K Aravindakshan

All political parties and trade unions including the Left in Kerala, have taken exception to the Kerala High Court directive to FACT, to decommission its ammonia storage facility because it is an environmental hazard

THE recent epoch-making judgment of Kerala High Court which barred appeal to the apex court on the public interest litigation case filed by a few environmental activists and Sarvodaya workers, directing the management of the Fertilisers and Chemicals Travancore (FACT) Udyogamandal, near Alwaye Ernakulam district to decommission its ammonia storage tank located in Wellington Island Cochin within three months has, presumably evoked mixed reaction While the environmentalists and social workers as well as the general public, besides a number of non governmental organisations (NGOs) like Desiya Shastra Vedi have whole heartedly welcomed the high court directive almost all the political parties and trade unions in the state including those of the Left, have predictably, come out with a barrage of criticism against the well-intentioned judgment

The Kerala legislative assembly during its budget session witnessed a curious scene obviously due to lack of proper floor co-ordination, where two members of the Opposition, one belonging to the CPI and the other to the CPI(M) the two leading constituents of the LDF pleaded with the speaker vociferously competing for permission to move the motion seeking adjournment of the proceedings to discuss the serious ramifications of the matter This seemingly unreasonable anxiety to steal the show was over a matter which had been hanging fire for quite some time And strangely enough the FACT authorities had done nothing to allay the legitimate fears of the public at large over this period which obviously forced the desperate and irate agitators to seek the intervention of the high court Why did none of the major political parties and trade unions owing allegiance to them fail to make any attempt to persuade the management of the company to seek viable alternatives for storing imported ammonia or to enhance its in house production at the appropriate time?

The trade union organisations under the joint auspices of the AITUC CITU, INTUC and a host of others had meanwhile organised a massive protest rally against the high court directive and offered dharna in the court premises in a vain bid to pressurise the high court to reconsider its ruling It is now learnt that the FACT management is contemplating filing a special leave petition before the Supreme Court the outcome of which is unpredictable The government of India, on its part is reported to be considering measures to shift the location of the huge ammonia storage tank which is easier said than done in view of the heavy financial commitment involved in it

It is true that if the high court order to decommission the 10,000-tonne storage tank in three months is going to be implemented, it can have serious implications for FACT, the largest importer of ammonia in the country Though the company meets half its daily requirements from in-house production, the authorities are worried that it would result in a shortfall in ammonia production by 8 lakh tonnes in fertilisers and 50,000 tonnes in caprolactum in one full year of operation The estimated production loss to FACT will be of the order of Rs 700 crore against the total turnover of the company during 1992-93 amounting to Rs 750 crore The poor turnover has been attributed to the sluggishness of the market and frequent changes in government policies Based on the track record of the first five months of the current financial year, the anticipated production loss will amount to several hundreds of crores of rupees

While FACT depends on 850 tonnes of imported ammonia everyday, its in-house production is only 750 tonnes The requirements of the urea plant are today met from in house production and so, the closure of the storage tank will definitely tell upon the production of a combination of fertilisers and ammonium phosphate

The anxiety of trade union organisations of various hues is understandable because the jobs of 5,000 employees are at stake as the immediate fall-out of the implementation of the court directive The FACT management is not only under pressure to approach the apex court with a special leave petition, but also to explore possibilities to bridge the gap in ammonia production The company proposes to approach the fertiliser units in the neighbouring states, like Mangalore Chemicals and Fertilisers (MCF) in Karnataka and the Southern Petrochemicals (SPIC) in Tuticorin in Tamil Nadu with a request to lease out the excess capacity in their tanks at least as a stop-gap arrangement Railway tankers will have to be acquired to transport ammonia from these locations However, it is not yet certain whether these two units do have excess capacity, and if it is available, whether these companies are willing to allow its use Another option being thought of is to assess the feasibility of tapping ships from the outer harbour at Kochi, pumping the ammonia into large barges and directly transporting supplies to the factory sites

Whatever be the alternative, the task is really stupendous mainly because the costs to be incurred will be prohibitive which the FACT management can ill-afford in the context of the poor financial performance of the company The production loss totalling Rs 700 crore would imply additional import of fertilisers and caprolactum involving the outgo of valuable foreign exchange, though our prime minister has declared the government's intention to import fertilisers, come what may

In the meanwhile, true to our national tradition of growing wiser after the event the Kerala industries minister P K Kunhalikutty stated in the state assembly that with almost 75 per cent of the ammonia intake of FACT being stored in Wellington Island, the company management was seeking three years' time to decommission the existing storage tank and to commission the company's own captive plant at an alternative site He also shared the concern expressed by the members of the assembly about the ultimate impact of the high court verdict on the jobs and livelihood of 5,000 employees directly and another 25,000 employees indirectly, spread over the whole of south India The entire farm sector in the southern states would be starved of ammonia-based fertilisers

It is also necessary to examine, in this connection, the real national ramifications of the high court ruling since they tend to transcend the boundaries of Kerala and can be quoted as a precedent against 22 or so similarly located ammonia storage tanks along the ports of Bombay, Mangalore, Madras, Goa, Tuticorin, Vizag Paradip and Kandla, to mention a few The storage tanks in these and other places serve as sources of ammonia supply to fertiliser plants like MCF, SPIC, Paradip Phosphates, Zuari Agro, and Rashtriya Chemicals, among others Maybe, most of these tanks have been set up much later than FACT's Wellington Island unit But the fact remains that eventually the fate of the other tanks will be no different The tanks at Madras, Tuticorin in Tamil Nadu and Kandla in Gujarat are older than that of FACT which was commissioned only in 1976 It is time that all these fertiliser companies woke up from their slumber and took steps to install their own captive ammonia production units, free from environmental hazards, as quickly as possible, so that their entire ammonia requirements can be met by in-house production Environmental activists in other states cannot be expected to sit quiet and allow things to drift If they too decide to approach the courts in their respective states, fertiliser production of all these plants will come to a standstill with serious repercussions, on the farming community

Social Explosion in France?

Raghu Krishnan

The protests of several hundreds of thousands of students, unemployed and semi-employed youth, teachers, trade unionists and social movement activists in March reveal the growing anger with government measures that intensify unemployment and social insecurity, especially among the youth.

THERE is much talk of 'social explosion' these days in France. In the last three weeks, several hundreds of thousands of post-secondary and high school students, unemployed and semi-employed youth, teachers, trade unionists and social movement activists have taken to the streets in protest. Coinciding with all the international fanfare around the G-7 'employment summit' in Detroit, the protests reveal growing anger with government measures that intensify problems of unemployment and social insecurity, especially among youth. They also reveal that the right-wing government and the country's elites have no qualms about turning to the police to shore up their increasingly discredited order.

'*On prefere descendre dans la rue qu'y finir*' ('We'd rather take to the streets than end up in them'). With this slogan, the first wave of student demonstrations last fall had set the tone for the current round of student and youth protest in the country.

The current right-wing government is haunted by images of May 1968 when student protests led to a month-long general strike of 10 million workers and created a situation that sent de Gaulle scampering over to Germany to see if he had the support of French troops stationed there. More recently, it was student protests that eventually led to the fall of the 1986-1988 right-wing government of the current mayor of Paris, Jacques Chirac.

The government of prime minister Edouard Balladur is all the more edgy because this is the latest and most widespread in a series of challenges that began last fall. It all got started with the strike at the public sector airline, Air France, where technical and service personnel went so far as to occupy runways at the Charles de Gaulle and Orly airports in Paris to demonstrate their opposition to job and salary-cutting measures. The government was forced to back down, and the head of Air France to resign. Nation-wide polls taken at the time showed majority support for the strikers' militant tactics. At the same time, the first signs of student unrest emerged in opposition to plans to cut back student housing grants, against underfunding of the education system and hiring cuts in the public service.

The next wave of protest arose in opposition to government plans to devote more public funds to the private (and largely Church-run) school system. On January 16, the largest demonstration since the late 1960s brought some 7,50,000 people from across the country to Paris, in defence of fully-funded, universally accessible and secular public schools. Once again, prime minister Balladur was forced to do an about-face.

In February, it was the turn of the Atlantic fishing communities to rise up against a bad situation made worse by the collapse of prices and government support that have accompanied the 'free trade' unleashed by the process of European unification and the recently concluded GATT negotiations. In the violent confrontations that ensued, the old parliament building in the provincial capital of Rennes was burned down by a stray flare or an exploding police tear gas canister.

And finally, just before the latest round of protests, violent clashes continued over several days in the suburbs of Paris, largely pitting the teenage children of Arab and Black immigrants against local police forces.

Cut-Rate Salaries

The object of the latest unrest is a package of government labour reforms—known as the 'CIP', the French initials for 'contract for professional integration'—that make it cheaper for employers to hire youth in all categories, including university and technical school graduates.

Although promoted by government spokespersons as a plan to fight unemployment, there is every reason to believe that the reforms will do nothing of the sort. Those youth hired at the proposed lower wage would often be merely replacing an older worker neatly disposed of through an early retirement package or simply dismissed. In other cases, many youth that would have been hired anyway at the full wage will now be hired—after six months of unemployment for degree-holders—at a wage anywhere between 20 per cent and 70 per cent lower than before, according to age and the level of post-secondary education.

A job 'created' in this way can last for a maximum of two years, after which time the employer can take the person on at full wage or hire another cut-rate youngster. It is not difficult to figure out that the employer will usually go for the latter option—if the position is filled at all, that is. And to make matters worse, the reform would further reduce the purchasing power of the general public in an already depressed economy.

An article in the daily *Le Monde* put it best: "The CIP does not so much create as it does generalise the [youth minimum wage], with a 20 per cent cut in the professional minimum wage for degree-holders. More generally, employment policy over the last 15 years has had hardly any effect on youth hiring, in spite of all the [tax and social security] exemptions offered to employers. At the same time, the over-50 age group has been massively oriented towards early retirement schemes. The result: access to employment is *de facto* reserved in the main for those between 30 and 50 years old."

The CIP blow has been hardest for the very students that bought all the arguments about the need for people with a technical education. Since the 1980s, middle-class youth in all the western industrialised countries have been told that this is the way to a secure future—and the way to lead their countries out of recession. Now, the government and employers are telling them that the economic and professional value of their degrees is not so great after all. And these technical graduates have seen their unemployment rate rise to 10 per cent, a five-fold increase in the last four years.

No surprise, then, that it is the sons and daughters of 'La France profonde'—white, middle-class families in cities and towns outside Paris—that now find themselves in the front lines of a showdown with the government and its police.

The Spark

But unemployment and insecurity run rampant through all categories of French youth. Nearly one-quarter of France's four million unemployed are under 25. Those with jobs find themselves increasingly in a part-time, unstable situation. The situation for the children of Arab and Black immigrants is even worse, and further aggravated by constant police harassment and the growing xenophobic climate in the country.

In a society that considers sexual activity and experimentation as a natural and healthy part of growing up and of life itself, the inability of authorities to deal with the AIDS

epidemic in anything but a moralistic, authoritarian and stop-gap manner has been cited as another major source of insecurity and frustration. A clear sign of this growing 'sexual discontent' among youth appeared just before the recent outbreak of student protest, after the government's radio and television authority announced it would be taking a popular youth phone-in sex and relationships councilling radio show off the air if it did not censor the language of people calling in.

The show, called 'Lovin' Fun' on the FM station 'Fun Radio', has a nightly audience of several millions, making it the most popular radio show in the country. Following the government announcement, there was an outpouring of support—calls, letters, faxes, spontaneous demonstrations—from thousands upon thousands of the programme's listeners. As a result, 'Lovin' Fun' is still on the air—live and uncensored.

Suffice it to say that a youth revolt was brewing in the country, and the CIP legislation provided the necessary spark. The dynamism and inventiveness of this movement would enliven even the dullest of spirits. Many high schools and colleges are on strike, some universities are occupied, and there are general assemblies to organise the movement and give everyone their say.

The demonstrations—that have taken place even in the smallest of communities—are specked with colourful banners and placards, with irreverent chants and songs filling the air. They have often headed to local high-speed train stations and highways—those symbols of the glorious 'modernisation' that has left them out—to hold up traffic or gently march in front of it to their next destination. Demonstrations in some of the bigger cities—Paris, Lyon, Toulouse, Lille, Nantes—have been joined by large contingents of high school youth and unemployed teenagers from the working class suburbs. These are often the largest and most militant contingents, and are certainly the most diverse in terms of their ethnic and gender composition.

'Les Beurs' and 'Les Blacks'

The participation of these youth from the working class and heavily immigrant 'banlieues' (suburbs) has increased the stakes of the stand-off, and touched the rawest nerve of the French right-wing. It seems there is nothing the country's rulers fear and hate more than the children of Arab and Black immigrants, all the more so if they are joined by their white class- and work-mates.

From the early- to mid-1980s, these children of immigrant workers were at the cutting edge of struggles for democracy and social justice. They have played a decisive role in each wave of mass youth protest that has followed their cross-country 'Marche des Beurs' ('Beurs' is slang for the children of Arab immigrants) and the 'Marche pour l'egalite'. The fact that their movement was betrayed and crudely co-opted by the Socialist Party government at the time—and then frontally attacked by the right-wing—has been a significant contributing factor to the current despair and disorientation in their ranks.

The response of the authorities to this new turn in the movement has been as predictable as it has been unfortunate. In reply to some isolated incidents of looting and stone-throwing, the government—in the shape of the arch-reactionary interior minister Charles Pasqua—attempted to justify its stepped up repression of the whole movement by decrying the presence of those who were allegedly trying to use it to further their own violent and criminal ends.

The racial overtones have been barely hidden. To drive the point home, two teenage students of Algerian origin, Mouloud Madaci and Abdelhakim Youbi—both in France for several years—were arrested after one of the demonstrations in Lyon and, without even a proper trial, expelled on a ship to Algeria.

The response of the protest movement, progressive lawyers and immigrant rights activists in Lyon was swift and inspiring, although thus far inadequate. Banners at the 30,000-strong March 25 demonstration against the CIP read 'Liberez nos camarades' ('Free our comrades') and had the names Abdel and Mouloud decorated with flowers and peace signs. Some 1,500 protestors camped out in front of court buildings and were there when the order came down from a national legal body: Mouloud and Abdel's expulsion was illegal; they were to be returned to French soil at once.

For the moment, however, the Lyon police have challenged the ruling, and the two teenagers are awaiting their return to France in the transit zone of the port of Algiers.

State's Violent Antics

For now, at least, attempts such as this to divide and break the movement have been ineffective

It certainly has not been for lack of trying though. There can be no getting over the lengths to which the police will go to break up demonstrations—water cannons, tear gas, plastic bullets, and charges of truncheon-swinging and helmeted police.

It is clear that the government wants the demonstrations to degenerate into a free for all, all the better to discredit the movement. The daily *Liberation* reports eyewitness accounts of bystanders at the March 25 Paris demonstration who said it was plain-clothes policemen who initially smashed shop windows, in order to justify another indiscriminate round of truncheon-swinging by their uniformed colleagues. On several occasions, uniformed and plain-clothed police alike have injured media photographers and cameramen in order to prevent them from capturing their antics on film.

What kind of society does a government that responds to the most vibrant and critical-minded segments of its youth in such a manner hope to build?

There will be another national day of student and youth demonstrations on March 31, with the possibility that everyone will head into Paris as is the custom when people want their message to be heard.

It is clear that the role of the labour movement is decisive if the government is to be stopped in its tracks. Seeing the CIP as a clear attack on their members and on workers' rights generally, the country's trade union federations staged their first united action since 1962, a nation-wide demonstration of some 2,00,000 people on March 12. Hopes are that this spirit of unity can be translated into some strike action—there is talk of a general strike in early April, to coincide with a national day of student demonstrations.

The role played by university arts and science students will also be a decisive factor. In May 1968 it was these students that played the leading role. Thus far, they have largely remained on the sidelines, with the idea that the CIP will not affect them. There have been some signs of movement, however. Late last week, for example, 600 students occupied university buildings at the Tolbiac campus of the University of Paris.

On April 6, a cross-country trek by the new 'Agir contre le chomage!' ('Act against unemployment!') campaign will begin. It is scheduled to end with a huge march on Paris at the end of May. The campaign involves trade unionists, unemployed activists, housing rights activists and people from the women's and other social and democratic movements. The campaign calls for a radical reduction in the working week with no reduction in pay—alongside increased taxes on corporations and speculation—as the only feasible and socially just way to massively reduce unemployment.

So the stage is set for at least another few weeks of struggle in the country. Whether a 'social explosion' is in the offing remains to be seen. There is a good chance the government will soon revoke the CIP legislation.

Whatever happens, the protest movement has certainly provided a much needed breath of fresh air.

March 27.

Making Sense of Government's Macro-Economic Stabilisation Strategy

Amiya Kumar Bagchi

While it may be doctrinally correct to criticise the government for not doing things that it could not reasonably be expected to do, it is not very sound political economy or economic sociology to harp on those failures It is much more fruitful to find out how and why the government has fashioned the particular strategy it is following

THE present Indian government has been accused of not promoting growth, not making a real dent on poverty, not seeking to bring down the burden of external debt and thereby eliminating the threat of yet again getting near a situation where foreign bankers would not honour Indian letters of credit, and finally not promoting technological self-reliance through an appropriate policy of innovation, adaptation and absorption of technology Suppose that all these accusations are true One reply would be that apart from the charge of not seeking to promote growth, the rest would also apply to the policies of most governments at the centre since the middle of the 1960s Which government's policies made a real dent on poverty? It is claimed that during the late 1980s the proportion of population living below the poverty line tended to decline But surely this was more a by-product of the growth-promoting policy of the Rajiv Gandhi government and the lucky occurrence of several good monsoons than of any properly target-oriented poverty eradication strategies And the near-default situation that India reached was a direct result of the policy of the Rajiv Gandhi government which sought to promote growth by borrowing heavily abroad So why should the new government take upon itself the task of promoting poverty reduction, technological self-reliance or a greater degree of independence when the immediately preceding one had not done so? Has its support base shifted towards a set of classes or groups which would feel aggrieved if growth is not accelerated, poverty is not reduced or dependence on external loans or aid is increased? Or, look at another aspect of its revenue and expenditure policies This government has further accelerated the process of revenue gathering through indirect taxes and administered prices and has made it clear that those who possess money-earning assets will continue to be favoured by the tax policies policies geared towards a creeping privatisation of public sector enterprises and further deregulation of the capital and money markets Again, some of the instruments for shovelling incomes towards the rich may be relatively novel, but is the general policy of favouring the rich and especially the up and coming dealers in money and assets who want to make money hand over fist all that different from the policies pursued by the undivided Janata Party government or the succeeding Congress governments? After all, it is the up and coming rich who provide the money muscle and media coverage lauding the achievements of this liberalising government who want to get India into the mainstream of liberalising policies as a means of allowing the Indian Joneses to imitate the life-styles of Donald Trump Adnan Khashoggi, Alan Bond or Ravi Tikkoo Money is needed in order for the government to be able to manipulate voters legislators and opinion-makers and the government cannot afford to alienate people who have money and who expect to continue making money and ever more money through the policies pursued by the government

So while it may be doctrinally correct to criticise the government for not doing things that it could not reasonably be expected to do, it is not very sound political economy or economic sociology to harp on those failures It is much more fruitful to find out how and why the government has fashioned the particular strategy it is following One answer is that all the elements of the strategy are worked out in Washington, DC But again that is not a fully adequate answer While there is a generic similarity between the structural adjustment policies (SAP in short) recommended for and imposed upon the different client nations of the IMF and the World Bank, there are also differences in the speeds with which the overall package of SAP or different elements of it are sought to be implemented in different countries Why such differences are allowed within the canon would be a fascinating but highly time consuming enquiry A shorter approximation is to be found in figuring out the areas in which departures from the recommended package have been allowed in the case of a particular country viz India whose policies are under discussion at the moment

In the Indian case departures have been allowed from the recommended package in two critical areas One of these is the budget deficit fiscal deficit revenue deficit or whatever other concept of deficit is used for a particular round of evaluation The deficits recorded by the revised budget of 1993 94 are way beyond those which had been targeted earlier and they are threatening to exceed all the earlier historical records The second area where departure has been permitted is full convertibility of the rupee after the bouts of devaluation in 1991 and the subsequent abolition of the dual exchange rate, the government has in effect maintained a fairly steady exchange rate for the rupee during the last two years and the Reserve Bank of India has intervened repeatedly in the market in order to keep the exchange rate within a fairly narrow band

Internal and External Balance

The government has in fact chosen one of the routes recommended by the Fleming-Mundell solution to the assignment problem under a regime of less than perfect capital mobility namely the use of monetary policy to achieve external balance and the use of fiscal policy to achieve internal balance The concept of balance will have to be defined of course in the current context of Indian political economy [1] Internal balance means fulfilling the income aspirations of the top 10 per cent of the income earners of the Indian population It does not matter if the aspirations of the other 90 per cent are frustrated They have no unique focal organisation which can be used to bend the government to their will Moreover large sections of the other 90 per cent are linked by various patron client relations to the politicians who claim to mediate between the top 10 and the bottom 90 per cent The fulfilment of aspirations of the top 10 per cent will also have to be interpreted in aggregate rather than sectional terms or in terms of universal satisfaction of aspirations Some

sections of the 10 per cent may lose out but the process of liberalisation opens up possibilities of mobility from the losing segment to the winning segment. Of course, such mobility is available only to those who belong to certain 'opportunity brackets', shall we say, in terms of income, assets, education, caste or community affiliation or political connection.

'External balance' is also to be interpreted not as an absence of a balance of payments deficit but as an acceptable combination of a maximum amount of balance of payments deficit, a minimum rate of reduction of the current trade deficit, and the building up of a substantial foreign exchange reserve. As in the case of the internal balance, the definition of the external balance is greatly dependent on the policy-makers' assessment of what their backers and their ultimate masters want. In this particular case, the backers are Indian and non-Indian traders and financiers who are likely to move liquid capital into India for speculation, but on a medium-term rather than a short-term basis, big foreign or Indian-owned companies who will want a piece of the action if the action is cheap and reasonably riskless, and, of course, the twin watchdogs of global capital, viz, the IMF and the World Bank.

Among the troubles the government confronted in June 1991 the most dangerous in its view was the slimness of foreign exchange reserves, the drying up of all sources of long-term and even short-term accommodation finance from foreign banks or foreign suppliers; associated with that was an enormous amount of outflow of hot money from India. It was no consolation for the government to know that much of that outflow was triggered by expectation of an imminent dose of devaluation. As a way of confidence-building with the twin Washington watchdogs (which was also a way of reassuring the operators in the hot money market about the orthodox inclination of the policy-makers), the government undertook the two-step devaluation of the rupee and the introduction of a dual exchange rate system. Again, one can raise questions about why and whether the two-step devaluation was necessary. But in the long run what mattered was the fact of the devaluation as a critical step in ensuring various kinds of back-up finance from the IMF and the World Bank. Again whether devaluation as such would lead to a greater value of exports (measured in foreign currency) was a secondary consideration. Devaluation, across-the-board deregulation and bringing down of tariff rates and easing of import quotas were needed to gain the confidence of the IMF, the transnational banks and non-resident Indian investors.

The confidence was gained at least to the extent of allowing the reserves to rise to a level of about $ 12 billion by the time the budget for 1994-95 was presented.[2] The fact that after remaining stagnant for a year and a half, exports rose by about 20 per cent in 1993-94 helped marginally in this process; a decline in international oil prices and stagnation in import-intensive industrial production also helped in bringing down the balance of payments deficit. But no significant addition to reserves took place through export expansion and import compression. Virtually all the addition to foreign exchange reserves accrued through new IMF loans, NRI deposits, and further commercial borrowing.

Growth of Some Incomes

During the process of structural adjustment started in June-July 1991, the record of industrial growth has been dismal. During the last year, even the agricultural sector has remained stagnant. All the so-called growth has taken place through the burgeoning of services, and it is not certain how real or how robust even that growth is. But what matters for the government's performance is not growth in the usual national accounting sense but the growth of incomes of the backers of the government. There is no doubt that traders, financiers, stockbrokers, and even entrepreneurs in sectors which were earlier stifled by government regulation (as, for example, in computer-related services), certain groups of exporters, foreign and Indian entities making a kill in the purchase of public sector shares or the assets of defunct public enterprises, and transnational corporations about to grab large chunks of industry and real estates in India have all benefited from the kind of growth the government has promoted.[3]

If we keep this in mind then we should not be surprised that the government has been able to flout some of the injunctions of the IMF canon and yet been able to retain the confidence of the Washington twins, and of the big Indian, NRI and foreign businessmen. The most important of these flouted injunctions, as mentioned already, is the promise to bring down the fiscal deficit. From the beginning of the current bout of SAP, it was clear that the IMF would accept a large degree of window-dressing as far as the letter of the instrument of understanding is concerned, because it would be a bad day for the IMF-World Bank image of vigilant watchdogs of global capitalism if India were to actually declare a moratorium on her foreign loans. As it happens, the limits for fiscal deficits were violated in the actual or revised budget figures for both 1992-93 and 1993-94, and resoundingly so for the latter year. The finance secretary of the government claimed bravely that these limits were flouted in the interest of growth. In that case what was all that hullabaloo about bringing back fiscal discipline into government finances and doing it mainly by slashing public capital expenditure and crippling the financial resources of the state governments? After all, the latter are responsible for most of the expenditures on the social sector, and public sector investment has been found to be a key element in promoting industrial growth in the past. In fact, much of the fiscal deficit, in spite of all these draconian measures imposed on the favourite whipping boys of the IMF and the central government, is due to excess expenditure for purposes of buying political support and shortfall in revenue realisation from direct taxes and from customs duties—both shortfalls belying the government's (and Chelliah Committee's) optimistic estimates of revenue elasticity of tax cuts. But these deficits certainly fed the 'growth of incomes'—of the key political support bases of the government. These bases include, apart from the sections of the population already mentioned, the rich farmer lobby. So the government may decide virtually to kill large segments of the domestic fertiliser industry by withdrawing their subsidies or budgetary support (and closing the bank finance route of survival for them). But it dare not make a big dent yet on the subsidies available to the farm sector and especially that part of it which has gained repeatedly from the raising of farm support prices above the equilibrium market prices or cost-based prices. The government also has tried to reassure the rich farmers that they will gain enormously as a result of the new GATT treaty and the permission to export any and all agricultural products.

In view of the stagnation in industrial growth, the government has from time to time reduced the interest rate (that is, the prime lending rate) from the very high levels to which they had been jacked up soon after it came to power. However, they are still much higher than rates of interest prevalent in developed market economies. It is a moot question as to whether a reduction in the rate of interest is a very effective instrument for stimulating domestic industrial growth, when all the other signals would induce caution and postponement of decisions on the part of all but the really big players who are confident of dominating their segment of the market. Apart from that, the government will have to keep a sufficiently large (open or covered) interest differential to continue to attract mobile international

funds and keep up a respectable volume of foreign exchange reserves. The government will also have to keep the rate of exchange stable within certain limits (apart from a one-step devaluation at rather long intervals, if the need arises). It has had to intervene in the foreign exchange rate in order to keep the rupee from depreciating (and in some cases also from appreciating) even though such depreciation might have helped international competitiveness in some export segments in this warfare of beggar-my-neighbour policies.

Role of Cheap Labour

How do the backers of the government then expect to make money with stiff interest rates and stagnant industrial production over all? There are several strategies, some of which may be operated in combination, open to them. One is to rely on the cheap labour costs in India. India must be now one of the lowest-wage countries in the world with a reasonably full complement of technical and managerial skills diffused among the population. Instead of trying to develop new industrial skills, the intending money-makers are going to draw on the accumulated balance, hoping that the exercise itself will generate new skills. The segments they will choose are those in which cheap skilled or semi-skilled labour will compensate for high capital costs. The strategy the government has followed of beating down the power of trade unions and creating a larger and larger reserve army of labour for potential entrepreneurs to draw from is very much linked with its perception that money can be made in India only in labour-intensive industries utilising skilled but low-wage labour—for example, textiles, leather goods or crude engineering products. That in a stagnant or slow-growing home market the producers of such goods will have to seek markets abroad is good news for the government's (and its patrons') objective of making the Indian economy fully open to the gales blowing from the ocean of international markets in goods and capital (but, of course, not labour).

If it is argued that there is not going to be much increase in employment in the organised sector in the near future, the reply will be that in the 1980s even with the 21st century fantasy programmes of the Rajiv Gandhi government, there was little growth in employment in the organised sector, except for the subsector under the control of state governments. What is likely under the new scenario is that while organised sector employment will decline, the informal sector will expand, both because there will be many more desperate subsistence seekers in the labour market (all the survivors of accelerated population growth of the 1960s are full adults now) and because there will be entrepreneurs (many of whom will be subcontractors of the export houses and transnational corporations) keen to exploit cheap labour and stake their fortunes on exports under the liberalised GATT regime. This last consideration along with the hopes held out to rich farmers is a major incentive for the government to sign the new GATT treaty. Of course, there were pressures for signing the agreement exerted by all the G-7 countries, and other major players, but if foreign pressure renders it politically feasible to pursue a policy which would have been sensible but not feasible without the pressure, then should such foreign pressures not be welcome? Was it not one of the arguments for getting India involved in an unsustainable foreign debt regime that such a politically unpalatable but economically sensible commitment could be extracted from her?[4]

Critics might argue that the new policy is pushing India back to the position of South Korea or Taiwan in the early 1960s without any of the advantages of the complete underwriting of South Korea's and Taiwan's balance of payments deficits and a privileged opening of the western markets to the exports from the then low-wage production platforms. The government might retort, 'What's wrong with such a scenario?' The opening up of textile markets under the GATT treaty will provide large enough markets for India in the near future, and the foreign exchange reserves combined with the new export earnings will provide the needed resources.

Aspects of Inflation

Critics might point out that the current levels of government deficits, the substitution of a truncated system of MODVAT or a rationalised system of excise duties and the successive increases in administered prices has already led to an acceleration of the rate of inflation. Now there are several aspects of the acceleration of price rises, and the government would be less concerned with some of them than with others. The first aspect is the impoverishment of the poor. In most periods of inflation at a high rate in our country, the poor, especially the agricultural labourers, are hit hardest since the price index of their consumption baskets goes up higher than the index for goods consumed mainly by the richer people. On the other hand, the agricultural or informal sector wages adjust only slowly to the rise in prices This development is unlikely to exercise the government too much. The fall in real wages in some areas may even be welcome to the entrepreneurs who hope to utilise an ever-cheapening labour force. The markets for the goods sought to be produced by them will be found abroad rather than at home—that is the calculation of the government—so the contraction of the home market is good rather than bad news. Of course, beyond a certain point, the managers of elections of the government may see the inflation as a danger signal, and then the government will have to do something about it.

The second aspect of inflation is the erosion of the international competitiveness of the country. Much of the current inflation is fuelled by rises in prices of crucial inputs produced mainly by the public sector, such as railway services, power, fuel and steel If the Indian rate of inflation as measured by the rise in prices of such critical inputs is higher than that of countries which produce goods that can compete with Indian exports, then the latter will also be affected in spite of the initial advantage of lower wages as measured by the relevant real exchange rate.

Thirdly, the erosion of India's international competitiveness may begin to erode the credibility of India trying to maintain a reasonably stable exchange rate, and that can trigger off a fresh capital flight. This danger can be stemmed by making a selective intervention in the market by importing goods whose prices are going up fast. The government, for example, decided recently to allow imports of cotton, sugar and edible oils in order to check their price rise (This, by the way, puts paid to the idea that India has an enormous range of exportable agricultural products and will benefit from the selective opening up of foreign markets required under the new GATT treaty) Such intervention is feasible if it does not have to be undertaken too frequently and if foreign exchange reserves remain at a high level It is these last two aspects of inflation rather than the continued impoverishment of the poor which is likely to be a headache for the government

Inequality Is Part of the Strategy

The above is a brief sketch of the kind of logic that underlies the actual decisions of the government, whatever other kinds of rhetoric it may use from time to time Of course, opponents of the policy will point not only to the enormously regressive or inegalitarian implications of the government's strategy As I argued earlier, engineering a further rise in the degree of inequality is part of the government's implicit strategy. It may also be argued

that the government is deliberately frittering away the resources of skill, technology and productive equipment built up over decades, especially in public sector units. The answer of the government might be that many of these units did not utilise those resources fully, they collaborated as happily with foreign enterprises as private enterprises, and many of them were used as milch cows by corrupt politicians and bureaucrats. The wastage of resources on those counts is no less than the resources that may be lost through the forced trimming of those enterprises. If it is said that the government is throttling the publicly funded R and D laboratories, its reply will be that (a) some of them are doing quite well under the new regime, and (b) under the old regime also their performance was pretty lacklustre, and repeated exhortation by many official committees failed to make them generate technologies which are either marketable or socially usable under Indian conditions. Yes, the government had its faults in not giving them adequate financial resources. Now those resources are even more exiguous. So let them sink or swim.

Finally, the critic may ask, what about all those other measures that can push up the rate of investment in the long run? Every purchase by a foreign transnational corporation of a chunk of India's real or industrial estate or by a money-dealer moving some funds with a view to making a kill in the stock market or in the market for firms hit by depression and financial stringency is hailed by the government and its media claque as the harbinger of a billowing foreign investment stream. But the rate of investment in the public sector is on a declining path and the private sector is busy trading rather than investing. The government's answer to the latter charge might be that the large-scale private firms, with a few exceptions, were always traders rather than serious industrialists. Maybe, the transnationals will do better in frontier technologies and acquiring a stake in a globalising Indian economy.

But there is no sizeable economy whose growth has been powered by foreign investment as such—direct or indirect. Capitalist growth has acquired a thorough overhauling of legal systems, land relations, a high rate of literacy, a tightening labour market and a minimum public provisioning for health and security of life. None of these are yet in evidence. The Hindu undivided family has escaped the scissors of the Chelliah Committee, landlords and their henchmen still rule most of the countryside and many of the small towns in Bihar, Uttar Pradesh, Madhya Pradesh, Rajasthan and Andhra Pradesh. Public provisioning for the poor has declined in real terms and is likely to decline further. There is no strategic planning for implanting industries or activities in which India could acquire a dynamic comparative advantage. So no East Asian miracle is likely to be re-enacted on Indian soil. But again, the question arises, will a strategy for vibrant capitalist growth as such deliver votes or money to the current backers of the government during the next six months or one year? How will the government absorb the impact of the unpalatable decisions on the managers of its votes, money and muscle power? Debating the government's budget will remain a purely technocratic or a moralistic exercise unless we raise and answer some of these questions. We perhaps need an ideological construction of sustainable capitalism with some semblance of human decency or socialism with the innovational vigour to survive in a world of disorganised capitalism.

Notes

1 The original models were developed by J M Fleming, 'Domestic Financial Policies under Fixed and under Floating Exchange Rates', *IMF Staff Papers*, Vol 9, November 1992, and R A Mundell, 'Capital Mobility and Stabilisation Policy under Fixed and Flexible Exchange Rates', *Canadian Journal of Economics and Political Science*, Vol 29, November 1963. For a convenient exposition, see P B Kenen, *The International Economy*, second edition, Prentice-Hall of India, 1989.

2 The data on foreign exchange reserves and export growth have been taken from the *Economic Survey 1993-94* of the ministry of finance, government of India. How much of the reserves could be drawn on in a crisis remains to be seen. The 1990-91 crisis faced by India was probably more due to a drying up of liquidity—partly because of a confidence crisis engineered by international (mainly US) credit rating agencies—than due to long-term bankruptcy of the country. For a detailed account of the build-up to the 1990-91 crisis, see Sudipto Mundle and Hiranya Mukhopadhyaya, *Recent Indian Experience in International Financing*, Working Paper No 10, National Institute of Public Finance and Policy, New Delhi, December 1993; and for an assessment of the liquidity and usability of different components of foreign exchange reserves see Sunanda Sen, 'BOP: Tread with Caution', *The Economic Times*, April 14, 1994.

3 As an indication of the kind of changes that are taking place in the earnings of different sections of the upper middle class and the rich in India, one can cite the salaries and perquisites being offered to management graduates or specialists in marketing and finance, as contrasted with scientists, engineers and graduates with degrees in humanities or social sciences (except for a very select few in journalism). It is also instructive to note that in 1992-93, a year of massive industrial recession, the majority of the top 300 companies listed by *The Economic Times* posted record profits. The latest profit figures released by Reliance Industries, a major player in the regulation-deregulation game, have also crossed all earlier records.

4 For a forecasting of the strategy to get India to be pre-committed to SAP, see A K Bagchi, 'Highjacking the Indian Economy', The *Herald Review* (Bangalore), May 5-11, 1985.

Gender Concerns in Macro-Economic Policy

Jayati Ghosh

While the impact of short term stabilisation measures are disquieting they can still be reversed The likely long term effects of liberalisation measures which move towards greater market orientation are more disturbing, not only because they affect women s material conditions immediately but because they set in motion longer term tendencies in the economy society and in ideology which are much more difficult to reverse

IT is now increasingly evident that the domain of macro economic policy is one that has critical significance not only for the women s movement but for all those who are striving for a more democratic free and egalitarian society The question that concerns me in this paper is how we as concerned citizens as well as women react to the set of macro economic policies that are officially projected as the move towards 'economic reform and how we view the possibilities for alternative measures which may be more in consonance with our own broader visions for social change and genuine progress

At the outset some points need to be emphasised I strongly believe that we would be committing a grave error and doing ourselves a disservice if we view the issue solely in terms of 'the impact on women or relegate women to the grey zone of weaker sections' eligible for safety nets from the charitable coffers of the state Rather it is necessary to consider the area of macro economic strategy afresh in terms of the entire impact on economy and society but with a perspective that is sensitive to women's needs and conditions Further it is time to move beyond the stage of simply reacting to official policies although this we must also *per force* continue to do given the relative power of the state and its ability to impose policies --to formulating and pressing for those alternative economic strategies which we see as imperative for productive restructuring of the economy and more desirable social distribution

As background, it is necessary to clarify what exactly we mean by various macro economic strategies, especially since there exists a great deal of confusion regarding terms, which is compounded by official presentations Government statements and media assessments tend to use several terms interchangeably, although they have very different meanings stabilisation, structural adjustment liberalisation and (most misleading of all) economic reform Essentially, stabilisation refers to the short-term attempt to stabilise' or steady the economy in the face of sudden shocks or existing macro economic imbalances especially in the balance of payments There are numerous ways to achieve this, depending on what the longer term aim of structural adjustment is The latter refers to medium-term or long term changes in the productive structure in accordance with overall social goals The way the term is currently used usually denotes the desire to make the economy more internationally competitive but this is not the only possible aim of structural adjustment it could as well be directed towards a more efficient and equitable provision of basic needs for the entire population or an attempt to improve labour productivity throughout all sectors in the economy without involving slack in the form of unemployment Indeed these aims are not always mutually compatible and it could be the case that the striving for enhanced external competitiveness actually reduces the economy s ability to provide basic needs and to improve aggregate productivity The concentration on international competitiveness alone is part of an overall approach which puts primacy on the unfettered functioning of markets as the best means of achieving growth and efficiency which is the essence of the liberalisation measures The latter are typically described in India today as elements of the economic reform package irrespective of whether they actually do involve a move towards improvement of the economic system in terms of the standard of living of the mass of people

I wish to argue that the package of measures being presented today as the economic reform package is neither 'the only option' open to the country, nor the set of policies most likely to result in a genuinely democratic economic and social system of the type which we would wish to see There do exist alternative strategies, both for the medium term and immediately which imply a different orientation as well as a different type of political will This has to be emphasised and the current macro economic policy package has to be demystified and shorn of the mistaken sense of inevitability This is important because we need not feel that we must simply work out how best to carve a niche for women given an unavoidable set of measures imposed by some hard economic rationale, since this is simply not the case This realisation in turn will allow us to create pressure for an alternative strategy to be put into action

The main elements of the current economic strategy, which attempts to combine stabilisation and structural adjustment under an overall umbrella of liberalisation and greater reliance on the market mechanism are as follows (1) reduction in the government fiscal deficit, which represents the excess of total expenditure over current income rather than the revenue deficit which is the excess of current expenditure over income (2) control over domestic credit expansion, in terms of restricting some measures of broad money supply, (3) devaluation of the currency followed by an exchange rate regime which allows the rupee to float determined by the market given full convertibility on trade account and now on current account in general (4) liberalisation of external trade with a move from quota controls on imports to tariffs and a gradual reduction of tariff barriers as well as removal of restrictions on exports particularly of agricultural goods (5) easing of conditions for foreign capital inflow especially direct foreign investment and portfolio investment by foreign agents in Indian securities, (6) domestic deregulation and freeing of controls including those on prices of essential commodities and restrictions on their movements (7) cuts in overt and covert subsidies essentially on exports, fertiliser and food both as part of the budgetary cut and in order to bring domestic prices in line with international prices (8) reform' of public sector enterprises usually implying a rise in output prices, reduction of state subsidies and possible closure of loss making enterprises and moves towards disinvestment and gradual privatisation (9) attempts to liberalise domestic financial markets, with a view to strengthening capital markets *vis a-vis* banking intermediaries, and allowing for various types of financial innovation Many of these policies have been only partially worked through as yet, while others, such as (10) 'reform' of the labour market, involving essentially the introduction of an exit policy to make firing and closure easier and doing away with such protective legislation for workers that is seen to make the labour market 'rigid' and 'inflexible', have yet to be officially introduced.

Reduction of the government deficit and monetary control are both measures designed to achieve stabilisation through a deflation of the economy, although we should note that so far the real budget imbalance which affects the net asset position of the government and involves the explosive ten-

dency of the public debt—the revenue deficit of the government—has not been corrected but has actually deteriorated This worsening of the revenue deficit has continued throughout the tenure of this government to the point when it has now reached historically high levels, despite the official claims of attempting to achieve internal public sector balance Devaluation and a 'floating' rupee which have been designed to keep the exchange rate at 'realistic' levels are part of both stabilisation and structural adjustment But it should be noted that despite some positive increase in exports, the achievement of some semblance of stability on the external front has been brought about mainly by further official borrowing and inflows of speculative capital in the form of portfolio investments in the Indian stock market Similarly the improvement in the trade balance reflects not only the increase in exports but also the precipitate decline in imports resulting from domestic industrial recession as well as the lower international price of oil Control over prices too has been largely related to the consecutive good monsoons which have ensured adequate agricultural output and underlying inflationary pressures still persist and are becoming more apparent Thus the stabilisation measures themselves are far from either complete or successful In turn the structural adjustment measures depend for their success on the crucial supply responses anticipated from the private sector which are so far nowhere in evidence as rates of investment stagnate there is a decline in the savings rate and no indication as yet of positive economic restructuring which actually generates more employment

All this indicates that the success of this strategy in its own terms is still by no means certain but even if we suppose (which appears increasingly unlikely) that it could bring about both stabilisation and a certain type of restructuring that integrates India more closely with the global economy there are implications that are disturbing not only for domestic distribution but also for the position of women It is useful to consider the implications for women in terms of the following variables access to basic needs, such as food clothing and shelter, and to the provisioning of common property resources, access to education and skill formation which would allow women to move out of low skill low-productivity jobs, access to the requirements for reproduction and nurture of the young, including not only health care and other social services but also child care, access to productive employment outside the home and recognition of household work, control over allocation of resources, both within households and socially

Each of these is negatively affected not only by the reduction in government expenditure that comes as a part of the stabilisation measures, but also by the general withdrawal of state from various aspects of provisioning of goods and services and the greater reliance on markets which are the desired form of restructuring of this government Thus, a cutback in public productive and infrastructural investment such as we have seen in the last four budgets presented by this government, affects not only growth prospects for the future but also production conditions and work situations in agriculture and the unorganised sector as well as in organised manufacturing and services Cuts in social infrastructural spending have even more direct effects on living and working conditions of women who continue to bear the primary responsibility for household health and nutrition as well as nurture of the young They can also affect women's ability to enter the labour market at all or may mean that forced entry because of poverty means an even greater double burden of domestic and outside work [In this context the feminisation of work that is sometimes noticed consequent upon such liberalising policies need not provide much cause for celebration, since they are often associated not only with exploitative work conditions and increased aggregate burden of women's work within and outside the household but also with declining levels of total family or household income as male members lose gainful employment]

There have been major declines in such important forms of public expenditure in real terms over the past four years The mistake is to see these as 'soft sectors' which governments may try to protect solely out of a magnanimous concern for welfare experience across the globe has led to the awareness that investment in health education and skill formation is absolutely crucial for future growth and a sound economy Similarly, expenditure on employment generation schemes have been vital in affecting employment and poverty conditions in the past decade and can go some way in explaining the much vaunted improvement in material conditions in the countryside over the 80s Declines in real investment in such schemes not only affect employment and incomes but also remove a potentially valuable way of providing more rural infrastructure

These implications of short term stabilisation measures are disquieting but they can still be reversed and sufficient pressure can be mounted to ensure that such expenditures are maintained and even increased However, the likely effects of the liberalisation measures which move towards greater market orientation are even more disturbing, not only because they affect women's material conditions immediately but because they set in motion longer term tendencies in the economy, in society and in ideology which are much more difficult to reverse It is often argued that these liberalisation measures are welcome because they will do away with the stifling bureaucratic control and excesses with which all of us are only too familiar But it is important to remember that the alternative which is effectively being posed to this is not the more open and democratic system we desire but a system in which markets operate to the benefit of large often multinational, capital Such a system is ultimately as centralised as controlled and as undemocratic as any that can be imposed by an officious and meddlesome bureaucracy Because it lacks any form of accountability it is also less likely to provide economic and social services and rights to those without political clout and financial power The fundamentally undemocratic nature of the current liberalisation measures is evident from some of the following facts While rules and regulations are constantly being eased for foreign capital for FERA and MRTP companies for large businesses generally and finance capital in all forms they are still as rigid and restrictive as ever for co operatives and genuinely democratic alternative organisations While the overt official assertions speak of the reduction of state intervention the actual functioning of the state is increasingly more centralised in economic terms The financial measures undertaken from the policies towards bank credit to the greater emphasis being given to capital markets militate against small enterprises The focus of labour market reform and the exit policy is on suppression of working class demands and giving greater freedom to fire labour rather than on managerial incompetence and entrepreneurial chicanery The point is that this type of liberalisation involves primarily greater freedom of action for large capital both financial and industrial both domestic and foreign— rather than a real liberation of the capabilities of working women and men

It also entails fundamental changes in the access of women to basic goods and services and affects their rights as workers and childbearers The main thrust of these liberalisation measures is not only the greater commoditisation of all aspects of everyday life and work but also a reduction of the subsidisation of activities not valued by the market and a preoccupation with enhancing profitability for exporters and foreign investors through the appropriate manipulation of labour The inequalising results of the operation of markets are seen as not only necessary but also beneficial in terms of achieving higher growth and greater international competitiveness The combination of the measures has several very specific effects which act upon the condition of women in particular The dominance of market processes undervalues everything which is not directly calculable in those terms, household work being a prime ex

ample At the same time such work itself becomes both more time consuming and more arduous when common property resources become privatised and carry financial costs because of the way commercialisation operates The reduction of subsidies to basic amenities such as energy sources sanitation and water supply and to basic services such as health not only reduces household income but also puts an especial burden on women who typically bear the responsibility for provisioning these within the household Reduction of food subsidies and of the scope and extent of the public distribution system puts pressure on food security of households a circumstance from which women are typically the greater losers Since the structural adjustment policies essentially involve a shift in income distribution away from wages many women may be forced to enter the labour market through sheer necessity of economic survival of the household even while the state and other social institutions abdicate the associated responsibilities of providing child care and easing the load of housework The recent experience of the east European countries shows how quickly institutions and facilities which allow women into the labour market with some degree of ease and equality can be eroded in the face of the dominance of market processes

In turn the access of women to creative and interesting jobs rather than simply paid drudgery which is necessary to earn a minimum income depends not only on education and skill building but also the sheer availability of such jobs in a diversified and growing economy An economy which is emphasising cheap unorganised labour as the main attraction for export oriented production or multinational investment is hardly likely to generate many such jobs At the same time this need for a free and flexible labour market would mean that much legislation that protects women workers (at least in the organised sector) such as reasonable maternity leave and benefits equal pay for equal work compensation for work related accidents and illnesses etc would be viewed as inimical to this particular growth path

A related fall out of this set of policies and the globalisation' that comes not only from the economy but also from the unprecedented and uncontrolled growth of the media in particular television is the ideological change that has a crucial impact on the situation of women in society The combination of consumerism and various religious fundamentalisms operates in a curious way to restrict female freedom and determine a set of material aspirations which reduce the space available for a genuine liberation of both sexes To my mind this is a serious and growing problem whose immediacy does not make it any less complex or any more susceptible to easy solutions It is nonetheless an issue of which we must be aware in any attempt to generate alternative strategies for the economy

Obviously, a mere critique of the present economic strategy, while undoubtedly necessary, cannot be enough We must also have a fair idea of what we propose instead, not simply as a way of reacting to existing policies and seeing how we can mitigate their effects, but really as part of our own vision of a just society Therefore I suggest that we look at the whole issue of macroeconomic strategy the other way around we should first define our own goals for long-term restructuring of the economy and adapt our medium term adjustment and short-term stabilisation measures accordingly so that they do not conflict with the long term goals I would argue that a genuinely democratic society is one where decision making is decentralised as far as possible where minimum basic needs in terms of goods and services are provided to the entire population through systematic and conscious involvement of an accountable government, where both women and men have access to education which in turn allows for creative and useful productive work as far as possible and where these essential goals are not compromised by external vulnerability in either economic or political terms It is perhaps a measure of our times that such relatively modest aims can be seen as utopian or unrealistic

The purpose of any structural adjustment strategy in my view should be to change the structure of incentives in the economy in such a way as to work towards these goals In the present economic context that implies several things firstly, a change in the incentives for the wealthier sections to encourage them to save and invest more domestically rather than to consume unproductively or to view the export of capital as a constant alternative, a shift in incentives designed not only to conserve scarce resources (including energy resources, land and water) but also to prevent the concentration of their ownership and control, a change in incentives to encourage greater self sufficiency in crucial areas such as food security, a greater emphasis on improving productivity in the economy as a whole and in all sectors rather than in a few chosen sectors, an emphasis on efficient and effective utilisation of our greatest resource—labour—rather than allowing the tremendous waste and inefficiency of unemployment and a degree of protection from the more inequalising and destabilising effects of the operations of global markets The focus of the adjustment strategy should therefore be to work out the means—in terms of fiscal and monetary strategy, guiding investment allocations, price signals, etc—that will change the structure of incentives in this manner In all this, a major emphasis on decentralisation of economic decision-making of the state apparatus is absolutely crucial, not only to make for more democratic accountability, but also for better and more efficient use of resources

Such aims in turn mean that the short-term and medium-term strategies should not be such as to expose us more directly to the uncertain vagaries and whims of international capital but should instead seek to achieve genuine stabilisation through internal efforts It is worth recalling that the trade balance was brought under control in 1991-92 essentially by sweeping import controls rather than exchange rate changes and that true internal balance in terms of a control of the revenue deficit has still not been achieved Internal and external balance today require fairly harsh measures, but it is possible to devise measures that are harsher on the richer groups than on the poor (such as increased direct taxation and cutting down on wasteful government expenditure on the fiscal front, and import controls on intermediates for luxury production) and simultaneously more effective Further it is important to ensure a stable and high rate of export growth not only to bring the external accounts into sustained balance but also to protect the economy from the threat of capital flight or the dependence on capital inflow—but such export growth requires strategic state intervention rather than reliance on the market alone Such policies require an entirely different political motivation as well as a different approach to external dependence Lest it be argued that such policies are politicaly unfeasible I should remind you that government policies can be altered by sufficient pressure and perhaps it is our job to create the awareness that can build up such pressure

All this is a matter of some urgency because of the rapidity of the economic policy changes and their possibly far reaching implications This is a particularly challenging time for the women's movement, for two chief reasons One is the ideological threat of religious fundamentalism and other forms of patriarchal doctrine which have begun to threaten even the few carefully won freedoms for women in our society And the other is the tendency to integrate the Indian economy closely into a global set of inequalising market structures which may set into train processes that are difficult to reverse because they alter the rules of the game in significant ways I have argued that many of these processes will operate to worsen the material conditions of women workers in the immediate sense, and will affect the future ability to improve conditions as well The need to confront these threats must be the central issues on our agenda

[This is a slightly revised version of the Key note Address to the Sixth Annual Conference of the Indian Association of Women's Studies, Mysore, May 1993]

Gender, Environment and Structural Adjustment

Kumud Sharma

The effects of fiscal and monetary policies on women is determined by the social matrix and gendered patterns of resource use and control in rural households. The concept of 'environmental justice' cannot be delinked from issues of equity and social justice.

ENVIRONMENT and 'sustainable development' are firmly on the global agenda. The debates during pre and post UNCED Process (The UN Conference on Environment and Development at Rio, 1992) have shown that not only these are political issues involving various contending nations and interest groups but the results have been disappointing. Despite unanimous acceptance of the Rio Declaration, in the words of Maurice Strong the secretary general of the conference, "we got an agreement without commitment". The UNCED marked the culmination of two decades of debates on environmental issue.

Environmentalism today has many strands of logic and ideological perspectives. However all of them offer a powerful critique of the dominant paradigm of growth, development, free market globalisation of economy, etc. The Brundtland Commission's Report (WCED), 1987 and later the Rio Declaration (1992) popularised the concept of 'sustainable development'. Various definitions of sustainability, however skirt central issues of equity, justice and respect for diversity and plurality. The concept of "*sustainable development does not challenge the instruments in the hands of those who have power*. It only begs those who use these instruments to be more careful in using them so as not to destroy our ecological system" [Nypels 1993]. The World Commission on Environment and Development [WCED 1987] acknowledges that achieving 'sustainability' implies a radical transformation in present-day economies and in the ways natural resources are owned, controlled and mobilised. It also notes that "the pursuit of sustainable development requires a political system that secures effective participation of people in decision-making by decentralising the management of resources upon which local communities depend." In the final analysis the changes towards a just and equitable society have to take place at the community level. The NGO Declaration at Rio clearly states "We strongly refuse to allow the concept of 'sustainable development' to be simply turned into an 'economic notion', restricted to new technologies and subordinated to the latest market products. To allow this would be to perpetuate 'structural poverty' and wealth that arise from the dominant model of civilisation we have denounced. The problems, however, run deeper than the questions raised by protagonists of 'sustainable development'.

The Tribunal of Miami World Women's Congress for a Healthy Planet (November 1991) adopted three guiding principles for its deliberation: (a) Global equity, (b) Resource ethics, (c) Empowerment of women. The dominant world order based on exploitation of resources, accumulation and inequities, negates these very principles. It marginalises diverse life-styles, living forms, and cultural groups (tribals and indigenous people) not compatible with its demands and pressures. The WCED states that "their marginalisation is a symptom of a style of development that tends to neglect both human and environmental considerations".

The homogenising thrust of the process of growth and development with its unidimensional meaning of 'development' has played a central role in destroying diverse yet unique people's responses to diverse eco-systems. Brundtland Commission argued for a 'new era of growth' "to meet the needs and aspirations of the present generation without compromising the ability to meet the needs of the future generation". What does the 'new era of growth' promise to people whose diverse subsistence needs for natural resources are seriously threatened? Whose needs and aspirations get projected through various negotiating mechanisms? Who are excluded and who are included? During the chequered history of humanity's progress from the 'growth era' to 'sustainable development', many of us lost touch with the grass roots realities of millions of women and men struggling to protect their life support systems and livelihoods.

Global perspectives and ideologies inherent in concepts such as 'global commons', 'global strategies' for management of natural resources, 'global economy', etc, ignore unequal power relations and social and cultural diversities. At what level can one integrate the concerns and realities of the lives of those for whom our new lexicon remains alien? Where and at what level do the concepts of equity and social justice become operative and relevant? Caught between Earth's finite resources argument and advocates of 'new era of growth', many ideas which belong to oppositional domains become part of the global perspectives, debates and strategies.

The Human Development Report argues:

> In a global system marked with widening income disparities, economic growth disparities, human capital disparities (life expectancy, nutrition, infant and child mortality, adult literacy, enrolment ratio, etc) disparities in the distribution of global economic resources and opportunities, the disturbing question as to who will protect the interest of the poor and the under privileged sections remains unanswered in the corridors of power. The dominance of rich nations, multinational corporations and international capital over the markets, resources and labour in developing countries through trade, aid and technology transfer has greatly weakened the capacity of nation states and governments to promote human development and offer protection to the poor people. The existing framework of global governance is weak, *ad hoc* and unpredictable. If global opportunities continue to be unevenly distributed, the consequences of the most pressing problem, poverty, will increasingly overflow national frontiers [UNDP 1992].

The iniquitous world order poses a serious challenge to the claims of human development and basic rights which are threatened by the destruction of many third world economies under pressure of international debt and structural adjustment. The decade of the 80s aptly described as 'the decade of global impoverishment' witnessed some real set backs in terms of investment on social development sectors and human priority concerns. The last decade was marked with debt crisis, resource squeeze, structural changes, mass hunger and environmental crisis in many parts of the developing world. The total external debt of developing countries increased from \$ 100 billion in 1970 to \$ 650 billion in 1980 and \$ 1,300 billion in 1990. Between 1970 and 1990, the richest 20 per cent of the world's population increased their incomes from 30 to 60 times more than the poorest 20 per cent. Does the answer lie in free global markets or massive investment in people with a fundamental change in institutions of 'civil society'? [UNDP 1992]

Payer in her book explains that the present third world debt crisis is the direct result of the ideology which insists that poor countries need large and sustained inflows of foreign capital for their development. She also argues that the belief that debt crisis was caused by the OPEC price hike is a myth. In fact the crisis was a direct result of aid policy followed by western powers in the post second world war period. She stresses that the international flows of fund must be subjected to stringent controls of a strictly non political nature if the disaster of the 1980s is to be avoided [C Payer 1991].

In the early 1980s the debt crisis was officially acknowledged. Today global debt management has entered a new phase as Asian countries are subjected to various structural adjustment programmes. In India the economic policy package has led to expressions of alarm as to what the costs will be - political, socio cultural and ecological. The macro economic strategies (global and national) are affecting both people and the environment.

Economics of Materialism

The Brundtland Commission recognised 'economic growth' as an important factor in the destruction of natural resources and environment. However it argued for a 'new era of growth' to counteract the adverse effects of economic development. It stated that "If large parts of the developing world are to avert economic, social and environmental catastrophies, it is essential that global economic growth be revitalised. This means more rapid economic growth in both industrial and developing countries, free market access for the products of developing countries, lower interest rates, greater technology transfer and significantly larger capital flows, both concessional and commercial" [WCED 1987]. The UNCED 1992 process never went beyond this argument and opted for more economic growth. Maurice Strong, the secretary general of the UNCED declared that "the environment is not going to be saved by environmentalists. Environmentalists do not hold the levers of economic power".

Resource use systems are strongly influenced by market forces and government policies as well as structural factors. Environmental degradation in the south is strongly related to the global process of trade and economic relations. The *World Development Report* states that one of the most valuable lesson relates to the interaction between the state and the market in fostering development. "Experience shows that success in promoting economic growth and poverty reduction is most likely when governments compliment market, dramatic failures result when they 'conflict'". The report describes a 'market-friendly approach' where government intervenes only in those areas in which markets prove inadequate [World Bank 1992].

The history of market economy is one of struggle over resources and excesses of an uncontrolled private interest and greed. It is the life styles and consumption patterns of the world's elites which have created environmental problems. Macro- economic and political processes have transformed people's own 'social safety' nets based on sustainable use of local resources and have made them vulnerable to the market forces. Sen has reflected on the partial dismantling of the food security system with the introduction of market oriented reforms after 1979 [Sen 1981]. The trend of displacement of domestic foodgrains production by export crops for international market or the globalisation of Indian agriculture is what Patnaik calls 'recolonisation of Indian agriculture'. The government has now embarked on a policy which will gradually liberalise agro exports.

Patnaik argues that "the contradictions in the Fund Bank formula can be resolved only when it is realised that there is a dual agenda involved. Apart from the explicit agenda of stabilisation and adjustment there is an implicit agenda of cheapening imports from third world for western consumers and opening up their economies to unrestricted operation of international capital. Pressure for devaluation deteriorates developing countries trade balance and hence cuts in public expenditure" (1992).

She points out that "historically the area rich in 'biodiversity' in the tropical and sub tropical regions including India have contributed to a more diversified consumption basket of the population in these regions than was the case with the population in western Europe four centuries ago. During the last two centuries the living standards of the average west Europeans and north Americans have been transformed owing to their increasing dependence on imports from the bio-diverse tropical world. If north south trade were to cease these living standards will collapse. A large number of food and non-food items constituted the imported commodities of tropical and semi-tropical regions. By 1980s in a colonising country like Britain, primary sector imports constituted over 60 per cent of its own primary sector production" [Patnaik 1992].

Regarding food items alone it has been estimated that an average western supermarket carries some 12,000 varieties of raw and processed food items of which at least two thirds have a wholly or partly tropical or semi tropical import component. The producers of some of these exportables to the north are the poorest people in the world getting rock-bottom prices which have shown a sharp decline during 1980s [Friedman 1990].

The consumer demand in advanced countries acts as a powerful stimulus in altering cropping pattern in less developed countries. TNCs engaged in agribusiness, through their capital and technology play a major role in acquiring access to resources and markets in developing countries. Acquiring control over the plant and bio-diversity through research and patenting constitutes a major thrust of Dunkel proposals.

The Dunkel proposals regarding trade and fiscal measures and intellectual property rights (IPRs) include reduction in agricultural subsidy, converting all barriers on agricultural imports into tariffs, guaranteed minimum access for farm imports of between 3-5 per cent of consumption, reduced Public Distribution System (PDS) activity and subsidised food to only poor sections, phasing out of multi fibre agreement (MFA), etc.

Recent violent agitation by the Karnataka Rajya Raitha Sangha against the seed processing US multinational subsidiary Cargill Seeds India has to be viewed in the context of the Indian government veering towards accepting Dunkel Draft. Patent legislation will enable them to control the price and distribution of the varieties that they produce in the same way in which multinational pharmaceutical company monopolise the sale of drugs and determine the price.

Another US company has patented the biopesticidal properties of the 'neem' seed and has sold it to Grace and Company which is setting up a plant in Karnataka in collaboration with Margo. The plant will initially process 20 tonnes of seed per day for export to US. Patenting turns common natural and intellectual resources of Indian people into private property. Hybridisation of 'neem' seeds will lead to the gradual disappearance of the original 'neem' seed that village men and women use. Such piracy of the common intellectual property by TNCs leading to possible plant genetic erosion is being given legal sanction by the GATT agreement on Trade Related Intellectual Property Rights (TRIP).

TNCs engaged in agri-business and food processing industries have tried to acquire control over tropical biodiversity and the rise in exportables has meant a fall in the per head production of basic foodgrains. The government has identified agro exports among the priority areas along with export of minerals (iron ore), marine products and import substitution in edible oil and natural rubber.

Another example that can be cited is of the impoverished small farmers of Gujarat with minimal irrigation and fertilisers, producing psyllium (Isabgol) for MNCs (80 per cent of the 10,000 tonnes of crop is exported

annually) in about 50,000 hectares of land. The average farmer earns a miserable Rs 1,250 per annum per family. The processors on the other hand are earning increasing profits as the demand for the product is going up in international health food market (*The Statesman*, September 11, 1993).

An Indian environmentalist articulates his concern about the likely implications of the current liberalisation programme and decontrol of trade and industry on natural resources. 'Indian industry is powerless to draw from the global economy, and it will turn to increase the pressure on the country's own ecological base. With the thrust on exports the result would be an increasing pressure on biomass-based industries. Pressure on minerals, power and water will also increase' [Agarwal and Narain 1989].

Institutional and policy mechanisms which take care of environmental costs and benefits into account in the decision-making process are weak. The country desperately looking for foreign investment may not have much choice when dirty or highly polluting industries are relocated.

Industrialisation continues to provide a strong argument for development and economic growth. With the emergence of business conglomerates and entry of MNCs the national boundaries have retained their political significance but have become increasingly permeable by MNCs. In this international division of labour countries in the west are becoming the locus of technological expertise and financial control. The government's incentives to lure international capital to tide over balance of payment situation has not been without pain. There is clear evidence from south east Asia and Free Trade Zones and Export Processing Zones in south Asia that such export oriented manufacturing units in developing countries rely heavily on female skilled and semi skilled labour as a source of cheap labour. In a situation where a large informal sector exists in both urban and rural areas, the distributional concerns being articulated by the women's movement, are important as poor women will be hard hit by changes in employment and labour status, changes in prices of food and basic services, reduced household income, rising cost of public services and entrepreneurial activities. The situation of women in the informal sector is going to worsen.

Sen, a philosopher economist who has addressed issues on ethics and economics in his work on inequality, poverty, famine and entitlements for women and the poor, points out that the market simply does not take into account real costs to society through environmental degradation. There are failures also in dealing with social deprivations of the kind we see in many cities. Solutions to these problems cannot be found through reliance on the market alone. What is needed is an expression of public health care, social insurance and more extensive public education. He argues for removing irrational controls, creatively using market mechanism and more rather than less state intervention and action in these areas (*The Times of India*, July 9, 1993). However, the resource conversion is often state mediated. The logic of the market does not take into account women's contribution as producer and reproducer of life and livelihood.

I
Gender, Environment and Development

Issues of gender equity and justice assume added significance in the context of interface between new economic policy prescriptions and gender relations. The distributional concerns are crucial to our understanding of why women are hit harder than men by environmental degradation. These can be partly offset by targeting direct assistance to the basic needs of women (public distribution system for foodgrains, provision of drinking water, fuel and fodder, health care and education).

In a predominantly agrarian economy like India a sustained increase in agricultural production cannot be achieved by unsustainable resource use. Peasant farming systems of which women are an integral part combine elements of traditional farming systems with new technologies. Locally-based resource management system are under increasing pressure in the face of mounting competition for natural resources. Through aid, trade and technology transfer control over resources (forestry, fishery, water, bio-mass, etc) has shifted from local to national and international agencies. At times the tribals and peasant communities get pitted against international institutions with the state acting as an agent for dispossession of local communities. The concept of economics and politics defined within the market framework is being challenged by third world ecology movements. The 'right to life and livelihood' is a wider concept of economy and is linked to issues of resource ethics and equity and justice. However, the issues of ethics and equity somehow got separated from the new 'environmentalism' emerging out of Rio [McCoy and McGully 1992].

The natural resource base is closely linked to the livelihood and well being of the poor rural households. Shiva argues that "economy and ecology are not opposed but converge in the survival economies of the third world poor however, in the context of market-oriented development they have been rendered contradictory" [Shiva 1991]. The logic of intensive agriculture, extractive economies and resource-intensive technologies, has undermined the natural resource base. The subsistence economy is coming under increasing pressure from the market-led forces. Most of the discussions on economic policies do not link economic issues organically with political, cultural and environmental issues. Both market and state build on and manipulate existing gender and social relations. However gender-neutral policies with their underlying patriarchal ideology and structures continue to marginalise women's contribution behind fuzzy definitions, faulty theories and half-hearted attempts at programme planning.

In gender-neutral policies there is always a danger of women's subsistence and self-provisioning roles being neglected. The impact of environmental degradation on women's livelihoods, workload (collection of fuel, fodder, water and minor forest produce), health, nutrition and fertility decisions, has been increasingly commented upon. Review of literature on the interconnections between gender, environment and macro-development processes suggests that the debates in the south are mainly located in the gender poverty argument. The explanatory variables include sexual division of labour, feminisation of poverty and gender ideology. What are the implications of this linkage *vis a vis* policy interventions aimed at commercialisation of natural resources depriving people of their entitlements?

The 'women as victim' argument dwells on the differences between women and men's knowledge, responsibilities and control over resources and how they are differently affected by environmental decline. An UNRISD/UNFPA study on the 'Social Impact of Environmental Degradation at the Community Level' explores three hypotheses:

(1) The local system of resource use are engendered and the male and female resource related livelihood systems are differentially affected.
(2) The burden falls disproportionately on women because of their nurturing function. It is much easier for men than women to generate income in other sphere of economic activities.
(3) Women's work obligations are not matched by a corresponding control over resources which would enable them to take the best trade off decisions in circumstances of environmental decline. This reflects women's disadvantages in other dimensions of livelihood (market related) in which environmental resource entitlements are embedded [UNRISD 1992].

This viewpoint ignores the contribution of women to maintaining bio diversity, sustainable agro forestry systems, water management and innovative management of community resources.

Those who see the links between poverty, decline in common resources and livelihood and women's grass roots initiatives in protecting and regenerating their community resources base, argue that women are not

only 'first victims' of environmental decline but also 'saviours' and conservationists.

The eco feminists view women as being closer to nature and having a natural predilection for conservation of natural resources. The discourse on eco feminism not only articulates important connections between the domination of women and exploitation of nature but also argues that the feminist and the environmental movements are both non hierarchical and can reconceptualise an egalitarian perspective which is more in harmony with nature. While women's movement and ecology movements both critiqued development theorists and practitioners, the understanding of diverse problems of various eco systems threatened by human and policy interventions reflect a great deal of diversity to be amenable to simplistic analysis. Agarwal suggests that 'feminist environmentalism' is rooted in their material reality. In this conceptualisation the link between women and the environment can be seen as structured by a given gender and class (caste/race) organisation of production, reproduction and distribution [Agarwal 1992]. Mazumdar argues that there seems to be a general reluctance on the part of scholars, policy makers and environmentalists to define the class and characteristics of women who ought to be projected as key actors in the environmental debate, i e, peasant women [Mazumdar forthcoming]. Distinguishing between the social base of the environmental movement and its articulate leadership or the 'public' and the 'private' face of Indian environmentalism, Guha argues that a large segment of what presently passes for the environmental movement is a peasant movement [Guha 1988].

The potential of peasant and tribal women in mobilising for environmental action has been emphasised by many action groups. They are viewed as 'day-to-day environmental managers' [Dankelman and Davidson 1988] or as 'barefoot conservationists' [Davidson 1989]. This instrumentalist view is however questioned by Sen and Grown: 'It should be remembered that they are neither responsible for the crisis in the world system nor can they be expected to resolve it.' This makes sound sense. However, it is the resource impoverished women who have intervened in decisions that threaten their environment and livelihood.

The symposium on 'Women and Child First' argued for a reversal of presumptions in the debate on 'gender, environment and development' and emphasised that the UNCED Conference at Rio should focus on resource users (human beings) rather than resource alone. The tendency to keep environment in a 'policy ghetto' however, strengthens the arguments for 'protecting the environment'. It is to be protected from whom? This argument also delinks human development from human environment. To emphasise the vital linkages between human progress and environment we need new indices to take into account the earth's resources and the human costs of ecological degradation.

We also need to look at the contribution of unpaid work of women and children and their struggle for survival in an environment under distress. The symposium highlighted the issues of land reform and peasant women's access to productive resource to ensure food security and sustainable livelihood systems [UNICEF 1991]. A study examining the linkage and interaction between land tenure and deforestation, defines land tenure in terms of a 'bundle of rights' and obligations governing the use and control of land and water resources. The land ownership patterns which contribute to insecurity of tenure and rural poverty often contribute to environmental degradation. Peasants and forest dependent communities are frequently dispossessed by traders and settlers, who lack both knowledge and incentives to use forests in a sustainable manner. Such arrangements are often backed by political/economic structures and government policies [Dorner and Thiesenhusen 1992].

Underlying these debates in national and international fora are many hidden questions and a set of assumptions. In global debates have we overemphasised the interconnectedness of 'our common future' without adequately addressing the power dimension both between and within nations, and the normative issues?

The fear in developing countries is that environmental issues could be used in an interventionist manner by various government and aid agencies. In many developing countries governments are quick to adopt liberal agenda and emancipatory rhetoric. An analysis of 'Chipko' movement—hailed for women's activism—states, that "the state has used growing environmental concerns to concentrate on environmental management without any concern for devolution of environmental rights and obligation. Chipko began independently of global environmental consciousness, but in interacting with the rest of the world, it assumed a deep conservationist bearing. In the process its utilitarian and developmental stance was steadily eroded. The forest that women tried to protect has been converted into Nanda Devi biosphere reserve and women cannot even take a blade of grass or even pick a herb to treat a stomach ache"

Population Question

An important dimension of the internationalisation of environmental concern is the population question. The issues of resource ethics, militarism and debt management are pushed to the background while population is seen as a real threat to environment. The argument generally is: Fight the menace of population for removal of poverty. Population control is one of the four priority areas of India's Eighth Five-Year Plan. Recently the government of India has set up an Expert Group to draft a National Policy on Population. Maurice King's famous write-up on 'Human Entrapment in India' accused UNICEF with its ORT and immunisation policies for child survival, of compounding the population problem. Over-population, poverty, under-development and environmental distress argument has been popularised by various thinkers in international agencies.

An alarming extension of the demographic argument can be seen in population control policies and new technologies (anti fertility vaccines, Norplant, Net-N, etc). Mazumdar argues that the general preparations for the UN Conference on Environment and Development at Rio, appeared to focus more on "examining the relationship between poverty and environmental degradation which tends to strengthen the widely prevalent view among the haves of the world that the poor are mainly responsible for the present environmental decline. Stretched to its global logic, this view also incorporates a similar charge against the poor but populous countries of the world. The view that associates women mainly with reproduction sees women as a real population threat" (forthcoming). The population hysteria has now gripped both international and national agencies. Anti-natalist policies and the population, environment and development debate dominated by the perspectives of industrialised countries, have provided a strong rationale for research and investment in reproductive technologies.

A statement issued by some of the Delhi based organisations rejects the argument that population growth is mainly responsible for poverty and environmental degradation. It points out that population growth is a direct consequence of increasing inequities and dispossession of the majority. The government seeks to address the symptoms of population rise without addressing the economic and social structures and policies which are the root cause (Delhi statement by women's organisation calling a halt to anti-fertility vaccines, 1993).

Environmental degradation is not a demographic question. Josue' de Castro's masterpiece, *The Geopolitics of Hunger* (revised and expanded in 1973) reflects on the experience of decolonisation and development in the post-second world war era. The book explores two related theses. The first focuses on the social roots of hunger which can be traced back to the direct or indirect effects of the system of colonial exploitation. The second theses which he considers the 'crucial point' of his book challenges the Malthusian notion that demographic pressure on subsistence level is responsible for hunger and underdevelopment. He claims that starvation is the cause of over-population.

The global perspectives on environment have on overriding concerns with population growth in developing countries. NGOs in developing countries have offered a powerful critique of resource use patterns in the developed countries focusing on equity in distribution of resources, protection of resource base and ensuring livelihood of people. Large populations and poor people are blamed for environmental destruction. At the same time, timber lobbies, big projects to supply infrastructure to the export industry (large dams, land to MNCs), mining and quarrying activities which pose a great threat to environment. They treat environment as an externality instead of a living system that affects people's lives. The prescriptions often put wrong emphasis on people who have been victims of interventions as a consequence of decisions made in the centres of power.

The Committee on Women, Population and Environment (a global alliance of women activists, environmentalist, community organisers, health activists, etc) challenges the widely promoted view that population growth is the primary cause of "global environmental degradation and population control the solution". Such a view not only helps to lay the groundwork for an intensification of top-down population control programme that are disrespectful to women, but ignores the major causes of the environmental crisis, i e, military and industrial toxic wastes and the over-consumption of the affluent nations.

Population policies were on the agenda at the Earth Summit 1992 in Rio, where the charge of over-consumption in the north was counteracted by blaming the population pressures in the south as the main cause of environmental degradation. In the context of the emerging debate on the links between population and environmental degradation three groups (DAWN, ISSC and SSRC) argue that "extremes of wealth and poverty leading to over-consumption of some and erosion of livelihoods for others skewed distribution and use of resources and patterns of human settlement (including urbanisation) have a stronger demonstrable relationship to environmental degradation than population size *per se*. They ask for critical assessment of environmental and human effects of intensive agriculture, transformative industries and military activities that produce waste and pollution and reassessment of macro-economic forces such as debt, SAP, financial trade flows and agreements and national government interventions [Social Science Research Council 1992].

Is there a contradiction between subsistence and sustainability? The inherent blindness of the present paradigm of development to human dimensions are highlighted by social movements, women's movements, ecology movements, peace movements, indigenous people's movements, and human rights movement. People's initiatives to ensure greater accountability of systems of governance and public institutions have assumed a greater significance today, however they continue to be weak.

II
From Global to Local: Women as Organisers of Grass Roots Action

In the last two decades, conflicts over the alternative use of local resources—wasteland development and conflict over commons, river waters, marine resources, minor forest product, etc—have given rise to several community initiatives. A variety of institutional patterns have emerged in such community-based natural resource management systems.

Despite ideological diversity of community initiatives and proliferation of NGOs working in the area of environmental action, poor peasant women are motivated for group action as they regard these organisations as the only protection against their vulnerabilities as individuals at home, at work and in society. Collective control and management of productive assets (land, plantations, village forests, watersheds) increases women's bargaining power and could lead to changes in local production relations as well as power relations. In one of the action project areas in Bankura district of West Bengal, women have mobilised around wasteland development (with CWDS facilitation). Once the district had thick mixed forests, Santhal tribals lost their forest and land to traders, contractors and cultivators. They started migrating for work to Burdwan and Hooghly. The migration was harsh and women clamoured for work in their villages. The project has evolved from women's group activity of reclaiming wasteland and converting them into tassar plantations. One of the Samiti members emphasised: "We have learnt that actually it is the land that owns people. We have worked hard to give it a green cover and in return it has clothed us with authority. We are advancing together. The journey has just begun" [ILO 1988].

The question is—can such interventions at a micro-level snowball into a process of change towards greater empowerment of women and can it deal with macro-economic processes which negate such gains. Can the government play a supportive role?

Does the local power structure allow space for women together to reshape their lives? For this to happen Ela Bhatt points out that "a restructuring and reordering of power structure is necessary and it should take place at the local level... The lesson is decentralisation of decision-making and management of resources, local planning based on local needs, skills, resources and local implementation" [Bhatt 1992].

Nationalisation and privatisation of common resources have often led to environmental degradation. Greater security of tenure for local resource users, respect for customary rights and giving a stake to the local community in managing resources is a prerequisite for ensuring environmental rehabilitation and livelihoods. Agarwal and Narain emphasise that "to achieve environmental security each rural settlement of India must have its own clearly defined environment to protect, improve, care and use" [Agarwal and Narain 1989].

The social ecological movements have clearly demonstrated their opposition to models of development which deprived the local population of its livelihood base. Economic decision-making processes have yet to revise their concepts to include the value attributed to the environment by people whose incomes and livelihoods are affected by policy interventions. The survival strategies of poor women are really not incompatible with practices of environmental conservation.

Peasant women, historically, have been the resource managers although this has received scant attention in environmental debate. A National Conference on 'Management and Regeneration of Natural Resources: A Wider Role for Peasant Women' organised by the Centre for Women's Development Studies in collaboration with NIRD, Hyderabad provided grass roots organisations of peasant women an opportunity to not only share their views, experiences and perspectives; their struggles and aspirations but also to grasp the national and international dimensions of some of the critical issues. The four peasant women's conferences organised in India, Bangladesh, Nepal and Pakistan (1991-92) followed by a south Asian Regional Conference at Lahore clearly brought out peasant women's common concerns and their dependence on natural resources and particularly common property resources. In the Indian Conference, 89 peasant women representing 29 grass roots groups from different parts of the country identified the core issues affecting their livelihood as land degradation, poor maintenance of land records, deforestation, problem of water resource management, interrelationship between environmental and social change, nature and role of collective action in strengthening women's voices in local decision-making processes and need to recover, expand and redefine women's traditional rights with greater security of tenure for resource use [CWDS 1983].

They protested against land degradation caused by siltation of rivers and reservoirs, mining, indiscriminate felling of trees, decline of common resources and indiscriminate use of fertiliser and pesticides.

> Now that we are restoring some of these wasteland through planting trees, we want to tell the government that chemical fertilisers and pesticides do a lot of harm to land, cattles and human beings. We can suggest methods to produce more of green manure which our ancestors used. That will also prevent pollu-

tion of water (Sarla, president of Nari Bikash Sangha, Bankura, West Bengal).

Most of the peasant women complained of loss of village commons through privatisation and encroachment:

> Our 'gomal' (common) lands even our village tanks are not safe from the greed of the well-to-do. They have conspired with Panchayats (local village councils) and the government officials and converted these into private farms or houses. Our mahila sanghas (women's organisations) do not have access to these common lands or we would develop them for use by everyone in the village. Women need fuel and fodder—the common lands should be under the management of the sanghas and not owned for private profit by industry or farmers (Gangamma, a peasant woman from Karnataka).

The biggest problem that the state policies have created in the village communities is their alienation from their commons. Studies have shown that access to village commons reduces income inequalities—between poor and non-poor households. Degradation and encroachment of village commons and declining community control and usufruct rights due to erosion of community resource management systems have affected poorer households' capacity to meet subsistence needs. The dependence of such households is greater in arid and semi-arid areas and the coping strategies of poor households are linked to seasonality, crop cycle and variations in food availability.

Joint forest management (JFM) a new concept which is currently being tried in 14 states of India aims to drastically revise the old policing role of the forest department and puts forest dependent communities at the centre of the new policy. How has this partnership between the forest department and forest-dependent communities worked? A workshop report on JFM indicates that most effective local institutions develop in those communities which are small and homogeneous the topography of the upland villages being such that their common lands are visible (hill and upland villages). Once degradation sets in, people become indifferent to protection. Remoteness from roads and markets further helps in retaining mutual obligations. Fear of village elders deters too frequent an abuse of common resources. Finally such collaboration is likely to succeed if all families including the rich are highly dependent on forests for fuel and fodder. The report further states that village stratification in India inhibits development of institutions representing a common will. Grossly unequal land tenure and access to markets ensure that only a powerful minority gains in the name of the 'community benefit sharing'. An effective forum for conflict resolutions is crucial to the success of the community involvement. The states, where there is an organised political pressure from below and direction from above, have often responded well to such challenges. Interestingly, the workshop report dwelt on the paradox of the nature of state power in India where people-oriented policies tend to legitimise state power. While land degradation and deforestation weaken the state, land rehabilitation and anti-poverty programmes make people dependent on state authority. The report also advocated separate organisations of women as the village social system marginalises them [SPWD 1992].

Shramashakti, the report of the National Commission of Self-Employed Women and Women in the Informal Sector (1989) clearly argues for governmental support to organisations of poor women:

> When the state is sympathetic to the issues of poor women and supportive of their organising efforts, women do gain as the governments can help create a support structure where none existed before... It is ironical that one is asking the state to support a machinery to promote action for change in state policies, but we have done it with great hope on the strength of the Foreword of the Seventh Plan which states that development is basically about people [Government of India 1989].

The current debate on the retreat of the welfare state in the face of onslaught from the process of globalisation of economy and liberalisation poses a fresh challenge to state support for such initiatives. The variations and conflicts in structures and processes of the community-based management systems and government-initiated systems of natural resource management have been at the centre of environmental debate. Unresolved political conflicts between local people and government have also contributed to uncontrollable exploitation and mismanagement of natural resources.

The liberalisation policy has heterogeneous elements which often work at cross purposes. Growing evidence from Africa, Latin America and Asian countries indicates that short-term measures taken to improve balance of payment situation or stabilisation programmes exacerbate environmental stress. As long as issues of survival and sustenance remain divorced from resource use programmes they will never take roots at the community level. Reduction of public spending will have an adverse effect on all programmes of ecological generation. Privatisation and deregulation of industries, emphasis on exports-led growth and entry of TNCs will pose a threat to the remaining common property resources and will contribute to environmental damage. The government has done precious little to force industries to internalise ecological costs. Agarwal argues that since the government has taken a decision to liberalise the urban industrial sector, they should carry on this liberalisation process to the rural sector as well by communitising the resources and letting the local community fix the price for resources and control its aquifers. Arguments of debureaucratisation and decentralisation have provoked debates on alternative institutions and mechanisms to manage the community resource base [CSE 1992].

Institutional Capacity and Gendered Space

As the economy becomes more market-oriented, institutional issues and accountability of systems of governance become important. The effects of fiscal and monetary policies on women is determined by the social matrix and gendered patterns of resource use and control in rural households. The concept of 'environmental justice' cannot be delinked from issues of equity and social justice. NGOs cannot cushion disadvantaged groups from adverse effects of liberalisation and global process of trade and economic relations which are strongly linked to environmental degradation in the south important. If investments in agriculture, land and water-based programmes and education, health and shelter, are reduced, decentralised development will be affected adversely.

In the backdrop of these challenges, what are the implications of the 73rd and 74th constitutional amendments empowering institutions of local self-government like panchayats and zilla parishads and providing one-third reservations for women. The 73rd amendment defines panchayats as institutions of self-government, to which state legislatures are required by law to endow "such power and authority as are necessary to enable them to function". The eleventh schedule transfers women and child development, anti-poverty programmes, elementary education, health, land reforms, forestry and conservation programmes, etc, to the panchayats. The question is whether this will mean genuine devolution of power to panchayats or will they be expected to fulfil only development functions? How is effective, informed and organised participation of women who will be elected to these bodies to be ensured? How is the dilution of the underlying philosophy of these amendments by state governments while amending state panchayati raj acts to be prevented? While the need for vigilant and informed pressure cannot be over-emphasised, are we expecting too much from women's representation on these institutions to correct gender imbalances in access to and control over community resources? We need to explore the gender aspects of natural resource use and management in diverse contexts including the contribution of women in maintaining biodiversity. It is important to contextualise the lives and struggles of women within different eco-systems and the historical processes that alter and shape construction of gender relations.

Neither technology nor economics can answer ethical questions relating to resource use. Are the bargaining structures at the micro-level adequate to deal with macro forces? While the global debates have been emphasising transfer of environment-friendly technology to the south, we are neglecting 'indigenous knowledge systems'.

The Rio Declaration at the Earth Summit acknowledges that women have a vital role to play in environment management and development from which they have been historically excluded. The relative power of various interest groups determines the environmental agenda although grass roots organisations for the empowerment of poor rural women have been identified as a critical strategy to counter such negative forces. The DAWN report suggests that "we go beyond the discussion of empowerment as good for women to the discussion of empowerment as critical for building accountability into the functioning of the public realm—both the state and the institutions of civil society—thereby the possibility of their transformations along with the transformation of gender relations" [DAWN 1991].

The environmental movement is a by-product of popular participation at the local level questioning national policies for natural resource management. The issue of local communities, setting their own environmental agenda where women have a voice in decision-making process, is a political question. Do we have an operational framework to discuss the trade-offs between local environment management and economic development policies. How local democracies in India shape and respond to ideological and economic pressures will be interesting to watch.

Gender has been increasingly acknowledged as a critical variable in analyses and development planning. Growing evidence from countries in Africa, Latin America and Asia, suggests that implementation of structural adjustment policies sharpen the conflict between the use of land and other resources for food production and subsistence needs and for commercial exploitation. Most of the governments see urban industrial sector as a key to growth and neglect rural agricultural sector. It is crucial to recognise the role rural women have played in providing household food security. The processes and institutional arrangements and the manner of women's participation are of fundamental importance, although not as yet well understood in policy formulations. The articulation of gender and poverty issue within SAP discussion poses a real dilemma between state's interventionist role and the 'market forces'. The organisational intervention did provide political space to women but the restructuring and market forces are going to erode it by redrawing the boundaries between the state and the economy.

Note

1 The paper was presented at the NSI-CWDS Conference on Structural Change and Gender in the Era of Globalisation. It is part of the ongoing project on 'The Impact of Macro-Policies on Women in the Period of Liberalisation and Adjustment: A Comparative Perspective from Canada and India'.

Gender Implications of Adjustment Policy Programme in India

Significance of the Household

Joy R Ranadive

This article seeks to emphasise the importance of accounting for the distributional effects of structural adjustment policies. While an attempt can be made to predict these effects if the programmes succeed, the far more urgent task is to assess the distributional impact of the costs of the transitional period, when due to special circumstances the household will act as a buffer for absorbing the shocks to the economy. Within the household, women will bear the brunt of the impact.

TODAY the issue of development has got inexorably entwined with stabilisation and structural adjustment policies. Developing countries the world over, since the early 80s felt the need to initiate reform packages which were supposed to improve the economic environment within which they were functioning. Due to a host of interrelated global factors these countries found themselves teethering on the brink of crises for which help was sought from the Bretton Woods institutions. Stabilisation policies are attributed to IMF prescriptive pre-conditionalities and structural adjustment policies to the World Bank. Stabilisation policies are primarily short term which manage or avert a crisis by reducing fiscal deficits, curtailing demand and lowering the rate of inflation. Structural adjustment policies are long term, in that, over time they seek to reduce market rigidities and open the doors of internal and external markets to competition. Together, these twin packages seek to increase the flexibility of an economy so as to make it less vulnerable to further shocks and to promote higher rates of growth.

Over time it has been recognised that due to the contractionary nature of stabilisation policies coupled with the long gestation gap before the results of structural adjustment manifest themselves, there is a transition period that the economy concerned has to go through. This transition period like any other, demands its pound of flesh. The transition period is justified on the grounds that ultimately when the policies bear fruit the economy will grow and this growth will more than compensate the socio-economic costs of the transition.

This paper seeks to emphasise the importance of accounting for the distributional effects of stabilisation and structural adjustment policies. (Since the two generally go together, they will be referred to henceforth in the paper as adjustment policy programme (APP)). On the one hand one can attempt to predict the distributional impact of an APP if it succeeds in practice as is theoretically envisaged. No doubt this will lead to debates on the necessity and sufficiency of growth to eradicate the kinds of perennial problems that beset developing countries. On the other hand, there is an immediate and hence more important need to assess the distributional impact of the costs of the transition period. The paper argues that due to certain special circumstances it is the household in the economy that acts as a buffer to absorb the shocks during this period. The pain of absorption is particularly acute for poor households which are already existing on the fringes of bare survival. And further, due to certain specific gender-related circumstances within the household, it is the woman that takes the impact within the buffer. In the light of the long-term interests of the economy, it is imperative for policy-makers to take serious note of this phenomenon. If neglected, the transition period itself can wreak long-lasting damage to the fabric of the economy. In such a situation, the very logic behind the APP is at stake since a sacrifice for the future could well prove to be a sacrifice of the future.

Policy-makers have a myopic view of the household due to reasons I will later elaborate upon. In actuality the household performs three important roles, of being a consuming unit, a producing unit and a distributing unit. It is the third role that is most significant as also the one that shapes the earlier two. And it is precisely this facet of the household that is lost to policy-makers. Juxtaposed with the distributional impact of the costs of the transition period, it spells a certain specificity in the way social safety nets should be formulated. This paper stresses upon the dire need of an adequate perception of the household in order to grasp the implications of the APP.

Adjustment Policy Programme in India

The APP in India is being associated with a package of policies adopted by the government of India in June 1991.[1] At that point of time, these policies were critical and in the nature of crisis-management measures since India was faced with a prospect of a fiscal breakdown and of defaulting on international commitments. IMF help was sought[2] and stabilisation measures were taken to improve the balance of payments situation and to contain inflation. Simultaneously, measures of structural adjustment were initiated wherein different areas of policy (trade, industry, etc) were altered to liberalise the market, to ensure an effective use of resources and to effect resource mobilisation. The budgets of the following years were likewise formulated keeping in step with these measures.

The debate that has since emerged is of the following nature. On the one side are advocates of the APP, on the other, the strong opponents and somewhere in between are the wary moderates. Those who favour the economic policies point to the background against which the steps were taken. India has from the beginning of planning in the early 50s, focused on a dominant public sector which undertook major infrastructural investments. The private sector produced foodgrains, agricultural products, virtually all consumer goods and many capital goods. However in an attempt to avoid monopolies and to channelise investment, production was subject to a system of licensing through which the government regulated private sector activity. A rigid set of price and quantity controls existed. Subsidies were introduced to protect certain areas of production as also certain segments of the population. Over time these subsidies expanded both horizontally and vertically. A high tariff wall protected domestic industry from outside competition. Import substitution was preferred to export promotion in a bid to achieve self-reliance. This system of rigidity proved useful in the first two decades of planning. Subsequently, there developed a new hierarchy of vested interests and inefficiencies permeated throughout the economy.

The 70s and 80s saw a number of critiques from economists and policy-makers who urged some kind of economic reform and saw deregularisation and flexibility as solutions. Further, there were large and persistent macro-economic imbalances since the 1980s. Internally, there was a widening gap

between the income and the expenditure of the government, which led to mounting deficits met by borrowing at home Externally, a persistent current account deficit in the balance of payments was inevitably financed by borrowing from abroad The Gulf crisis in 1990 further aggravated the situation India's credit rating in the international capital markets plummeted Against such a background, proponents of the economic reform package see it as a change long overdue The market forces of competition are viewed as essential to bring about efficiency in resource allocation and mobilisation A high sustained rate of growth is seen as the goal and APP the means to achieve it [Dhar 1992, *The Economist* 1991 Rangarajan 1992]

The objections to the APP have been many There are those that see the adherence to these policies as an abject surrender to the International Monetary Fund and as a loss of India's economic sovereignty [Arun Kumar 1991, Bhattacharyya 1991, Bidwai 1991] It has been argued that it is incorrect to pursue stabilisation and structural adjustment simultaneously since the latter cannot be effective until the former is achieved [Bajpai 1993] There is now no doubt about the fact that during structural adjustment it is the poor that suffer the most Numerous studies on the effect of structural adjustment programmes in developing countries have revealed that whatever be the specificities or details that operate in any particular economy the poor bear the brunt of the transition period [3] Hence the need for safety net which will protect the vulnerable sections of the population is acknowledged worldwide [Cornia 1990, Liebenthal 1990, Vyas 1993]

The moderates could be classified as those who see the need for economic reform of the APP kind in India, but raise questions about the way they have been initiated More importantly, they stress the importance of the safety net and question the government's approach to and intent towards formulating an effective safety net This contrasts with strong opponents who want to reject the APP in its entirety, and are even prepared to formulate an alternative policy package [4]

THE SAFETY NET

What is important at this point of time is that the APP has for the present, come to stay Over two years have lapsed since it was initiated and the government which has itself periodically survived internal crises, plans to continue with the programme in the years to come Since we are mid-way one cannot talk of the "effects" of the policies, however the transition phase has begun Gupta, Bal and Shankar (1993) have noted in their study of nearly 30 countries which are undergoing structural adjustment programmes, that almost no low income country could avoid a contractionary period of less than 4 to 6 years According to them, due to the heavy foreign exchange constraints, import compression and a relatively unfavourable international scenario, India will have to go through a painful prolonged period of adjustment

Significantly, the government itself in its discussion paper has acknowledged that,

> fiscal discipline forces limits on government spending and this may affect the pace of implementation of programmes in the social sector which are especially critical for the well-being of the poorer sections Economic restructuring may also involve loss of jobs in certain sick and unrevivable units as labour is redeployed into other expanding or new units [GOI 1993 p 19]

This is particularly so because expenditure on other "sensitive" sectors cannot be cut As outlined by Manmohan Singh,[5] interest payments are a fixed contractual obligation, defence expenditure is critical to the security environment, expenditure on government administration would result in a wage freeze and decline in employment and subsidies cannot be reduced overnight Consequently it was social sectors that had to receive the axe As shown in the *Economic Survey 1992-93*[6] although there is an increase in absolute terms in rupee crores, the percentage distribution of plan outlay to social services (education, medical and public health, family welfare, housing, urban development, other social sources) was 14 8 per cent in 1990-91, 16 3 in 1991 92 and 15 9 in 1992-93 Likewise, allocations to rural development (used largely in poverty alleviation programmes) were 6 7 per cent in 1990-91, 6 2 in 1991 92 and 5 6 in 1992 93

The inherent paradox lies in the claim the government makes regarding the safety net that it has envisaged [GOI 1993, pp 19 20] This net spells out three components—a National Renewal Fund which will finance schemes for compensation retraining and deployment of workers affected by restructuring, a strengthening of the Public Distribution System, a stepping up (relative) of expenditure on social sectors Assuming that the poor of the economy are the target group both of the social service and development expenditure and of the safety net, it seems illogical to deprioritise expenditure allotted for them on the grounds of a financial crunch and prioritise the same under the guise of a safety net

Of the three components of the safety net outlined by the government, not much has been done about the National Renewal Fund The second component, i e, the Public Distribution Scheme (PDS) in operation in India has much to be desired There are debates about whether it is pro-rich and urban biased [Howes and Jha 1992, Dev and Suryanarayana 1991] Besides, it has been found to be inadequate and ineffective in its reach and capacity to assist poverty alleviation There is no uniformity in the entitlement and allocation of foodgrains in the different states, the lack of purchasing power in the hands of the poor do not allow them to avail of their entitlements at the fair price shops (FPS), there is a discrepancy between local food habits and available rations, there is overcrowding at some FPS and underutilisation at others Besides, there is no alignment between the nutritional requirements of the population and the PDS [Hatekar 1993] The Revamped Public Distribution System (RPDS) which the government launched in January 1992 extended the PDS to 1700 specially identified blocks The aim is to provide a minimum quantity of foodgrains at specially subsidised rates to the most backward sections of the population residing in geographically difficult and remote areas However, it has been found that the RPDS has run into the same difficulties as the existing PDS [National Commission for Women 1993]

The importance of the third component of the safety net cannot but be stressed The problem takes alarming proportions when note is taken of the already weak existing social infrastructural base that exists in India According to a study on social sector expenditures and human development in India [Prabhu and Chatterjee 1993] although the actual allocations to the education in health sectors are at par with the average levels in Asian countries, the average level of human development in the country is low Hence it is imperative to substantially raise the allocations to social sectors Further, Prabhu and Chatterjee find a synergistic relationship between education health and nutrition which then require a simultaneous increase in allocation to these sectors The study also recommends a drastic reallocation of resources in favour of primary level facilities At present over 50 per cent of allocations in the education sector are towards elementary education This is inadequate as India requires over 65 70 per cent allocations in all states At present in the health sector, less than 20 per cent of government health expenditures, are incurred towards public health Even after including water supply and sanitation the expenditures on an average do not exceed 40 per cent which again is grossly inadequate If the goal of the structural adjustment component of the APP is to open up the economy to market forces and competition, whilst the stabilisation component does not allow for even a maintenance of the existing low level of social infrastructure it seems as if once again a major portion of the population who are ill equipped to participate in a competitive world would be left out of the development process The success stories of Korea, Malaysia and Thailand owe a lot to the existing pre conditions in these countries *vis a vis* the quality of their human re-

sources. For example, Korea had achieved a literacy rate of nearly 80 per cent by the early 1960s itself. Maternal mortality rates in 1980 per 1,00,000 live births was 34 in Korea, 59 for Malaysia, 270 for Thailand and 500 for India. However, in India the release of resources for human resource development at the moment is dependent on the success of the stabilisation and structural adjustment policies [*Economic Survey 1992 93*, p 15].

An important facet of the mechanics within which the APP works is the time span over which different reform measures act and begin to show results. Stabilisation policies are supposed to act in the short term, structural adjustment policies act over a longer period of time. The pain of transition is felt in the interim time. For similar reasons, the outlining and implementation of the safety net has to receive careful attention. Due to the experiences of countries who adopted similar APP over the last decade the socio-economic costs can be predicted. Hence the safety net should be intelligently and realistically forecasted and devised. Further, its implementation, should be so initiated that its effectiveness coincides with the pain of the costs. If this is not done, the safety net takes on the nature of compensations paid out after the damage is done. And this would be dangerous at one level and foolish at another.

Hence the problem of the safety net can be tackled at various levels. One, a genuine, serious attempt to predict what the socio-economic costs would entail. Two, to forecast the distribution of these costs. Three, to outline a corresponding safety net. Four, to realistically space and time the components of this net so that the pain of adjustment is cushioned. This of course is not a once-and-for-all exercise. The whole exercise has to be in the nature of an ongoing process which is periodically revised after scrutiny.

In order to intelligently devise an effective safety net, it is of utmost importance to understand where and how the costs of the transition period would be distributed. The APP would result in a modification of the structure of opportunity within which individuals have to adjust to cope with the changes. It has been found that different groups in each country of Africa and Latin America experienced structural change differently [Ghai and Hewitt de Alcantara 1991].[7] Likewise, different economic units within a country hear the impact differently.

The household, of all the economic units, serves as the buffer since it is within this locus that human beings reproduce and sustain themselves. Further, whatever be the effects within markets in agriculture, industry, etc, the repercussions reverberate at the household level through their effect on the demand, supply and price variables that any household *per se* adjusts to.

The Household

In order to understand how the household becomes the buffer to take the impact of the transition period in the APP, I will first outline the importance of understanding the concept of the "household". As is generally known, the human being has long been established as a social animal who co-habits, co-exists and lives in groups. It is also known that in all human societies domestic groups are family- and kin-based. These groups have been an expression of society's mode of organisation and are also part of a larger social structure. Policy-makers operating at the macro-level do not have a realistic perception of the household because of which the true impact of policies are not identified. Policies are governed by the rule of the economic regime wherein economic parameters serve as indicators and steps taken usually have to make "economic sense". Consequently, the viability of projects/programmes are judged by the economic gain they rake in. Further, the rule of the economic regime extends in that, it is concepts and visualisations of Economics as a subject that govern policy-makers. The perceptions of other social sciences like Sociology and Anthropology which are often more realistic (especially regarding concepts like the "household") are bypassed for the visualisation from Economics. Again, this visualisation is that of mainstream Economics, largely governed by neoclassical tenets, as against those of relatively more realistic heretic streams of economic thought.

Consequently, the household is used as a unit of anlaysis and not as a unit *for* analysis. Neoclassical economics has opened up the firm for analysis but not the household. It visualises the latter as a collection of members, no doubt with differing needs, tastes, preferences, but interrelationships between whom are not explicitly looked into. As Galbraith has rightly said,

> neoclassical economics resolves the problem of burying the subordination of the individual within the household. Then it recreates the household as the individual consumer. Then the matter remains. The economist does not invade the privacy of the household [J K Galbraith 1973, p 51].

This makes one wonder that perhaps if the "family" was used as a conceptual tool as against the "household" an element of realism would be introduced. However, within the subject of Economics, the consideration of the "family" too is as unrealistic. There is at one level the usual visualisation of the family as a "glued-together" unit where individuality is absent and only family decisions are taken.[8] A model deviant from mainstream economics envisages the family as a super-trader [Becker 1974, 1981]. Here individuals are assumed to be relentlessly pursuing their individual utilities and in so doing they enter into trade at implicit prices. Marriage is seen as a two-person firm with either member being the entrepreneur who hires the other and receives residual profits. A third visualisation is of a despotic head who has complete command and takes all decisions. Here, the family behaviour reflects this head's choice function. Even if they consider kin-relationships and some kind of interactions between members, these visualisations are unrealistic abstractions of the way families really function [Sen 1983].

Another limitative visualisation of the family is that of the nuclear family which consists of the husband (generally conceived of as the bread-winner), the wife (often a dependent), and unmarried children (also dependents). The household in mainstream economics implicitly assumes a nuclear family and also assumes as exogenously given, a set of culture boundaries, allocation of rights, duties, responsibilities, tasks, resource distribution, etc. It is implicitly assumed that there is a stable monogamous conjugal pair—who together make decisions, carry out actions and manage resources. It is assumed that the married couple bear the costs of their children jointly and at the same time, however, it is also assumed that the mother bears the total costs of time.

However, the visualisation of the family as nuclear is limitative since it is but one case. In many societies there are other kinds of families in existence, some simpler, some more complex, where the structural composition of the family can be quite different from that of the nuclear family. Further, there is dynamic interaction between members resulting from different aspirations and different opportunities. These result in different behaviour patterns across families. These patterns in turn may be governed by non-market rules, conventions and a sense of propriety. Various patterns of systematic discrimination may be built into that sense of propriety as to who should get what. It can also happen that family members may not have a clear perception about their welfare. Instead there may be a compounded family welfare that is sought which paradoxically can have an inbuilt bias in favour of some members than others.

The Three Roles of Household

The household can be viewed as an institution which as per the society, the time, and the culture has become a regularised mode of co-habiting behaviour and existence structurally based on a kinship pattern. Across the world different types of households exist and in a country like India, itself with a myriad of peoples, one finds householding of many varieties. However, one factor cuts across these diversities and that is, the roles that any household *per se* performs.

The household is a consuming unit,

wherein it constitutes demand for goods and services. These goods and services are supplied from the outside world (S_O) and also from within the household (S_H). Hence, the consumption at an aggregate level for any household would consist of goods supplied from outside (C_1), services supplied from outside (C_2), of goods supplied within the household (C_3) and services supplied within the household (C_4). Macro-level policies directly affect S_O and the household as a single unit has no control over it. It however can manipulate S_H.

The household is a producing unit,[9] wherein it constitutes supply for goods and services These goods and services are demanded for by the outside world (D_O) and also by the household itself (D_H). The household consequently produces goods for the outside world (R_1, marketed and hence priced); services for the outside world (R_2, again marketed and priced), and also goods for own consumption (R_3) and services for own consumption (R_4).[10] As a producing unit the household has no control over D_O which is directly affected by macro-policies. It can however alter D_H in its attempt to adjust.

The most important role of the household is of a distributing unit. The household based on a configuration of cultural, religious, social and economic norms, distributes resources and time (hence work) amongst its members. These distributive rules determine the patterns of consumption and production, i e, the allocation among members of C_1, C_2, C_3, C_4 and R_1, R_2, R_3, R_4, as also the aggregate levels of consumption and production. Hence the third role governs the first two.

The household makes an assessment of (1) the needs and (2) the contributions of its individual members and distributes (a) resources/income (which can be interpreted as a basket of goods and services) and (b) time (hence work and leisure) accordingly.[11] At one level the distributive rules determine who consumes what goods and services and how much. Consumption is distributed according to an assessment of both needs and contribution. For example, social, cultural and religious norms (I shall call them non-economic norms) may ascertain that a male in the household requires more food and nutrition than a female. Further, if the woman's contribution is exclusively in terms of domestic work (R_3 and R_4) then the assessment of her contribution is marginalised since it does not fetch an income from the market. Hence, an economic parameter of monetary gain determines the assessment of contribution and to that extent the rule of the economic regime enters valuation within the household too. To cite another example, the male child is often seen as superior to the female because he is expected to be a support to his parents in their old age whilst the female child will be married and of advantage to another household. As a result, the boy is an investible resource (hence receives prompt medical attention) whilst the girl is a wasted investment (hence is relatively neglected).

Likewise, the non-economic and economic norms set the distributive rules which determine the pattern of production. Non-economic norms are responsible for a sexual division of labour wherein by and large the woman is supposed to undertake the domestic production of goods and services. Hence R_3 and R_4 are largely the woman's responsibility. R_1 and R_2 can be undertaken by both men and women but at times in spite of the economic necessity of the woman's participation in R_1 and R_2, non-economic norms may not permit her to engage in them.

It may seem here that the household is again being portrayed as an individual consumer as is in neoclassical economics. This however is not true There is no such thing as a common table of tastes and preferences of a household. However, quantifiables like demand, supply, consumption levels, production levels can be aggregated. Even so it is the disaggregation of these aggregates that throw light on intra-household disparities. Further, when it is said that "the household sets the distributive rules", I am talking about the code of conduct for activity that each household as a collective, sets for each of its members, which is a result of the configuration of non-economic and economic norms that it sets store by.

The household does not act in isolation of other households or other units within the economy. It interacts with (1) the community which comprises of other households in the neighbourhood; (2) other members of kin comprising of relatives who do not stay within the domain of the household and (3) other economic units.

Within the productive role, the household performs the important task of the production of human resources. Due to biological reasons, the production is tied to the reproductive capacity of the woman to have and bear children. But due to non-economic norms, the maintenance and nurturing of these resources is tied to the sexual division of labour which directs the responsibility to the women in the household. Human resources is the one factor of production that from the time of its inception to its maturity is in the nature of capital formation wherein investment of time, effort, goods and services have to be made. Upon maturity, however, it takes the form of labour. Hence it changes in character from capital to labour and in form from good to service. The production (biological reproduction and maintenance) of these resources take place largely within the household. And it is the distributive rules that allocate who in the household invests what and how much in their production.

How the Household Is a Buffer

The interface between macro policies such as the adjustment policy programme and the micro unit of the household, lies in the latter acting as a buffer that absorbs shocks released by the farmer. In the event of any change in the economy, the household's prime concern is to survive. This is particularly true of poor households within which one third of India's population lives.[12] It has been found across countries and cultures that the responsibility of the survival of the household rests on the shoulders of the woman.[13] That the family is fed, clothed and cared for is the woman's concern since it ties up with her share of work as per the sexual division of labour. This she does irrespective of her contribution to R_1 and R_2 and also irrespective of her direct access to resources/income. In male-headed households it may be carried out on the basis of a partial control of resources, whereas the responsibility is explicit in female-headed households.

The transition period of the APP unleashes certain forces which make survival for the poor households more difficult. As things stand today in India, the consumption basket is becoming relatively dearer. The S_O variable that the household faces is altered in that due to overall increasing price cutbacks in the government's social sector expenditure, the goods and services supplied in the market are less accessible to the household. Hence either the total level of consumption of goods and services of the household drops or if the aggregate level is maintained, the allocation of goods and services across members is so changed so as to accommodate the shortfall. This shortfall is made up of by altering S_H for which R_3 and R_4 have to be increased. An alternative of course exists in increasing R_1 and R_2, but this is subject to changes in D_O. If D_O so changes that employment opportunities increase for members of the household then the corresponding increase in income could help in combating the shortfall.

Likewise, the S_O variable could be altered say, by a shift in agricultural production from cereals and coarse foodgrains to exportable crops, or by a reduction in food and fertiliser subsidies snowballing in an increase in the prices of foodgrains. Whatever be the reasons when S_O becomes relatively inaccessible to the household, survival becomes correspondingly difficult. To compensate for the lacunae and to ensure that the family pulls through, the pressure increases on the woman. It entails an increase in time and effort on her part across R_1, R_2, R_3 and R_4. When the food basket becomes more expensive it spells searching for cheaper alternatives, making frequent trips to the market since the commodities cannot be bought in the same quantities as earlier,

cutting down on the purchases of other commodities, longer hours in food processing. When health or education services become inaccessible or expensive they have to be replaced with effort at home. Goods and services produced in the market become short in supply *to the household* due to their inaccessibility and have to be replaced with those produced at home increasing the time and effort going into R_3 and R_4.

Similarly R_1 and R_2 also have to be increased. On the one hand the transition period due to contractionary and pruning policies fuels inflation and unemployment, on the other hand it opens up employment opportunities in areas like export processing zones [Deshpande and Deshpande 1992]. These are exactly the kind of circumstances that compel women in poor households to seek employment in the informal sector or in export processing zones where the returns are paltry and conditions of work deplorable.

IMPLICATIONS FOR THE WOMAN

Hence totally across R_1 to R_4 the pressure increases for the woman. She has to, in an attempt to manage the household and ensure its survival, balance between her contribution towards R_1, R_2, R_3 and R_4. However there is a limit to her capacity both as a human being and in terms of time available. Consequently either R_1, R_2 may suffer a setback or R_3, R_4. If it is required that she contribute more to R_1, R_2 then this often rebounds on the girl children in the household since they have to take over R_3 and R_4. The transfer occurs across women since the existing sexual division of labour does not alter. This could be further reflected in a fall in school attendance, school drop outs and falling levels of health and nutrition of girl children. If on the other hand R_3, R_4 cannot be transferred the woman's contribution to R_1, R_2 could be less than expected by market signals or else R_3, R_4 suffer to the detriment of other members especially the aged, sick or infant members of the household.

The APP is based on an inherent elasticity of adjustment optimism. Policy makers believe that variables, say, demand and supply will adjust to market signals like prices. They do not account for non economic rigidities and bottlenecks that could impede the adjustment process. Likewise they believe that however difficult surviving becomes, poor households will pull through and devise coping mechanisms to look after themselves. While this may be true there is a limit to women's capacity to adjust and it may so happen, as Elson cautions, that breaking point may be reached [Elson 1993]. Moser's study of an urban low income community in Guayaquil, Ecuador, shows just how difficult women have found balancing between R_1 to R_4 [Moser 1989]. Out of the 141 households surveyed, only 30 per cent managed to cope. In 55 per cent cases the women were staking the lives of their children, especially daughters to survive. And in 15 per cent of the households the children were going astray and family crumbling. As Moser says, 'Not all women can cope under crisis and it is vital that the romantic myth of their infinite capacity to do so be debunked.'

An important fall-out of reaching this breaking point lies in the effect it has on the production and maintenance of human resources [Cornia 1990, Elson 1987, 1992a, 1992b, 1993]. When the impact of absorbing shocks during the transition period in structural adjustment falls on the woman, in the long run the production and maintenance of human resources suffer. Elson (1993) points to how the production of human resources is different from the production of any other resource. The former has an intrinsic value besides having an instrumental value. If the demand or market value of a resource dropped beyond a minimal low level its production is abandoned or stopped for more lucrative options. But if the maintenance of children became difficult mothers do not abandon them and consequently the pressure is absorbed by the women.[14]

It may seem here as if the ensuing argument sees the woman only as an instrument of biological reproduction and producer of human resources, with no inherent value herself. This is not true. The purpose of the argument lies in pointing out that since policies and policy makers are governed by the rule of the economic regime even adherence to this narrow rule cautions one about the effects of the transition period. It makes economic sense to take into account the danger of an erosion of human resources since a qualitatively weak human resource base does not bode well for any kind of future development, economic or otherwise. Further inasmuch as the woman is seen only in an instrumental perspective it is because of the marginalisation of her contribution to the economy. Only when women form part of the labour force do their contribution enter statistics and hence national income accounting. However, unpaid domestic work which forms a considerable contribution to the national product is not accounted for. No doubt there are practical difficulties in measuring unpaid work as also conceptual problems[15] but the underlying reasoning of this marginalisation lies in the fact that it does not fetch a remuneration from the market. And a fall out is the under-valuation of the woman.

Independent of whether the woman's contribution to the economy is significant by economic standards, she does have an intrinsic value of her own. As a human being her right to a life of meaningful existence and dignity cannot be denied. If the health, nutrition and mortality statistics of women and girl children show a deterioration, it is a negative signal for society irrespective of their roles as producers.

It would also seem from the paper that the woman is only a victim who passively adjusts to the distributive rules set by the household. This is again not entirely true. In the first place it is the behaviour of people over many years that set non-economic and economic norms which in turn determine the distributive rules. Secondly, no one person is always a passive victim just as no one person always an active formulator of rules. Women at a point of time operate within a given set of distributive rules and are subject to them as are other members of the household. But changes could occur in the distributive rules due to an outside stimulus. This stimulus could be marriage, migration or an economic crisis brought on by an APP.

Since the lives of women are largely governed by the mechanics within the household their coping strategy has to be seen from two angles. One, the method of coping when the household's well being is at stake and the woman does not see her own well being as different from the collective well being of the household. Often it is this kind of attitude that explains why in the face of inequality and deprivation women do not protest or question [Sen 1990]. The lack of a personal perception of welfare combined with a great concern for the family helps to sustain existing discriminatory rules of distribution.

The second dimension of coping strategy lies in the woman having some perception of personal welfare separate from and perhaps in conflict with the perception of welfare of the household/other members of the household. She then has to make space for herself within the existing distributive rules even whilst attempting to alter them. In this strategy she copes with the intra household gender specific disparities in distributive rules with respect to (a) income/resources and (b) time. For example, Sen sees the household to be a scene of co-operative conflict where spouses have different goals and strategies. There are a number of potential solutions that can be reached but the final solution is an outcome of the relative bargaining abilities. Significantly, bargaining ability here is not a personal negotiating skill. Factors like a perception of self-worth, of actual ability to earn a market income or bring valued resources into the household, the value to the contribution given by other household members influence bargaining ability [Sen 1990].

To go back to the argument about the transition period of the APP pushing the woman towards breaking point, the implications of the second dimension of coping on the part of the woman raises more questions about the ability of the household to absorb the shocks. Even if one accepts that mothers do not abandon children in times of crisis, necessity may transfer the burden to more vulnerable members of the household which comprise of children, and particu-

larly girl children Taken collectively it seems that the household copes, survives and absorbs the shock [16] But the distribution of costs across the members is uneven and the production and maintenance of human resources comprising one-third of the population is jeopardised

Likewise, within the economy, the distribution of costs across economic units is uneven and the household bears the maximum impact This is because even if individuals participate in economic activity within the framework of other economic units, the questions of sustenance and survival are ultimately traceable and have to be answered within the framework of the household In the light of these arguments, the questions that arise are,

(1) Given an existing set of distributive rules within household, what are the changes in consumption and production patterns that will be initiated by the macro stimulus of the transition period during the APP

(2) Will there be a change in the distributive rules due to a change in estimations of needs and contributions of members within the household?

(3) Will the economic/non economic norms alter? If yes how?

(4) In coping on behalf of the household will the woman reach breaking point? Or will she be able to transfer the pressure to other members perhaps children? Or will she collectively with other women in the community devise alternate coping mechanisms?

(5) Subject to question (4) as a result of the coping strategy does the household survive at the expense of the woman or the woman at the expense of the household or do both pull through?

Gender Bias and Safety Net

We have seen that there is an inherent male bias in the formulation of the seemingly gender-neutral macro APP in that it does not account for the cost and investment of time and effort on the part of women in the production and maintenance of human resources The implications of this bias range from a miscalculation of the effects of the macro-policies to a very misunderstanding of basic key concepts of the APP like 'productivity' and 'efficiency' [17] Further it has been argued that different policies affect men and women differently, note of which is not taken by policy-makers [18] Since the formulation of the safety net is now part of the formulation of the APP the arguments towards engendering policies also extend towards the safety net

In sum, the safety net has to be pre-emptive rather than curative or compensatory It has to serve as a cushion that enhances the survival chances of poor households in a recognition that it is the household that forms the buffer during the transition period It has to be gender-sensitive in that it encompasses measures which redirect resources directly to women and indirectly through health, education, services, water, supplies sanitation faculties, and public transport which then aid them to manage the household as also to participate in market activity

In the light of the above argument a certain specificity emerges in how the safety net should be identified and devised It has already been argued by the UNICEF in their advocacy of "adjustment with a human face" [Cornia, Jolly and Stewart 1987] that structural adjustment policies should be so formulated that the costs to poor households are reduced and their capacity to survive the crises be enhanced The response to this report was the emphasis on safety nets laid by the World Bank and echoed by the countries undergoing the programmes The safety net outlined by India is also of this nature where the "vulnerable" are sought to be protected However, the intent and purpose of this approach has been questioned and criticised by Elson who advocates "transformation" as against "protection" Elson advocates the transformation of social relations of production and reproduction According to her there can be "adjustment with a human face" only if strategies for struggle are aso outlined along with strategies for survival [Elson 1992a]

Conclusion

In conclusion it can be said that unless the unit of the household is opened up for investigation the true impact of the APP cannot be identified, without which an effective safety net cannot be devised Even if one stays within the narrow confines of the rules of the economic regime it makes 'economic sense' to protect the erosion of a valuable factor of production The choices made now have an irreversible inter-generational impact But what is actually required is a vision that goes beyond the economic regime without which there will be neither sensitivity nor realism in the formulation and implementation of economic policy The need is immediate considering the reach of the APP both in space and in time

Notes

[This is a revised version of the paper presented at the Conference on Structural Change and Gender Relations in the Era of Globalisation, September 30 - October 1, 1993, Toronto, Canada
The paper is part of an ongoing project examining the effect of macro-economic policies on the lives of women, conducted jointly by the CWDS New Delhi and the North-South Institute Ottawa, Canada, funded by the Conference Board of Canada. The paper was prepared before the union budget of 1993-94]

1 It has also been argued that the process of deregularisation and liberalisation had already been set into motion earlier by Rajiv Gandhi However, in June 1991 the programme was formally initiated

2 Substantial withdrawals have been made from 1990-91 onwards under one facility or other Besides, the Reserve tranche drawings of SDR 487 million (US $ 666 million), India drew SDR 1 269 million (US $ 1 814 million) from the Fund in 1990-91 In 1991 92 the drawal was SDR 905 million (US $ 1,240 million) India made a 20 months stand by arrangement with the Fund in October 1991 for a total loan of SDR 1 656 million (US $ 2,262 million) two instalements worth SDR 270 million (US $ 382 million) were drawn in 1991 92 In April-December 1992 SDR 924 million (US $ 1,306 million) has been availed of leaving a balance of SDR 462 million (US $ 650 million) to be drawn till May 1993 (Economic Survey 1992 93, p 117)

3 There is now considerable amount of literature analysing the experience of developing countries in sub Saharan Africa Latin America, the Caribbean etc with adjustment policy programmes For example Afsher and Dennis (eds) 1992 Sen and Grown 1985 Singer et al 1991 Sobhan 1993 Taylor 1991 Vickers 1993 Ward 1990

4 A Preparatory Committee for Alternative Economic Policies has been established in New Delhi This committee comprises of members opposed to the new economic policy (NEP) in India and presents a forum to come together to devise an indigenous alternative to the NEP The Committee believes that India has enough resources to solve its problems without help from the Bretton Woods Institutions

5 Foundation Day Lecture of Manmohan Singh, Finance Minister at Environment and the New Economic Policies New Delhi June 17 1992

6 P S 48, 2 61C plan outlays by Heads of Development Centre States and Union Territories (1990 92 1992 97)

7 Ghai and Hewitt de Alcantara make an interesting analysis of how the APP in Africa and Latin America changed the life chances of different classes as also of different categories of people within the same class Their analysis includes the upper class the salaried middle class as also the working class

8 The glued together terminology is used by A K Sen 1983

9 Production is taken to mean an alteration of form or composition so that the new commodity or service is differentiable from its earlier form or composite components

10 There would be an overlap as regards the supply and also production of certain goods and services For example a good may be initially produced outside the household but further processed and hence ultimately supplied from within the household For analytical purposes we consider the end product/service in determining whether its supply/production was made outside the household or from within

11 The intra household disparities in allocations of resources have been studied its a theory of entitlements (Sen 1987 1990 Papanek 1990) There also have been individual studies which observe resource allocation within households in developed capitalist societies, transitional societies and subsistence economies (Young 1992)

12 Given a minimum per day energy requirement of 2 400 calories per individual in the rural areas and 2 100 calories in the urban areas, the Planning Commission has estimated the incidence of poverty in 1987 88 to be 33 4 per cent in rural India, 20 1 per cent in urban areas and 29 9 per cent at an all-India level

13 In the use of the word 'woman' it may seem here as if the visualisation is limited to that of

a nuclear family This is not so In non nuclear families it is the women in the household that share the responsibilities However the distribution of power and authority differs across women since all women in a given household are not equal Often older women have more space and authority hence more rights and less responsibility I use the word woman in a symbolic manner to differentiate across gender

14 When surviving becomes more difficult one effect could be in less children being born but at that point of time the rearing of the existing number of children poses problems

15 For a discussion of these problems see Lucella Goldschmidt Clermont 1982

16 Here it is critical to *define* what is meant by a breaking point At an extreme level one can take death of member(s) to mean a breakdown In such a circumstance even if there is a drop in nutritional levels but the members survive (live) then it can be interpreted as coping If on the other hand a certain minimum floor level of sustenance is stipulated and the crises causes the members to slip below that level causing a disruption in their lives it can be taken as a breaking point In a typically micro economic sense (used by policy makers) a household as a unit would be said to cope if its members somehow manage to keep body and soul together

17 For a discussion see Elson 1992a 1992b

18 The gender impact of development policies *per se* has been an important issue on the mandate of women studies scholars as also women s movements It started across the world way back in the late 60s and in India in the early 70s There is considerable literature generated that investigates the gender impact of structural adjustment programmes ever since they came centrestage of development policy

Women and Technological Change in Rural Industry

Tile Making in Java

Juliani Wahyana

The introduction of new technology in tile making in Java has disrupted the social relations among its people in particular between men and women Sexual division of labour gets reconstituted with shifts in production methods and technology, but at any given point of time acts to distribute power, resources and authority in ways that keep women subordinated In this shift a new sexual division of labour often becomes more disadvantageous to women

I
Approaches to Technological Change and Women

MANY analyses of the impact of techno logical change on women have mainly dealt with the economical aspects of such a change [1] For instance according to the neo classical model unemployment caused by technological change is only temporary If the market is freed automatic compensation will occur [Goodman 1987] In the Keynesian model the government has a greater role in influencing market demand for products resulting from technological innovations and thereby balance the increase in labour productivity by additional employment generation Increased productivity employment opportunities and income distribution are the central theme of economic models in analysing the impact of technological change

In such analyses impact of the introduction of new technology is studied in terms of changes of the conditions of wage employment While in many third world countries, the labour force is not completely integrated into the wage system as Whitehead argues wage employment coexist with other forms of production of various kinds so demands on labour do not necessarily operate according to the principles of the labour market and wage employment' (1985 29) In addition, many people in third world countries do not earn the so called family wage in which one wage is sufficient for the whole family Thus women have to contribute to the family income through their involvement in production either as paid or unpaid labour Moser and Young say

> the stereotype of the housebound wife holds true for only a limited number of women [in third world countries] since just a small percentage of men earn regular wages Most working class women have to supplement the family budget by undertaking a variety of paid unskilled income generating activities Without this active economic participation, their family would not survive (1981 56)

The inadequacies of economic models to integrate women in their analysis is a challenge to feminist theoretical scholars to come up with a more comprehensive approach [2]

According to Brown (1981) technological change or technological upgrading is defined as the integration of a new package financed out of own or borrowed funds into established patterns of production and marketing The definition implies that technological change is a process which changes over time A new technology or a new package of technology is a response to a particular situation in the society This situation is conditioned by the social organisation Consequently there are, implicit in this package of technology, certain assumptions regarding the social organisation in which a new technology is introduced Meanwhile, the society in which the innovation is introduced is not a passive recipient rather it actively regulates itself to the requirements of technology or rejecting or redirecting the intended use of the technology [Stamp 1989] The law of action and reaction also holds true in this case

As technological change is a process the impact of such a process on women becomes complex On the one hand, the allocation of labour between women and men is governed by the social relations On the other hand, the same social relations may change due to technological innovations Consequently, the allocation of women s labour in tasks, activities, and production may and will alter

An example from Java illustrates the above phenomenon In Java like in many other developing countries, modernisation in the agricultural sector, or to be more specific in rice cultivation, began through the introduction of High Yielding Variety (HYV) rice The traditional variety of rice used to be cut in stalks with 'ani-ani' knife (a traditional small knife for rice-cutting by women) Due to the introduction of the short grains of HYV, the use of ani-ani knife for harvests has become obsolete For the new varieties of rice, sickles are used Sickles are considered as men's tools for they are 'big', 'heavy', and 'dangerous', therefore only men are supposed to use them Men took over the task of rice cutting Indeed the use of sickles reduced the workdays necessary for rice harvest from 200 to 75 per hectare [Collier cited in Kerstan 1992] Along with this it led to a massive displacement of rural women wage workers who had worked as harvesters However, this situation did not last long as the women tried to respond to the new situation by upgrading their skills to use the sickles Little by little women are now reclaiming their share in harvesting

The introduction of new technology (HYV) generated altered relations of production between the sexes (men's taking over women s task of rice cutting) which stimulated in turn another set of new gender relations (women s ability to use 'men's tool) and reclaiming their original sphere of rice cutting Yet we still tend to see technology as a physical rather than social presence Technology is not only the hardware but also the software

Economic models are inadequate to explain the detriment to women in the face of technological change Women are involved in production in a different way compared to men Women and men do specific but different tasks in production This allocation of tasks is a set of specific social relations shaped by the ideology and cultural norms regarding the appropriate roles between men and women

Household and Impact of Technological Change

Whitehead (1985) argues that family-based household relations between men and women determine the terms on which women and men enter into wider economic political and social relations Traditional economic models usually see households as a democratic unit in which all members will obtain the same rewards from their labour and the same benefits from technological innovations However as many studies show, this assumption is arguable One of Palmer's studies (1978) which deals with technological change in agriculture for instance, show that the introduction of new technology in the forms of HYV has result-

ed in the more intensive use of female family labour among farming classes[3]

Sen's analysis of the distribution of fruits of technological change has been very useful in understanding the above phenomenon i e the more intensive use of female family labour within a peasant household According to him households face a dilemma—its members are required to co-operate to add to the family s prosperity they also face conflicts on how to divide this among members A technological interdependence makes it fruitful for the different parties to co operate but the particular pattern of division of fruits that emerges from such co-operation reflects the bargaining power of the respective parties [Sen 1985] Thus, in the case cited above women in the farming households face an unseen force', i e, they have to work more intensively due to their relative position and bargaining power in the household Their bargaining power in turn is determined by the existing pattern of gender relations

The power relations between (or the bargaining position of women and men), in the case of a husband and wife will determine the outcome in a new situation Thus, if the initial bargaining power between a husband and a wife is already unequal in which one has relatively more power than the other, then the outcome of a new situation will be better for the one that has the power This outcome is manifested in for example, the distribution of income and consumption within the household

With regard to cash income, many studies indicate that it is usually men who have the primary control over the family cash income For instance in south Gujarat, the wages paid for work done by women and men for agricultural labour households are usually handed to the male members [Breman 1981 in Agarwal 1985] This is also true in the context of Malaysian plantation workers (Heyzer, 1980 in Agarwal, 1985)

However the way in which income is spent may vary according to who controls it In many instances if women have some control over expenditure than they tend to spend the money on family needs, whereas men tend to spend it on their own needs Although in societies in south Asia, for instance men also share responsibility for the subsistence family needs, the tendency is that the relative sharing of food and cash between members of the household could nevertheless still favour the men [Agarwal 1985] This is apparent in the sharing of food amongst family members There is enough evidence to show that the actual distribution of food and nutrition tends to favour men relative to the women in large parts of the third world Male members of the household are usually given the best diet in terms of quality and quantity [Agarwal 1985] Chatterjee (1989) in one of her studies on women's health care showed that in India women are amongst the worst victims of sickness, disease, malnutrition and premature death Mortality and sickness rate is higher among women

The unequal distribution of food and consumption in the household is an indication of how women are valued In poor households, food as a means of survival is very crucial for the upkeep of all members However, due to norms and ideology, women are ascribed as secondary earners and male members in the households are regarded as primary or potential earners It goes without saying that this normative depiction affects the distribution of food in the family in which women are given the second priority Chatterjee (1989) shows that in India even a male child is treated preferentially compared with his mother He receives a food ration more than his lactating mother

These examples from south Asia and south-east Asia show that a model which sees the household as a democratic unit is misleading Household's member's interests are different one from another, and the way the household distributes its availabilities to each member is unequal depending on each member's position in it From this, a link can be drawn to technological innovations If there is a change in the household's total prosperity as a result of technological innovations, the fruits of such a change to each member will be determined by each member's position in the household As it is apparent that women's position in the households are usually lower than men, women tend to obtain less than men

II
Gender, Class and Sexual Division of Labour

The terms under which women's work is performed influences the effects of technological change on women It is true that all women do not belong to the same class It is also true that women of all classes do not perform tasks in production under the same production relations as their men There are women who work as wage labourers and there are other women who belong to 'owner' class but the female wage labourer has different terms than the male counterpart and the female in the 'owner' class would be not 'owners'

> It cannot be argued that women's work is all characterised by the same set of employment relations, nor do the social relations of work take the same forms for women as they do for men [Whitehead 1985 33)

The impact of innovations on women will be different for different classes of women Palmer (1978) shows how the introduction of HYV did not create jobs for women Women wage workers lose jobs when the task they perform is mechanised and women who work as family labour face the intensification of their unremunerated labour Both sets of women face negative consequences

Another feature that needs to be looked at when considering the impact of technological change is what Whitehead (1985) calls 'sex-sequential' nature of production process in which women's labour is put into a specific sequence For instance, in rice cultivation, women's labour is put into specific tasks in a crop cycle such as weeding, trans planting, harvesting, and storage while men prepare the land A good explanation of this sex-sequential production process is given by Deere

> The division of labour by sex is conceptualised as an aspect of the labour process, although an economic category, its specific form and content is determined by the mutual affectivity of the ideological, political and economic aspects that characterise the social formation [Hence] the division of labour by sex is rarely static but changes overtime it is more than a socio cultural convention and is responsive to material conditions of production [cited in Tadesse 1982 80]

Social relations which are often governed by cultural norms and ideology are not static Society, social relations as well as sexual division of labour change in response to new situations The fact that female workers, who are generally paid less than men for their work in the fields, have started using the sickles—a man's tool—serves as an example for the proposition that it is possible to affect a breakthrough in the traditional sexual division of labour [Kerstan 1992]

Studies on the impact of technological change focus only on some categories of labour relations—those women who work as family labourers or women as wage workers There is another category of women that is often missed—that is women as independent producers (in case of agriculture female farmers) Female-headed households can also be grouped in this category What would be the impact of technological innovations on these women?

Although female entrepreneurs can be considered independent producers when compared to women wage workers and women who work for the family, yet they are not operating in a gender free world Independent though they are, they are also constrained by the gender relations surrounding them Therefore, in order to analyse the impact of technological innovations on these women one needs to examine factors which limit them from getting the optimal benefits of innovations such as access to various resources which are of significance for obtaining the fruits of technological change.

Access to Land Capital and Information

Land is one determinant that is usually used to measure a peasant household's welfare situation The more land they have, the better-off their situation is However, this crucial factor is not distributed equally among the peasant households As has happened in many third world countries along with the modernisation in the agricultural sector, the distribution of land has become more and more skewed Land ownership is concentrated among a small number of households, with the majority of households having little or hardly any land However, this situation is not that dramatic if those who belong to landless or near landless households still have access to it What happens is that they have neither land nor access to land This situation becomes worse when it comes to women In most third world societies, women s rights in land are use rights rather than outright ownership rights [Whitehead 1985] Although according to law and customs women may have the legal right to own land, in practice the situation is different In Java, for instance according to inheritance customs men and women may have equal share of the land, but in practice boys have greater claim than girls [Kerstan 1992]

Women s access to use rights is also usually determined by their relationship with a kinsman like a brother, a father, or a husband [Whitehead 1985] Thus in this sense women s access to use right is not secure

> The way in which kinship status determines her access is in any case rather different from that of men for men s rights to land are mainly inherited whereas women's depend on an extant relationship with a living individual Thus insofar as this relationship is liable to dissolution (through death divorce or separation) and her residual claims may be non-existent or difficult to enforce, her rights are often insecure [Whitehead 1985 54]

Capital in the form of credit is of importance as a means to acquire and mobilise resources However, like the case of land, not all groups have equal access to formal sources of credit Poor groups in general, and women among the poor in particular face restrictions in access to credit and financial institutions These restrictions limit the potential for increasing the productive contributions of these groups and further distort the distribution of income and asset ownership A case in point regarding obstacles in acquiring credit is that they do not have a collateral or if they do they cannot use it as freely as men In many cases, male heads of household hold title to land or other property and are required to sign for loans Where businesses are accepted as collateral, for instance, women may not be considered good credit risks because they are engaged predominantly in small-scale informal enterprises and may not have documentation of formally registered business [Schumacher, et al 1980]

Although there is no law which discriminates women from taking loans and credits from banks, almost everywhere that they are less available for women than for men The discriminatory ways in which finance is disseminated is not always sex-specific though it does affect women more A study showed

> Legally, there were no barriers against women applying for loans however their chances of getting loans were diminished by the fact that none of them become 'progressive farmers' In colonial days, only the man as head of the family and therefore the bread winner was conceived of as a farmer Women could not join the peasant and 'improved farmer s schemes which were the backbone of 'progressive farming [Tadesse 1982 86]

The great majority of rural women are completely unaware of the existence of most of the improved technologies that can help them When information does filter down to the village level, it is usually the men who receive it, either because the extension workers are men, or because it is only the men who have time to sit around at organised meetings where such information is given out Unfortunately these communication channels are rarely used simultaneously to inform the men about the importance of helping their wives through assisting them to acquire improved technologies [Carr in Ahmed 1985]

One UNDP report says

> In nearly all countries agricultural training at low middle and high levels is given to men only This of course produces exclusively male instructors instructors who, in turn address themselves to the male farmers, over looking and disregarding women, even in cases where the wives daughters and hired female labour are doing the work [ILO cited in Cain 1981 37]

In Tanzania, for instance, extension services (composed of male agents) on agriculture rarely reached the women fully involved in cultivation [Carr 1982] Another study done by Staudt (1978) revealed that from 212 small farm households roughly half of them are solely managed by women who had never been visited by agricultural officers, compared to a quarter of the jointly managed farms that had failed to be visited [in Ventura-Dias 1985]

Women's access to training in productive skills is primarily focused on cooking and sewing There is hardly any training or courses directed to women which have to do with technology particularly improved technology in production It is to some degree due to the bias and prejudices about women and technology The sexual bias in the channelling of extension services is so pervading that technical assistance experts have trained men in activities that were entirely women's responsibilities, like what happened in one west African country Government extension personnel trained men in appropriate coffee planting techniques even though this task was the responsibility of the women [Carr 1985] For instance men are trained to construct and use pumps wells, filtering systems etc, despite the fact that it is women who traditionally were in charge of supplying water [Karl 1983] Moreover, stereotypes that women cannot manage technology are reinforced by the fact that illiteracy is more widespread among women who, therefore cannot read instructions This situation of unequal access to new techniques and institutions is reproduced through the nature of existing educational institutions as Tadessee argues

> New techniques based primarily on know how such as application of fertiliser or the use of improved seed varieties obviously do not carry an inherent sex designation for utilization But to a certain degree the acceptance and use of improved agricultural methods depends on education And unequal education for the sexes with primarily boys sent to school or boys remaining in school longer than girls creates an ever widening gap between the sexes [Tadesse 1982 87]

It is apparent from the discussion above that not all groups in the society have the same access to resources Access to factors of production is much easier for some groups than for the others With regard to women, they are systematically denied access to land rights resources skills training, farm inputs knowledge extension services and the modern means of production All of these factors are of significance to women as they determine outcomes of a new situation like technological innovations The presence or absence of one of the factors may cause a great difference to the women concerned

The continuous exclusion of women from getting access to vital resources which can enhance their position in the face of technological innovations have marginalised them Marginalisation according to Grijns is

> The process by which power relations between people change in such a way that one category of people is increasingly cut off from access to vital resources (land and water capital employment education political rights and so on) which become more and more monopolised by a small elite [Grijns et al 1992 11]

If we relate this with Sen s bargaining problems model then the denial of women's access to strategic resources can be seen as a result of the specific pattern of gender relations That influences bargaining position of both parties in ways that "differentially bias the cultivation of skills and sustain asymmetry of opportunities offered for acquiring untraditional' skills" [Sen 1985 8]

The obstacles that rural women face with regard to acquiring new technology show that the social and political context in which new technology is introduced is of greater importance than the nature of technology itself The fact that it is women who often tend to lose or gain less from a project than the men of their class relates less to the technical characteristics of the project than to the ideology that legitimises and reinforces women's subordinate position economically and socially both in the household and in the larger society [Agarwal 1985] As Agarwal puts it

> The problem of technological change cannot be located in the technological innovation *per se* since what is often inappropriate about the innovation is not its technical characteristics but the socio political context in which it is introduced (1985 112)

However one must also bear in mind that this does not hold true for all cases of technological change In some cases, there is technology which in itself is inappropriate Many reproductive technologies for instance may be inherently bad for the human body Additionally it is bad for women because it is thrust on women An other example deals with what eco femininism is concerned about Some new technologies generated do not concern the environment at all In Java for instance the increasing use of fertiliser and pesticides in agriculture has in some cases polluted the ground water Women who very much depend on this source of water for their productive as well as reproductive tasks have to face this problem There are cases where polluted ground water has caused deaths among rural population When one deals with questions like who produces the technology and for whose benefits one could argue that only certain technologies are generated and become available because of the power technocrats and business corporations hold Choice of technology introduced therefore can be due to power relations in the society But in all cases their effect is always mediated by the social relations including gender relations

III
Small Industries and Technological Change

As can be seen throughout this discussion examples of impact of technological change are available mainly from agriculture There is not enough material on women in small scale industries undergoing technological change

With regard to women in small scale industries and technological change the few studies done in this area have confirmed that technological innovations are usually unfavourable to women In batik industry, for instance, when the copper stamp (cap) was introduced, this became a men's tool and it led to men taking over the task which used to be done by women using the canting method [4] Along with this change wage differentials also widened Stamping was then ascribed as 'heavy' and requiring 'more skills', therefore it was paid more, four to six times more than other tasks performed by women, such as canting work and finishing work [Joseph 1987, Wieringa 1981]

Changes in market demand for batik that were artistic paintings resulted in producers going back to 'traditional technology' that is the use of canting, a tool which used to be considered as women's tool and the making of batik traditionally was 'women's work' This new style of artistic batik has now acquired the label 'skilled' and is now done exclusively by men in small workshops [Wieringa 1981]

Another case is the introduction of new products and new designs in the rattan handicraft in west Java [Smyth 1990] Here technological change has resulted in increased differentiation among producers and consequent marginalisation of females Experiences in central Java show however that it is possible for women sometimes to be able to reclaim their economic position as time goes by

The impact of technological innovations on women thus varies depending on several factors One of the factors is the selection of the technology Technology selection is determined by access to available technologies Another factor, which is also important is the social condition in which new technology is introduced Examples from agriculture show that many detrimental effects of technological change to women are not caused by the technology itself For instance the introduction of new rice varieties which was technically supposed to create jobs for women did not in effect happen because new varieties were introduced together with mechanisation The supposedly positive impact of the introduction of the new varieties on female employment got neutralised by this mechanisation

One must bear in mind when discussing the impact of technological change that not all women are governed by the same social relations In production, employment and social relations which regulate processes may differ from one woman to another There are women who are ruled under specific employment relations such as wage workers and family labour There are also women who work as entrepreneurs The distinct social and employment relations that regulate work for women will determine the effects of a new technique Gender as representation of social relations conveys with it the persisting inequalities as well as the power relations between men and women Specific pattern of sexual division of labour as a product of social organisations will also determine the impact of technology adopted

Although implicit in the social arrangements are the inequalities between the sexes, they are not something unchanging Society men, women as well as the relations among them do and can adjust to a new situation, i e technological innovations as in the examples mentioned earlier —the use of sickles by women and canting in batik making by men Sexual division of labour may break down due to changing situations and which may be advantageous or disadvantageous to women

IV
Javanese Women: Between Ideology and Reality

There is a common perception that Javanese women enjoy a relatively high status and therefore a high level of autonomy and power in the family as well as in the society due to their contribution to the family purse and production [Geertz 1961 Papanek and Schwede 1988] But recent studies have shown that the notion of Javanese women's high status is also contested Wolf (1992) and Djajadiningrat Nieuwenhuis (1987) for instance argue that the power the Javanese women possess in fact is not the real power since the notion of power in Javanese society is different from the notion of power in western culture i e control over income Thus what seems to be the power from the point of view of westerners is not power' in the real sense in the Javanese society Therefore the power' of Javanese women does not carry with it any authority

Javanese Family System

Geertz in her study conducted in Java said that Javanese society is a matrifocal society in which " a woman has more authority influence and responsibility than her husband and at the same time receives more affection and loyalty [Geertz 1961] She went on further to emphasise the close knit relationship between related women whereas the role of male members is comparatively insignificant This matrifocality extends to post marital residence A newly wed couple will usually reside with the bride's family from five to 10 years of their married life [Wolf 1992] Matrifocality does not only apply to the nuclear family but it is extended to other relatives as well [Kerstan 1992] Thus, a woman is central in the family as well as in the society If one follows Tanner's definition of matrifocal, then one sees how essential a woman's position is She defines matrilocal as kinship systems in which the role of the mother is structurally, culturally, and effectively central and this centrality is legitimised

These features coexist in a society where the relationship between the sexes is relatively egalitarian and both women and men are important actors in the economic and ritual spheres [Tanner in Kerstan 1992]

The important role of Javanese women in social matters has been well-documented [Geertz 1961, Hull 1982, Cooley 1987, Kerstan 1992] A Javanese woman is expected to maintain a harmony ('rukun') not only in the family but also a harmony with the neighbours (social harmony) A woman is also expected to maintain the social harmony through rituals and custom This can take the form of a feast ('selamatan') Selamatan is very central in Javanese society Almost every event of a person's life cycle is always commemorated with selamatan It occurs on occasions of pregnancy, birth, circumcision, marriage, death, etc According to Sayogya this feast also serves as "the major form of reciprocal inter-household social and material exchange [cited in Cooley 1987 24] While the role of men is one that is formal and ceremonial, the role of women is one of informality which involves material exchanges like buying and preparing food, and deciding how much food is given to whom Concerning the distribution of food Stoler (1977) argues that the real mediators of inter-household relationships in the selamatan are the women, not the men

However, seeking rukun (harmony) is not something without conflicts Although in principal harmony means co-operation and minimal conflicts direct self-interest works against harmony [Wolf 1992] Seeking rukun may encourage constraint, compromise, and sacrifice Geertz, for instance observed the conflicts in the family regarding inheritance White and Wolf pointed out the intrafamilial conflicts over money and labour [Wolf 1992 61] Thus what is seen as the ideal is not always so in practice

Marriage is a very crucial aspect in one's life cycle in the Javanese society since it shows one's development to a higher status When young Javanese become married, they are said to have reached the rank of 'wis Jawa' (Finally Javanese) [Cooley 1987]

Before going further, it is important to know first about different classes in the society Javanese society is a very stratified society There are considerable differences in the descriptions of its structure [Geertz in Alexander 1987] Koentjaraningrat, for example, differentiated the society into two groups, namely, the peasantry and the elite, and later on he added one more category, i e, the traders [Alexander 1987] Within the peasantry, there is still further stratification based on access to resources, i e, land and capital For the sake of clarity, we can use the terms the poor/rural class and the middle-class (including the elite) This stratification is important to bear in mind since it has a considerable bearing on the way the society organises its social life As women do not constitute an independent class but belong to existing classes, it is of importance to note these differences Norms are different depending on the class the woman comes from

Going back to marriage, the notion conveyed by marriage is of being a wife and a mother Once a woman enters marriage, she has to perform those two roles On the other side the role of a husband or the head of the family is that of the sole breadwinner This view holds true for both middle-class and rural class However, conceptions about marriage are different depending on the women's class standing For the middle class, marriage is a way to beget offspring Being a housewife, for them, is a prestige as it indicates that one is free to choose to stay at home [Hull 1982] Whereas for the poor, marriage is seen more in terms of economic relations

Although the prevailing norms are those which reinforce the high status of being a wife and a mother, for the majority of rural women the reality is very different As the majority of rural women are poor even though they enter into marriage, there is no way for them to just stay at home be a serving and dutiful wife and later on be a good mother They have to involve in gainful employment either as self employed, wage labour or family labour To be sure, to some extent, this gives them a sense of independence

This is borne out in the correlation between divorce patterns and the women's class [Hull, Singarimbun and Manning in Wolf 1992] Divorce is more common among rural and poor women than among middle class women This results from different conceptions on divorce between the two classes of women Divorce carries greater stigma for middle class than for rural women Besides, middle class women tend to avoid divorce because of their economic dependence on their husbands For poor women, dependence on men is less, for economic reasons but more for their motherhood [Grijns 1987]

Thus women from the poor class are more ready to face divorce or separation The divorce rate among lower class for instance in eastern Java was 47 per cent based on the 1953 official statistics [Kerstan 1992 132] However, this rate has been declining from time to time Kasto, in his study done in Yogyakarta in 1982 reported that the divorce rate was 10 per cent [in Kerstan 1992] Another study done in 1992 by Berninghausen and Kerstan (1992) showed that the divorce rate in their village of study was 17 per cent The decline of divorce rate is due to new laws governing divorce as well as the continuous state propaganda in reinforcing the role of a woman as a supportive wife, a good mother, and an impeccable housewife [Wolf 1992, Wieringa 1993 Lembaga Studi Realino 1992] There is a strong influence of the middle class norms which see a woman's role solely as a good mother and wife The image of this ideal woman is also reinforced through state run women's organisations In their programme, they emphasise the important double role of women in the family Although the ideal image and the norms are of a woman being a wife and a mother in reality the majority of women are also family providers

Some writers prefer not to use the concept status since it is not clear in definition and may raise confusion Instead of status, Sanday suggested authority' and power' The first implies the right to control the use of joint resources and the lives of others whilst the latter indicates the ability to influence decisions made by those with authority [Sanday in Whyte 1982] Stoler prefers the use of the terms female autonomy which signifies the extent to which women exercise control over their own lives and have social power The latter is the extent to which women exercise control over the lives of others [Stoler 1977] Here, I will follow the definition of status as female autonomy and social power proposed by Stoler

A woman's status in the society is usually linked to her role in production In some tribal societies for instance where men and women work for subsistence the women have as equal status as the men In early China women enjoyed a relatively high status when they were food gatherers [Lang in Whyte 1982] Some see feudalism and colonialism as having contributed to the deterioration of women's status in the society is women are relegated to subsistence production while the men work on cash crops [Boserup 1970] However this is not always the case The colonialisation period in Java for instance is pointed out by Stoler did not decrease women's economic contribution in productive activities Thus, according to her it is not the type of production but the productive relations involved which are more important for social power

In Javanese society status is conditioned by class standing In Javanese settings, status is linked with the possession of land Due to the increasingly stratified agrarian economy as a result of intensification in paddy production land has become concentrated in the hands of a small number of people It, therefore left the majority of households as well as the majority of rural women without sufficient amount to meet subsistence needs [Wolf 1988] This polarisation has caused widening of the gap in wealth among the peasantry Consequently, it has also widened the gap in status among women

Besides class, status is also linked with generation and age This can be seen through

the language used in the society Javanese has several levels of languages from the most formal one to the most casual (coarse) one The level of language used is determined by the social position of both parties For superiors and older people, a more formal form of language is used Whereas for inferiors and the young the form of language used tends to be the casual or coarse one

Age is also an important determinant in one's status In Javanese kinship terminology relatives are addressed in generation-specific terms and not in sex specific terms [Grijns 1987] For instance when a Javanese addresses somebody s/he always uses terms such as 'younger sister/brother' or older sister/brother

Another aspect which is also an important aspect in determining one s status is gender A husband will address his wife by using the term adik meaning younger sister even though there is no age difference between them In many cases a husband addresses his wife only by using the wife's name Adversely, a wife will address her husband by using the term mas meaning elder brother' or pak meaning father but never does a wife address her husband only by calling his name With regard to that Grijns says that this indicates the association of male with older which is more appreciated than female and younger In this case a clear link is established men s social status is higher than women s (1987 110) In general it can be said that the combination of age and having children in the framework of marriage plus the class standing determines the social status of a Javanese woman

Sexual Division of Labour

Working women in Java especially among peasantry (the group of women we are dealing with in this paper belong to this category) are not something unusual Both men and women work hand in hand for the survival of the family The Javanese, unlike other societies do not automatically consider women to be ignorant and incompetent It is very common for Javanese women to contribute to the household economy Many studies done in Java pointed out that Javanese rural women are very active in gainful employment and this has become an attribute of Javanese women s relative high status [Geertz 1961 Papanek 1987 Hull 1982] A woman who does not work while she is in fact capable is considered to be lazy and will be looked down upon by other women

Despite women s participation in the household economy the traditional sexual division of labour which is apparent in Javanese society is the association of women with reproductive work such as child care and domestic chores, and men with productive work The implications of this division to women are two-fold while women on the one hand have to participate in gainful employment, on the other they also have to do the household tasks such as domestic chores and maintenance of the households This has resulted in double burden for these women The perception of gender roles in Java is one of ambivalence A woman is expected to make economic contribution to the household income, yet they are perceived to have the sole responsibility for the material and psychological well being of all household members It is the woman's economic responsibility to carry the household through bad periods

Women's incomes primarily go to the fulfilment of day-to-day maintenance and men's earnings go to larger but more casual expenditures such as school fees or the purchase of consumer goods [Smyth in Utrecht 1989] Consequently, women tend to engage in work which is less risky but gives steady income However, this pattern of labour allocation within the household is also attached to the social class of women For the majority of women who are usually from landless or near landless families, they tend to have a secure and steady flow of income Whereas women from wealthier and landowning households tend to undertake risky but lucrative jobs which require large capital such as batik and jewellery trading [Papanek 1987, Hull 1982, Utrecht 1989]

Due to their contribution to the family income one can therefore easily draw a false conclusion that Javanese women have relatively high status Yet, if one examines further what actually constitutes 'power' in Javanese notion then one can see that the so called 'economic power' a Javanese woman has, is a 'shadow' power, not real power Javanese has a different notion of power from the western one In the western notion control over money, here extended to economic independence is equated with power Power in Javanese emanates from different sources Power is more about 'good personal traits' rather than the material one [Djajadiningrat-Nieuwenhuis 1987] Thus trading in a market for daily necessities, for instance, dose not carry high status Based on the Javanese beliefs, only men who can achieve inner enlightenment and good personal traits Women, due to their biological function are constrained and trapped in material and social dictates, therefore they cannot achieve inner enlightenment Consequently, women are assigned to worldly business such as gaining material things or involved in income earnings activities [Djajadiningrat-Nieuwenhuis 1987, Kerstan 1992] Thus, it is no wonder that Javanese women are active in their participation in income producing activities

For a Javanese woman, earning money is a must and it is a part of their obligation as a good Javanese What constitutes as 'good' or 'bad' again is conditioned by specific culture of this very society Therefore, earning money does not directly correlate with a Javanese woman's status In fact, it carries with it more burden to the woman

With regard to women's economic power, Errycson said that "such economic power may in fact represent the opposite of power in cultural terms, accruing lower rather than higher prestige" [cited in Wolf 1992 64] Therefore, one cannot directly draw a link between women's participation in productive activities and their status

The discussion above shows the discrepancy in the valuation of women's status between 'norms' and actual practice With regard to Javanese women, they are on the one hand viewed as the sole family maintainers who should put family's affairs above anything else On the other, they are required to be active in gainful employment as well as in social relations This has caused a lot of strain to women, for their burden multiplies This phenomenon holds true for the majority of Javanese women who due to economic necessity, have to function as productive and reproductive workers The multiple burden that the women face will no doubt limit their movements and opportunities

With regard to technological innovations, ideology and norms can be an obstacle to acquire new technology It is tradition that has tended to make modernisation a bit of an 'enemy' to women' [Sen 1987 38] This means that traditional relations between different sexes may create an environment in which technological change will be unfavourable for women This has already been proven for technological change in agriculture My case study focuses on technological change in small scale industrial enterprises

V
The Village Setting

The village Karanggeneng is located at the outskirts of Boyolali town Since 1992, a ring road which connects the capital city Semarang and Surakarta passes through this village Consequently, transportation to and from this village has become quite easy Not only is transportation easy, but also its unique location, i e, its nearness to towns and centres have a considerable bearing on the village economy as well as the villagers' way of life Easy access to and from the village has increased the mobility of the people As a consequence, people from the village may go to the nearby towns or cities once there is a demand for their labour or if the employment condition in the village is not satisfactory enough This is apparent from the relatively high wages in the village compared to agricultural work elsewhere in

rural central Java The easy mobility to go to the nearby towns has changed the life style of the villagers, particularly the youth They go to cinemas in towns they wear jeans and other 'urban' clothing which they did not wear before

The population totalled 5 205 in early 1990 of which 2 562 are men and 2 643 are women Most of the villagers have relatively low education Of 4 741 inhabitants who are above school age 3 747 or 79 per cent received education at primary school level or lower The relatively low educational level of the people limits their employment opportunities in the labour market This can be seen through the kinds of occupation or work they undertake

According to official village statistics of 1987, the occupational situation of its inhabitants can be described as follows From its total population 1 000 villagers or 36 9 per cent are involved in agriculture as either farmers or wage labourers (Table 1) People working in the tile industry were registered as entrepreneurs industrial labourers as well as construction labourers The data was collected by the local government and it is not really reliable It can only be used to give the general picture of the occupation situation in the village Another disadvantage is that village occupational statistics are not disaggregated by gender

The table gives the impression that agricultural work is still important In reality however many are not involved in agricultural work at all due to the small size of land holdings as well as the characteristics of the soil in this village (Table 4 the land holding size) In my research I also encountered people who considered themselves as farmers but who in fact do no farming One must bear in mind that we are dealing with official data in which its reliability is questionable For instance the data does not pay any attention to secondary occupation

The relative importance of tile production as a source of income is shown in Table 2 The data was computed from a survey done by the Faculty of Economics, Satya Wacana on 50 households in the village in 1988 The average annual income of a tile household amounted to 1950 of which 66 per cent came from tile making This means that the contribution of tile making to an annual household income is of significance With regard to land holding size, it is apparent from the table that land holding is very small amounting to 0 26 ha on average This means that most households are not involved in agriculture

History of Tile Making

Tile making has been a traditional work for the villagers This kind of home based industry started a long time ago However, there has not been any documentation on when it exactly started According to local sources, most persons made tiles as children helping their parents in this activity One of the producers said that he had started to make tiles 50 years ago Most of the villagers acquired their skills in tile making from their parents It means that tile making is an inheritance while some others got their skills through apprenticeship They worked for their neighbours or relatives before they started to produce their own tiles

Karanggeneng roof tile industry was one of important sources of income generating activities outside agriculture for many households in the village During the 1970s roof tiles from this village were quite famous and had good demand in the market All producers made standardised tiles using simple technology However, the general improvement in Javanese standard of living in the 1980s [Booth and Damanik 1987] has led to demand for better quality tiles Better quality tiles are more expensive than the traditional ones but they carry with them a higher status and they last longer The shift in demand from traditional tiles to better quality tiles i e press tiles has declined the prospect of traditional tiles market As demand for traditional tiles became limited and they started to lose their leading roles to other regency producers in which the latter have been able to shift to demand for better quality tiles, some innovative producers tried to adopt press machine Due to lack of knowledge in the production it was a failure Characterised by the closing down of some production sites

At the end of 1987, twelve male producers were brought (on the initiative of the Faculty of Economics of Satya Wacana which have been actively involved in research in this regency since 1984) to visit clusters of press tiles producers in other regencies i e Kebumen and Jepara, and to make a comparative study whether the same technology can be used in their village These visits made it possible for them to gain knowledge concerning the use of press machine As soon as it was feasible, credits were given to them Assistance from outside was provided by a local NGO It offered cheap credit to be paid back at favourable instalments Here it can be said that access to information turned out to be a key factor to stimulate adoption of new technology In early 1988 the first press machine was brought into this village It marked the beginning of the new tile production era in this village

According to a 1987 survey, there were 174 households producing tiles [Sulanjari 1990] At that time all households produced traditional tiles, in which the production process is done by using a hand tool From the research done in 1993 on 104 households producing tiles, the pattern of tile producing households has changed considerably From 104 households, 54 households are involved in producing solely traditional tiles, 24 households produce both traditional and press tiles, and 25 produce press tiles only (Table 3) The table also shows the sexual composition of the producers From 104 producers only 24 or one-fourth are women, and they are all producing traditional tiles None of the female producers makes press tiles

None of the households researched own wet land They only have dry land and gardens The average dry land is 106 square metres, and 1 150 square metres for garden (Table 4) This finding is in accordance with one of the surveys done in 1987 on 34 households The average size of wet land-holding was 0 01 ha and dry land was 0 11 The small size of wet land shows that in this village farming is not the main source of income

Production Process

Before going to the methods of tile production it is worth describing the general process of tile production The main input for tiles is clay Some clay pits are communally owned by a group of tile producers, but there are also pits which are privately owned However, due to local government's plan to limit the number of clay pits (for several reasons such as environment protection, building housing complex), more and more producers buy clay from clay producer which cost Rp 15 000 per cubic metre (1 US $ = Rp 2,000) Firewood, which is needed for baking tiles, is usually purchased from traders It costs Rp 60 000 per small mini truck load and it can be used for one time baking only Usually for one time baking which means 5,000 tiles in average (one batch), the amount of clay needed is four cubic metres for traditional tiles, and five and a half cubic metres for press tiles The difference in the amount of clay needed is due to the compactness of tiles As press tiles are more compact, therefore they need more input of clay per unit

Source Monograph of Karanggeneg, Dece[m]ber 1987

There are two production processes of tiles in Karanggeneng The first one is using very simple technology which mainly comprises two printing tools made of wood a piece of wood to rub and smooth the surface of the wet tiles a piece of cord to clean the wet tile from its remaining clay a kiln and the human power The tiles produced by using this technology are called traditional tiles which are different from the other tiles produced by using more advanced technology

The basic ingredients of the two production processes are almost the same They consist of clay and fire wood For traditional tiles, sand and water are needed which are not needed for press tiles production but peanut oil and paraffin instead Traditional tiles' production involves several stages

Stage 1 The clay which is usually still in the form of a big clump is cut by using a cord This smaller clump of clay is then put on a piece of printing tool with the person stamping her feet on it so that the clay will be printed on the printing tool The longer the person stamps the clay and the heavier she is, the better the result is as good tiles are those which are compact

Stage 2 After the clay has been printed and becomes sheet clay piece by piece is then put on another printing tool (this is different from the first one The printing tool here is the one which has the shape of a tile) By using a piece of blunt wood the clay is rubbed and smoothed

Stage 3 Another piece of cord is used to clean the printed tile from its remaining clay

Stage 4 This new wet tile is then put on the ground by standing it so that it gets aired At this stage, the tiles remain in that position for one day so that they are hard enough

Stage 5 The following day, the tiles are put on the sun for two days before they are ready to be baked At this stage if there are cracked tiles then they are mended first

Stage 6 The sun-dried tiles are then put in the kiln The baking process of tiles takes nine hours

The making of press tiles also involves several stages The difference is that here, stage 1, 2, and 3 of traditional tiles production are combined all together so that it becomes 2 stages To make it clearer all stages in the press tiles production processes are described as follows

Stage 1 A clump of clay which has been mixed by using a clay mixer is taken from a big one and then hit by a big hammer so that it becomes a sheet of clay

Stage 2 This sheet clay is then put at the press machine and then pressed

Stage 3 The wet press tile is then put on shelves to get aired

Stage 4. As the tiles harden enough, they are then cleaned from its remaining clay (scraping).

Stage 5 The following day, the tiles are put on the sun for three days to get hard

Stage 6 As they get hard they are then put in the kiln to be baked Like traditional tiles, the baking takes nine hours

The production of one batch which consists of 5000 tiles, normally takes 10 working days However the working days needed can vary among producers as well as the type of tiles, i e traditional or press One factor is the use of workers If more workers are used then the amount of 5,000 can be reached in fewer days Another factor is the type of tiles If press machine is used then the amount of working hours and days needed is less than if press machine is not used Besides press tile producers also make use of more labour especially paid labour and they use it more intensively As a consequence the standard amount of 5 000 tiles can be produced in 156 working hours while the same amount of traditional tiles needs 200 working hours [Sulanjari 1990] The unit price of tiles goes up from traditional to press and (recently) to cement tiles [5] Traditional tiles' price ranges from Rp 40 to Rp 55 per unit while for press tiles it is Rp 60 the cheapest up to Rp 90 the highest per unit

In traditional tiles production all stages but the last one are done by women In all households which produce tiles women are always doing the traditional tiles production The characteristics of women who work in traditional production vary Age for instance ranges from 12 years up to 80 years with the average age is 44 4 years Whilst in press production, the average age of women workers is 36 years with the youngest being 20 years old and the oldest 48 years old

The situation in press tiles production is quite different Here the labour used is usually male labour Of course there are households producing press tiles which employ women, however, their number is limited Furthermore the women workers employed here usually only do the scraping, i e, cleaning the dried tiles from the remaining clay and sometimes do stage 1, i e hitting a clump of clay so that it becomes a sheet clay The rest is done by male labour Therefore, the number of women workers here is small compared to their male counterparts The average female workers used in press tile production is 0 92 compared to their male counterparts which is 3 27 (Table 5)

The use of workers, either family or wage workers or both show the scale of production The average use of workers between female and male producers is different Female producers usually use more of family labour and less wage labour The use of family labour amounted for 2 08 and wage labour 0 6 respectively Female producers also use less wage workers than the male producers from either traditional press, or combination producers The average use of wage workers is 0 6, 1, 4 25, and 3 8 respectively In general female producers use less labour than their male counterparts It means that the scale of production of female producers is smaller than that of men In other words female producers only operate at a small level of production of scale

Roofing tiles are the dominant roofing material for housing in urban as well as rural areas in Java The market for roof tiles is part of the larger market for construction materials The consumers for traditional tiles are different from press tiles The buyers for traditional tiles are usually neighbouring villagers For them the quality is not that important, for they are constrained by their income Whereas the buyers for press tiles are more varied They come from rural as well as urban areas

There are three distribution channels used in tile marketing The first is by the use of out contractors juragan In this case the out contractors provide the inputs including the machinery As producers (to be more exact wage workers) do not provide anything except their labour power they depend entirely on the out contractors The out contractors can decide the price of tiles to be bought from the producers Therefore, the price of tiles in cases like this is the lowest The second one is the use of middlemen makelar' A middleman does not have the right upon the tiles He functions only as a mediator between the buyer and the producer He makes profits by marking up a certain percentage of the price of tiles at the market price However, due to the easier access to the production sites in this village in which final buyers can buy directly from the producers, the service of middlemen has

TABLE 2 HOUSEHOLDS IN KARANGGENENG 1988

Tile households	12	5 3	0 33	1950	66
Other households	38	6 1	0 23	2003	0
All households	50	5 9	0 26	1991	28

Source Sandee and Weijland 1989

become less significant Lastly is direct distribution, which means that producers have a direct transaction deal with the consumers This kind of marketing is most popular because producers can get the optimal price so that the profits are also high From a study done in 1991 on 34 producers, 15 per cent used the service of out contractors 34 5 per cent used the service of brokers 26 5 per cent used direct distribution and 14 per cent for others such as material shops [Timotius 1991 25]

Tile making is of significance as a source of income for the villagers It is apparent from the contribution of this activity to the household's annual income compared to other activities The data also shows that differentiation among producers has taken place While in the past all producers made traditional tiles after the introduction of hand operated press machine they have produced either traditional or press or traditional and press tiles The adoption of the new technology has also led to specialisation of tasks between men and women Women are specialised in the making of traditional tiles while men are in press tiles production

VI
Women as Entrepreneurs, Wage Workers, and Family Workers

There are three kinds of women's involvement in tile production Some women are involved in the production as independent producers which means that they manage their enterprise or they have relatively high control over the production compared to their husbands There are also women who work under certain employment relations such as wage workers and family workers

Female producers usually produce tiles on the backyard of their compound They start to work after finishing the daily chores such as cooking washing and fetching water Usually they start between seven and eight in the morning They do not go to the market for food and other daily household necessities as there are vendors who come to visit their compound They work until three to four in the afternoon Their working times are not so rigid as they can stop for a while to rest or to tend their children This is the normal pattern of their work

With regard to the adoption of hand press machine in this village their working pattern has not been disrupted as they do not shift production They remain producing the traditional tiles Their working load is more or less the same after and before the adoption

As independent producers, they have control over their own enterprise They can decide when they want to produce, at what rate, and how many workers they will employ The more important thing is that they also have access to the profits they obtain from their business Included in this category of women are women-headed households who produce tiles and control and manage their own business As can be seen from Table 6, all of female entrepreneurs produce traditional tiles Moreover they produce tiles on a small scale as it is apparent from the number of workers used (Table 5)

Why has there not been any female entrepreneur who has adopted the hand press machine? The explanation has to do with obstacles the women face Obstacles here can be norms the notion of appropriate roles about what a woman is supposed to and should do As has been mentioned earlier even though a Javanese woman is supposed to be active in income earning she should not exceed her husband in many ways income, or social status New technology does not only carry a high status but it also carries male's prejudiced view that only men are capable of dealing with new technology

Many female producers did not adopt this technology because they do not want to be viewed as wanting to overstep the men' or they would be considered as women who could not accept their karma kodrat' They keep producing traditional tiles on a small scale because for them it is more than enough On the one hand they can contribute to the family purse on the other they do not threaten their husband s standing Such a view is also in accordance with the answers given by the women when they were asked about the characteristics of a good woman Many of them said that a good woman should be able to work hand-in-hand with her husband, submissive and acquiescent 'nrimo' Conversely their husbands also do not encourage them to undertake hand press production

> Ibu Darini is a traditional tile producer She has been in this business for 15 years Her husband works as a tile middleman When asked why she did not use hand press machine while many of the producers have been using it, this is her answer
>
> press machine what for? it is not necessary for me (mboten usah) Making traditional tiles is enough and convenient Besides to make press tiles, one needs a large amount of capital "

Indicative from the above answer of the female producer is the obstacle which has to do with capital To adopt this new technology, one needs a large amount of capital for their standard The machine plus the installation will cost them Rp 1,000,000 to Rp 1,500,000 For women this large amount of capital is impossible to finance by themselves They cannot ask for the capital from their husbands due to what has been mentioned above The only way to finance it is through loans Loans can be from legal institutions such as banks and from nonformal ones such as non-government organisations (NGOs) moneylenders, and bengkel '

Although there is officially no discrimination against women who will ask for loans or credits from banks, the fact is that most women never visit banks let alone borrow money from them The male bias in lending money to women prevails everywhere This is also the case found in this industry The NGOs agents as well as the bengkel producers only give credits to the male head of households

Cultural norms have become a barrier in the adoption of new technology by females Cultural norms about the appropriate roles of men and women have resulted in male bias in disseminating the information of the new technology in the first place Only the men who got access to the hand press machine In addition, the same norms also hinder women from getting access to capital Access to capital as well as access to information are the immediate hindrances that one can immediately recognise, but what lays under it is of most important, in this case cultural norms and ideology

Technically women are able to handle the press machine as it is not something difficult This has been proven elsewhere in rural Java However, the prevailing norms as well as the prejudices exist with regard to new technology have hindered them from adopting the new machine

Another tentative explanation, which still needs to be further verified, regarding the absence of female entrepreneurs who produce press tiles is that there might have been traditional female entrepreneurs who adopted the new technology, i e, hand press machine, but as soon as tiles had become commercialised, the husband took over the control of the enterprise, therefore, the status in the production was no longer a

Source Own data, August 1993.

independent producers but family labour There have been some pointers this lead to that occurrence First is that the cultural norms as has been previously mentioned imply that a woman's standing is supposed to be lower than her husband As new technology conveys high status then it is supposed to be the man in the household who takes command of it Secondly are the prejudices concerning women's capability in dealing with machine Third the fact that there are no female entrepreneurs who produce press tiles and the last one is the fact that female entrepreneurs only operate with traditional technology

Similar to the daily pattern of other women in the village the women who work as wage workers[7] in tile making also start their day before dawn They then go to the river to wash clothing and fetch water and then they go home to prepare the meal for the family for the whole day They also have to get the children ready for school If they have non school age children then it is very common that they will bring them to their working place Their husbands occasionally help out but the women bear the responsibility

There are two types of female wage workers in tile production those who work in traditional tile production, and those in press tile production As has been mentioned in the previous chapter their tasks are different in the two production processes In traditional production they are involved in the whole process except baking while in press tile production they are only involved in a few tasks such as scraping and making sheets clay

Two kinds of payment are applied The first is payment on a piece rate basis The amount of income a worker can get depends on the number of tiles they produce The more they produce the more income they get The second type of payment is based on daily basis Thus the number of tiles they produce does not influence the amount of wage they get

Both payments are applied in traditional as well as press production In traditional tiles production, although many use a piece rate basis but a considerable number of workers are still paid daily From 33 producers who employ wage workers 12 or more than one-third pay their workers daily (Table 6) From the table, it is apparent that more female wage workers are employed in this traditional tile production (36 people) compared to male workers (15 people)

In press production almost all workers are paid based on a piece rate basis From 27 press producers, 21 or 77 per cent apply piece rate basis The use of male workers here is more prevalent than female workers The number is 82 and 23 respectively It means that in press production for every three male wage workers there is one female wage worker employed Besides, the women workers who are employed in this production are usually those who are still young (the average age is 36 years old) The wide use of this kind of payment and the employment of young women are intended for more intensive use of labour in the production of tiles This is in accordance with the purpose of the introduction of new technology that is to increase labour productivity

There is also a wage differential between producing press and traditional tiles although they are paid based on the same category For press tiles the average payment per unit is Rp 9 35 for men and Rp 6 for women The average unit a worker can produce in one day is around 600 700 unit tiles Thus in one day a male worker can get about Rp 6,000 (US $ 3) and a female worker Rp 4,000 (US $ 2) As for daily basis, a male worker will get Rp 4 000 per day and Rp 2 400 for a female worker The wage differential between piece rate and daily basis has made workers choose the first one, but as a consequence they have to work intensively There are only a few male workers paid on daily basis and they are usually those who are quite old For those who are young and able they prefer to be paid on a piece rate basis

In traditional tiles production the average payment for a piece rate basis is Rp 4 15 In one day, a worker can make about 250-350 units Thus she can get an average of Rp 1 350 per day A daily paid worker will get Rp 1 450 In traditional tiles production there is hardly any paid male workers except in baking For baking which lasts for nine hours, a male worker will get Rp 5000 All of the payment mentioned does not include the meal Meals are usually brought from home or in some cases, the employers provide it but then they have to pay for it

The relatively high wages in this village is to some extent caused by its nearness to towns and centres The wage rate here is influenced by the wage rate in towns or cities In order to attract people to work, the wages must be high otherwise they will seek employment in towns

It is clear that there is a wage differential between men and women The wages for press tiles production are higher for both men and women compared to wages in traditional tiles production, but wages for women are always lower than those for men in both traditional and press tile production Overall the wages for men are always higher than the wages for women no matter the workers are paid on piece rate or daily basis If we also consider 'additional wage like cigarettes, then the wage differential will be much greater Some employers also give cigarettes to their male workers ranges from one to five cigarettes a day A packet of cigarettes (12 cigarettes) costs Rp 600 then the additional wage per day will be about Rp 50 to Rp 250 which for them is quite a significant amount

The use of press machine has resulted in increasing demand for both male and female wage workers even though the rate of labour absorption is different The average use of female wage labour in press production amounted for 0 92 and 3 27 for male labour while in the traditional production the average use of female and male wage workers are 0 72 and 0 25 respectively (Table 6) Although press tile production has opened up jobs for both men and women seemingly it creates more employment opportunities for the former than the latter

Regarding the remuneration press producers pay more to the female wage workers compared to traditional ones However, de

mand for their labour is selective They only welcome female workers who are relatively young so that they can use their labour more effectively Moreover, the employment of these females is limited to specific tasks only

With regard to the way they spend their income, a study done in 1991 on 34 tile wage workers showed that on average 62 06 per cent goes to food, 4 24 per cent goes to education, 5 67 per cent goes to housing, 8 58 per cent for social matters ('pirukun') and 10 45 for miscellaneous [see study by Lidia 1991] The relatively high portion of income spent on social matters (with the exception of food) implies that social ties among the villagers are very strong This is in accordance with the Javanese way of living which view social harmony as very important

The same study also revealed that 71 9 per cent of the family income is controlled by the woman and 28 1 per cent controlled by the man However from these 34 households 81 25 per cent had encountered financial problems in which spending surpassed the income It can be concluded therefore, that the amount of income the women have at their disposal is constrained by the small amount of money they get from their spouses

Female family workers are also used both in traditional and press tile production In traditional tile production adult female labour is used at every stage of production For young female labour they usually do tasks which are considered as light such as carrying tiles from the production site to the yard Besides their task in production they also have to do the household chores As other women, they usually finish their household tasks first before going to work

Female labour in press households are also involved in tile production Compared to their counterpart in traditional tile production, their tasks here are limited Usually they do scraping, mending, carrying tiles from the stacks to the yard In cases when male workers are absent, then they also do the pressing However, this rarely happens since there is always at least one male labour, that is the husband In instances like this, the husband will do the pressing while the wife will do the preparing of clay bars

The use of press machine has according to the woman made them more 'relaxed' as they do not have to stamp clay anymore Besides the more use of wage workers in press production has also reduced their burden Their tasks here can now be combined with other daily tasks such as tending their children

With respect to the household's welfare, most of women from this group agree that their household's economic situation is better-off compared to when their households still produced traditional tiles Some of them said that income from this source is reliable The reliability of income from this source is due to the fact that markets for press tiles are wider Most producers do not have stocks

Ibu Siti Kotijah (33 years old) is the wife of Pak Bandi (35 years old) They started to make tiles in 1979 after they got married They have three children Since three years ago they have stopped making traditional tiles and are now producing press tiles There are two male wage labourers who help them in the production When Ibu Kotijah was asked about their family s welfare now I must admit that the earnings from press tiles are bigger than when we still produced old tiles Now finance is more easy (lancar) However we also need a lot of money for we have three children Our needs are many

Dynamics within Households

Women can also be categorised according to the kinds of household to which they belong In tile households they can be divided into four categories They are women headed households women of traditional tile households women of transition households and women of press tile (modern) households These categories may overlap with the three categories of women mentioned before It overlaps in the sense that some of the women mentioned in the first category like independent producers and family workers may belong to one of the four categorie of households However it is of importance to categorise these women in those two ways If we categorise them only according to their relations to means production (entrepreneurs, wage workers family workers) then we will lose insights of the dynamics within the households, how different category of households operate with regard to new technology Conversely if we group them according to only the four categories of households, we will lose one important group of women who are wage workers
